"Engineers under the direction of Mr. W. L. Coulson, manager of the mining department, are now laying out plans for increasing the production of our coal mines at Ladysmith and Comox. We expect to increase the production at least 50 per cent. before the end of this year and two years hence will b in a position to min 10,000 tons of coal daily, or three times the amount now being extracted," said Mr. McRae.

"This, of course, will mean the employment of many hundreds of miners in addition to the present working forces. At present we can not supply the demand for coal and vessels are obliged to await their turn for coaling at the bunkers."

COMPANY NOTES.

AMALGAMATED ASBESTOS.

The annual report for the year ended May 31, 1910, of the Amalgamated Asbestos Corporation, Limited, has been mailed to the shareholders. It shows profits for the year of $517,969.80, after all operating expenses have been met. From this is taken $375,000 for bond interest, leaving $142,969 available on the preferred stock. Only the initial quarterly dividend on the preferred stock has been paid, April 1, thus leaving a surplus of $110,157.30 on the year's operations. The amount available for preferred dividends, if such were required to be paid in full during the first year, would be $11,719 in excess of the amount required. The full year's dividend on preferred stock amounts to $131,250, against an available sum of $142,969 for the year just closed.

At first glance this appears distinctly disappointing, but we are informed that a great deal of necessary development work has been carried on out of earnings, and this naturally would be a severe drain on the revenue for dividend purposes. It is believed that this development work will place the company in an especially favourable operating position, enabling the management to cut down the ratio of operating expenses to gross to a figure very much below the present cost. Properly, however, the major portion of this heavy disbursement should have come from capital account, though if the preferred dividend can be maintained as in 1909-10, the holders of that stock will have little to complain of.

The general balance sheet shows that the company has cash of $5,944 and accounts receivable, $63,598. Asbestos on hand, valued at contract sale prices, totals $621,013. Accounts payable and pay rolls total $121,428, and bills payable $377,662, making current liabilities of $499,090.

The president, Mr. E. B. Greenshields, in his official report, congratulates the shareholders on the satisfactory result of the year's operations, considering how the operations were hampered by development work. He also states that out of the $110,157 surplus will be paid $21,875, two months' interest on preferred stock, and $21,300 for directors' fees, depreciation, etc., leaving $66,982.30 to be carried forward. The company has contracts on hand amounting to $3,637,000.

Mr. Greenshields states that the cost of all the improvements on the different properties will amount to about $250,000 when finished.

Mr. Thomas McDougall, former general manager of the Quebec Bank, has been elected president of the Amalgamated Asbestos in place of Mr. E. B. Greenshields, retired.

The directors elected were: Hon. James M. Beck, Harry A. Berwind, Percy P. Cowans, George D. Crabbs, Theodore W. Cramp, E. B. Greenshields, Robert T. Hopper, H. Malcolm Hubbard, Hon. Robt. Mackay, Howard Ellery Mitchell, R. H. Martin, H. H. Melville, Thomas McDougall, John M. McIntyre and William McMaster.

Mr. P. P. Cowans and Mr. John M. McIntyre replace on the board Mr. Hugh A. Allan and Dr. R. V. Mattison, who have resigned.

Subsequent to the meeting of shareholders, the directors met and

elected the following officers: President, Thomas McDougall; first vice-president, Hon. Robert Mackay; second vice-president, Howard Ellery Mitchell; third vice-president, R. H. Martin; secretary and treasurer, R. P. Doucet.

Mr. Greenshields, in his remarks on the annual report, which was adopted, said:

"The year has been a satisfactory one for the company, especially so when it is remembered that during the first year most of the mines were taken over as separate going concerns, and had to be worked for a good while as practically separate properties, and that the improvements inaugurated had to be done during the producing season, and so interfered a good deal with the ordinary work of the mines.

"These betterments are now nearly completed, and the properties are already showing greatly increased production, the Kings Mines having had a record month in June. This great mine is the company's most valuable asset, and the shareholders should be gratified in knowing that, considering the quality and quantity of its product, and also the great extent of its territory, it is the finest asbestos property in America."

CROWN RESERVE.

The Crown Reserve half-yearly statement to June 30 shows:

We shipped during that period 51 cars of ore, 13 cars being high grade and 38 being low grade, of a total net value of	$709,569.53
Bank interest	2,500.00
Ore on hand	30,000.00
	$742,069,53
Our operating expenses for the same period, including a large amount of development work, were	109,644.18
	$632,425.35
Less royalty to the Ontario Government for the same period	63,861.26
Showing a net profit on our operations for the three months of	$568,564.09
Out of this amount dividends have been paid as follows:	
No. 8 paid 15th April, 1910	$265,322.10
No. 9, payable 15th July, 1910	265,322.10
	530,644.20
Leaving a balance which will further strengthen our substantial surplus of	37,919.89
Surplus December 31st, 1909	$549,275.42
Surplus as above	37,919.89
Surplus at 30th June, 1910	$587,195.31

LAKE SUPERIOR.

The Lake Superior Corporation's fiscal year ended June 30 last. The annual report of the company is now in preparation, and a favourable showing is looked for. For the past year the corporation has been improving and expanding its plants, and constructing new works for the diversification of its products. Most of this new construction work is now nearing completion, and the earning power from now on will be practically doubled. The Lake Superior Corporation has sufficient business on its books to keep its plant fairly well employed to the latter part of November. One of its largest consumers is the Canadian Pacific Railway Company, which gives the corporation practically all of its steel requirements. For the past few years the Canadian Pacific has placed on an average of close to 90,000 tons of steel rail orders a year with the Corporation. The growing demand for structural steel has brought the attention of the Lake Superior Corporation's management to the necessity of constructing a structural steel mill, with the result that a mill will be built in the near future. The Dominion Steel Company is now receiving the bulk of the structural steel business, but when the new mill of the Lake Superior is completed, the management expects to get its share of the structural orders placed.

ACADIA COAL COMPANY.

New directors for Acadia Coal have been elected as follows:—Sir Montagu Allan, president; Emile Francqui, of Brussels, vice-president; H. S. Holt, second vice-president; Mr. Beaudry Leman, secretary-treasurer.

The other directors are: Mr. Charles S. Hosmer, Hon. R. Dandurand, Martial Chevalier, Andrew A. Allan, Hubert Biemans, Colin Campbell, Lambert Jadot, of Brussels, and Bryce J. Allan. Mr. C. J. Coll remains general manager.

As announced some time ago, Belgian capital has been interested in the property, and about a million will be spent improving the property.

CONIAGAS MINE DIVIDEND.

The regular dividend of three per cent. quarterly on the stock of the Coniagas Mines, Limited, will be paid on the 1st of August, in accordance with the resolution passed at the last meeting of directors.

STATISTICS AND RETURNS

VAN ROI.

Cable:—"Mill report for the month of June:—Total amount rushed 3,013 tons, yielding 120 tons of lead concentrates, assaying 142.4 ounces silver, 54.8 per cent. lead, 14.8 per cent. zinc; nd 170 tons zinc concentrates, assaying 38.0 ounces silver, 1.3 er cent. lead and 45.3 per cent. zinc. Total approximate value, 12,303 (£2,537). Mill ran 536 hours. Estimated expenditure or corresponding period on development, ore production and illing, $13,430 (£2,769). South reef, No. 4 level—Along the anging wall eastwards advanced 49 feet, low grade; westards, 128 feet. Average width is 4¾ feet; average value is 8 ounces silver, 7¾ per cent. lead, 12 per cent. zinc. No. 3 evel towards south reef advanced 63 feet."

SILVER MARKET.

Samuel Montagu & Company write under date July 14: The ringency in delivery to which we referred last week, became tensified; so much so that it could be described only as a corner to which the market had been engineered by the Indian speculative group. Anxiety to profit by the high prices paid by the government brought about an actual shortage on this side; but the storage of one or two millions of actual silver deliberately withheld from the market, stamps the present situation as artificial.

The effect of the squeeze on the price of spot silver was to raise the quotation to 25⅝ on the 9th and 11th inst. This is the highest price for over two years, namely, since March 20th, 1908.

The corner had been rendered practicable by bear sales of forward silver having been made some two months back to the extent of about a million sterling. These sales were not speculative in the ordinary sense of the word, but were made in the course of business as a hedge against exchange, and similar sales have been on many previous occasions bought in or carried forward when due, without appreciable disturbance of values. But, in this case, these forward offerings had been bought up, plus all surplus silver ready for delivery, the actual silver was locked up, and the sellers when their sales matured, found that

they had been caught napping and had to pay anything from two to four per cent. for the purpose of meeting their obligations.

To bring about this stringency large speculative risks have been taken, and are still borne by the group responsible for the corner, who have not unloaded any of their huge holdings. To cope successfully with the situation thus created, a favourable market must be awaited, and, if that be practicable, there remains the delicate operation of feeding the demand rapidly without provoking a fall in prices.

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending July 23rd, and those from January 1st to date:

	July 23. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	.....	180,617
Buffalo	50,010	1,183,678
City of Cobalt	.....	422,735
Chambers Ferland	59,400	960,600
Cobalt Central	.....	293,286
Cobalt Lake	.....	260,900
Cobalt Townsite	.....	116,860
Colonial	.....	148,900
Coniagas	60,400	926,056
Crown Reserve	203,900	3,794,558
Drummond	.....	664,200
Hargraves	.....	221,170
Hudson Bay	.....	297,835
Kerr Lake	300,142	5,879,958
King Edward	.....	221,296
La Rose	227,400	6,925,941
McKinley-Darragh	95,240	1,870,689
Nipissing	484,600	6,478,867
O'Brien	.....	758,086
Peterson Lake	101,710	432,420
Provincial	.....	65,000
Right of Way	75,900	957,647
Silver Cliff	.....	159,990
Timiskaming	.....	1,002,570
Trethewey	49,260	641,110
Waldman	.....	63,992
Wyandoh	.....	48,300

Ore shipments for the week ending July 23rd were 1,716,962 pounds, or 858 tons.

Total shipments from January 1st to July 23rd were 34,977,261 pounds, or 17,488 tons.

Shipments of ore from Cobalt camp for the week ending July 16th consisted of 1,095,300 lbs., or 548 tons, divided among nine mines. Kerr Lake and Nipissing were the big shippers. Rather infrequent shippers represented were the Townsite and Hargraves mines. Since the first of the year the camp has shipped 33,260,299 lbs., or 16,630 tons. Shipments for week and year in lbs. of ore are:

	July 16. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	.....	180,617
Buffalo	54,000	1,124,668
City of Cobalt	.....	422,735
Chambers Ferland	64,000	901,200
Cobalt Central	.....	293,286
Cobalt Lake	.....	260,900
Cobalt Townsite	48,860	116,860
Colonial	.....	148,900
Coniagas	.....	865,656
Crown Reserve	64,000	3,590,658
Drummond	.....	664,200
Hargrave	41,370	221,170
Hudson Bay	.....	297,835
Kerr Lake	300,000	5,579,816
King Edward	.....	221,296
La Rose	152,000	6,698,541
McKinley-Darragh	95,980	1,775,449
Nipissing	293,000	5,994,267
O'Brien	.....	758,086
Peterson Lake	.....	330,710
Provincial	.....	65,000
Right of Way	.....	881,747
Silver Cliff	.....	159,990

Wyandoh	.....	48,300

QUEENSLAND GOLD RETURNS.

The gold returns of Queensland for June were as follows:

	Tons crushed.	Yield in ozs.
Charters Towers	17,600	(12,900 (*400
Croydon	400	300
Gympie	13,400	5,700 (4,200
Mount Morgan	10,800	(*9,900
Ravenswood	1,600	1,900 (1,900
Other fields	6,900	(*1,100
Alluvial	.....	300
Total yield in ozs.		41,600

The following calls were made and dividends paid:

Charters Towers	£4,800	£15,000
Croydon	600	nil
Gympie	3,700	7,200
Mount Morgan	nil	50,000

—Reuter.

* From copper ore.

NEW SOUTH WALES OUTPUT.

Sydney, July 7.—The gold yield of New South Wales for June amounted to 12,147 ozs., valued at £43,588. The yield for the six months ended 30th June was 100,129 ozs., valued at £360,638.—Reuter.

BRITISH COLUMBIA ORE SHIPMENTS.

The Convention and Lucerne mines made what were probably trial shipments, to the Consolidated Company's smelter at Trail this week. The following are returns of the ore production and movement for week ending July 16th:

Rossland Shipments.

Centre Star	4,049	107,576
Le Roi No. 2	587	18,027
Le Roi No. 2, milled	300	8,400
Le Roi	490	8,458
I. X. L.	8	139
Other mines	.....	258

Boundary Shipments.

	Week	Year.
Granby	20,071	671,503
Mother Lode	6,500	174,705
Snowshoe	2,014	92,379
Oro Denoro	304	7,038
Jack Pot	275	2,971
Other mines	.....	587
Total	29,164	949,183

Total	5,434	142,858
Slocan-Kootenay Shipments.		
St. Eugene, milled	2,775	77,700
Van Roi, milled	800	22,400
Whitewater, milled	250	5,750
Queen, milled	420	11,760
Granite-Poorman, milled	250	7,000
Nugget, milled	110	3,080
Richmond-Eureka	60	2,464
Standard	39	702
Emerald	5	1,097
Sullivan	498	6,972
Queen Victoria	290	1,809
Convention	5	5
Lucerne	3	3
Other mines	.....	35,607
Total	5,505	170,443

The total shipments, including the estimated milling, were for the week, 40,103 tons, and for the year to date, $1,262,484 tons.

B. C. Copper Company's Receipts.

Cranbrook, B.C.

Mother Lode	6,500	174,705
Oro Denoro	304	7,038
Jack Pot	275	2,971
Total	7,079	184,714

Granby Smelter Receipts.

Grand Forks, B.C.

Granby	20,071	671,503
Other mines	.....	120
Total	20,071	671,623

Consolidated Company's Receipts.

Trail, B.C.

St. Eugene, concentrates	138	9,315
Van Roi, concentrates	90	758
Le Roi No. 2, part concentrates.	587	18,027
Centre Star	4,049	107,576
Le Roi	490	8,458
Snowshoe	2,014	92.379
Richmond-Eureka	60	2,464
Standard	39	702

Queen Victoria	290	1,809
Convention	5	5
Lucerne	3	3
Other mines	.....	15,177
Total	8,434	267,465

The total receipts at the smelters, including concentrates, were, for the week, 35,584 tons, and for the year to date, 1,123,-802 tons.

Le Roi No. 2—Cable: "Josie mine report for June—Shipped 2,702 tons. The receipts from smelter are $82,759 (£17,064), being payment for 3,498 tons shipped, and $3,511 (£724), being payment for 183 tons concentrates shipped. In all, $86,270 (£17,788)."

DOMINION COAL FOR JUNE.

Dominion Coal output for June was 359,121 tons.

Shipments, June 1910	337,145
Shipments, June 1909	393,541
Decrease, June, 1910	56,396
Shipments, 6 months, 1910	1,296,125
Shipments, 6 months, 1909	1,245,883
Increase, 6 months, 1910	50,242

SCOTIA'S COAL SHIPMENTS.

Nova Scotia Steel and Coal Company reports as follows for June:—

Shipments, June, 1910	87,938
Shipments, June, 1909	95,950
Decrease, June, 1910	8,012
Shipments, 6 months, 1910	330,502
Shipments, 6 months, 1909	274,506
Increase, 6 months, 1910	55,996

BRITISH COLUMBIA ORE SHIPMENTS.

Nelson, July 9.—Interest in Sheep Creek camp continues to increase and many visitors have been on the ground during the past week, but no new deals or strikes of importance have been received at the close of the week, other than those already reported. Ore shipments are well up to the average for the year.

Appended are shipments and smelter receipts in detail:—

Boundary.

MEN OF WEALTH

Are almost invariably the greatest believers in Life Insurance because they recognize the value of a "Cash" estate absolutely secured, and therefore they aim to maintain a considerable portion of their estate in the form of Life Insurance.

The North American Life Assurance Company appeals to business men because of its long record of success and its able and progressive management.

Assets, over $10,500,000. Net Surplus, over $1,000,000. Good Agency openings for energetic men.

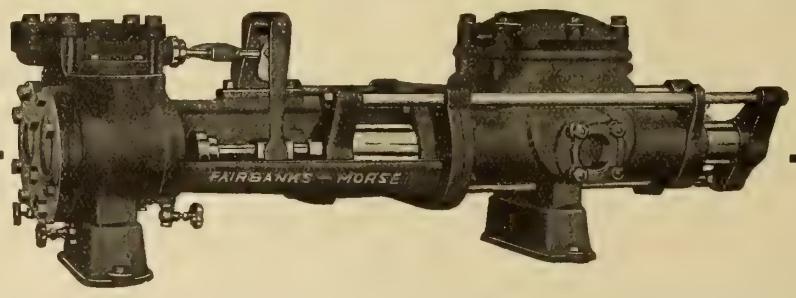
A Revelation

THE CF Co LTD

We firmly believe that the Economy effected in Steam Consumption and the Steady, Reliable Service given by Fairbanks-Morse Steam Pumps will prove a revelation to most engineers.

The design is fundamentally correct, as the pump relieves itself without setting up internal strains. There is an entire absence of short stroking, straining, or blowing out of valves so noticeable in some pumps when working under heavy load.



We build Fairbanks-Morse Pumps for Steam, Electric or Belt Power. Also Underwriters' Pumps.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE FOLLOWING GEOLOGICAL MAPS HAVE BEEN RECENTLY ISSUED:—

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1025. Waverley Sheet. Scale 1 mile to 1 inch.
1037. Windsor Sheet. Scale 1 mile to 1 inch.

QUEBEC

1079. Geological and Topographical Map of St. Bruno Mountain, Chambly Co., Que. Scale 800 ft. to 1 inch.

ONTARIO

1076. Gowganda Mining Division. Scale 1 mile to 1 inch.
1061. Explored routes in a portion of North Western Ontario, traversed by the National Transcontinental railway between Lak Minnitaki and Lake of the Woods. Scale 4 miles to 1 inch.

ALBERTA

1032. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland. Scale 400 feet to 1 inch.
1004. Geological Sheet, Rossland Mining District. Scale 1200 feet to 1 inch.
1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1105. Map No. 4A. Geological—Golden Zone Mining Camp near Hedley, B.C., by C. Camsell. Scale 600 feet to 1 inch.
1106. Map No. 3A, Geological—Mining Claims on Henry Creek near Hedley, B.C., by C. Camsell. Scale 800 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1041. Geological Map Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of the ore bodies of the same belt
1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for map on linen.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map o Canada, by G. A. Young and R. W. Brock.
973. Catalogue of Canadian Birds, by John Macoun and James M. Macoun.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotlan Part I, Economics, Part II Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

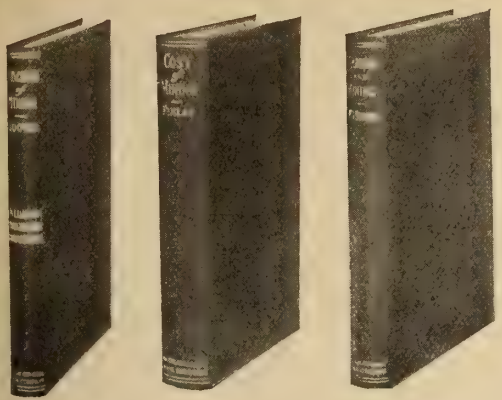
ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon an Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
980. Report on a portion of Algoma and Thunder Bay Districts, by W. J. Wilson, and on the region lying north of Lake Superio between the Pie and the Nipigon Rivers, by W. H. Collins. A map showing the geology along the water courses from Lak Superior to the Albany River and from Missinabi to Nipigon River accompanies the report.
1075. Report on the Gowganda Mining Division 1908, accompanied by a map, by W. H. Collins.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.

YUKON and NORTH WEST TERRITORIES



1050. Whitehorse Copper Belt, accompanied by maps, by R. G. McConnell.
1097. A Reconnaissance across the McKenzie Mountains on the Pelly, Ross and Gravel Rivers, Yukon and North West Territories with map, by Joseph Keele.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economi geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature re ported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

THOS. & WM. SMITH, LTD.

NEWCASTLE-on-TYNE: ENGLAND

MONCTON, N.B.

Westinghouse

Type "H F" Polyphase Constant Speed Motors

Particularly adapted to mine service where the motors are required to start under severe conditions with a comparatively low starting current. Their design embraces the best possible balance of the various necessary operating characteristics:

¶ Air gap between rotor and stator to give safe operation for long periods without adjustment.

¶ Practically uniform efficiency between half load and 25% overload, allowing operation over a wide range of outputs.

¶ Provisions for free circulation of air, assuring cool operation.

Westinghouse "H F" Motors are made in standard capacities from 5 to 500 horepower (larger sizes built to order) for 25, 40 and 60 cycle operation:—See Circular 1152.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

A Ten-by-twelve Tent for $9.90

Made of 8-Ounce Duck

THIS is a photographic illustration of a special tent we have had made on a quantity-order basis. In no other way could we supply a tent of this size and quality of canvas for $9.90.

Made of 8 ounce duck, with double sewn seams and re-inforced strain points.

Used either with an outside ridge pole, or a ridge rope stretched between trees. An ideal prospector's tent with plenty of wall.

Dimensions—Height, 7 feet; Length, 12 feet;
Width, 10 feet; Height of walls, 3 feet.

Complete with guy ropes,..... **$9.90**

Poles and pegs if desired, **95c** extra

A "Black-Fly"-Proof Netting

A SPECIAL FLY NETTING with *smaller mesh* than the ordinary mosquito netting, so that it is proof against Black Flies, and all other insect pests. This netting we have had made to meet a special demand from the north country; per yard—9 cents, or piece of 24 yards for..... **$2.00**

36 INCHES WIDE, WHITE OR GREEN.

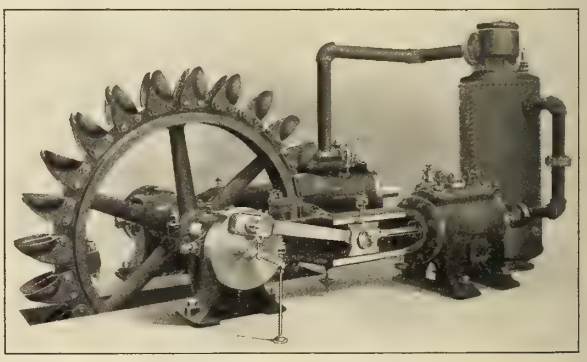
DOBLE WATER WHEELS

In successful operation under heads from 25 feet up to 2,200 feet and in capacities up to 9,000 H. P. from a single jet and runner. The cover has been removed from the runners in these illustrations to show the patented ellipsoidal buckets.



At the right are two of our Worthington centrifugal pumps, St. Jerome, Quebec, having a total capacity of 320 Imperial gallons per minute against a total head of 72½ feet operated by one of our Doble tangential water wheels 100 H. P. under 110 feet head.

The illustration in the centre shows the Doble patented needle regulating nozzle. One of our Doble tangential water wheels 180 H.P. under 310 feet head is there shown direct connected to a direct current electric generator. Cobalt, Ont.

At the foot of the page is shown one of our Doble tangential water wheels 237 H. P. under 620 feet head driving an air compressor, Lardo, B. C. We design and build these wheels specially to meet operating conditions and to secure the highest efficiency from the water available.

The John McDougall Caledonian Iron Works Co.

LIMITED

Works: Montreal. Sales Offices: Montreal, Toronto, Cobalt, Winnipeg, Calgary, Vancouver.

BELLISS ENGINES

Have won the approbation of the well informed engineers of Canada: not only the theoretical man, but the practical Commercial Engineer, who has the spending of the money.

When the Engineer has a reputation for safe Engineering to maintain, why does he recommend the Belliss Engine?

BECAUSE—

It is absolutely reliable.

It will go right into service when started up; all its finishing and adjustments having been made in the builders Works.

Its running is ceaseless, noiseless, "cost less."

The first engine of the type built 20 years ago is still running 625 r.p.m. day in and day out all the year round and shows no sign of wear.

Is it surprising that Belliss Engines have been installed by such leading firms, institutions and Cities as Dominion Iron & Steel Co., Canadian Locomotive Works, Dominion Bridge Works, Universities of McGill, Toronto, Queens, Saskatchewan; Cities of Montreal, Edmonton, Lethbridge, Westmount, Verdun, Brockville, Renfrew.

Builders: Belliss & Morcom Ltd., Birmingham, England.

Canadian Agents: Laurie & Lamb, Engineers, Board of Trade Building, Montreal

"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just becanse it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be tne stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we **know**, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs **per year** than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line, As you have everything to gain and nothing to lose, why not investigate NOW?

DIAMOND DRILLING VS. A SUBSTITUTE

The "justasgood" process of ore drilling is advertised as much cheaper than the "real thing"—"just think of the high price of diamonds."

Nova Scotia is a locality, perhaps the only one, where diamond drills and the "justasgood" are used in the same formation, so that a fair comparison can be made of the two processes.

The following "Deadly Parallel" is made up from figures published in the report of the mines department for the year ending September 30th, 1909. *See Canadian Mining Journal for July 15th.*

DIAMOND DRILL		SHOT DRILL
3378	Total feet drilled	2198
$.79	Total cost per foot	$2.17
.58	Labor and management per ft.	1.17
.038	Diamond or shot loss per ft.	.057
13	Rate of drilling per shift in coal formation—feet	6

Sullivan Steam-Driven Diamond Core Drill

Please note, **first**, that the cost of diamond wear was **less** than the cost of shot wear **second**, that labor cost is the heaviest item of all, and that shot drilling was twice as expensive as diamond drilling in this particular.

When **accuracy** and **reliability** are considered, the showing is much more in favor of the Diamond Drill.

Do you need drills or drilling work? Let us send Catalogue 655, or make you a price per foot on testing your property by contract.

Amatite ROOFING

NEEDS NO PAINTING

MOST ready roofings require special painting and coating, and unless this is done regularly, you are sure to have leaks and trouble right along.

If you use Amatite, nothing of the sort is required. You will have real roof protection *without painting* of any kind.

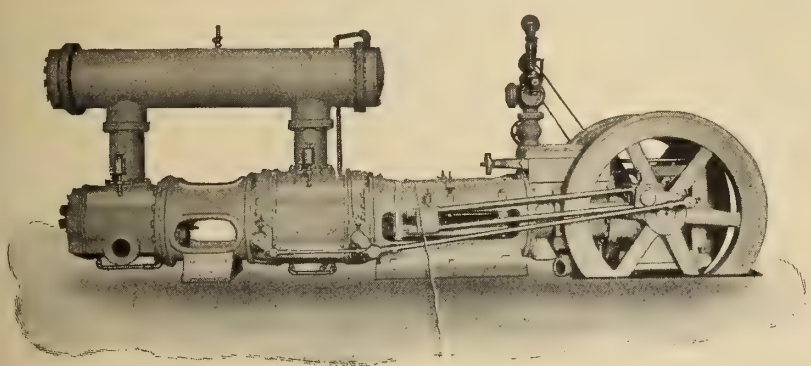
Amatite is made to stay waterproof and give protection year after year, without any thought or care on your part.

First—Because it is waterproofed with Coal Tar Pitch.

Second—Because it has a real Mineral Surface.

Amatite, owing to these features, is the most economical roofing made. Its first cost is low, and you are *saved* all future expense for repairs or paint because it will need neither.

If you haven't seen Amatite, write for a sample to-day. From it you will very quickly understand why it doesn't require painting; why it does not leak; and why it saves you money.



Address nearest office to-day.

Another Victory for the "DEISTER"

We are placing 180 Improved No. 3 Deister Slime Tables and 132 No. 2 Deister Sand Tables in the Miami Copper Company's mill, Miami, Arizona. This large order was the direct result of the showing made by the Deister Tables. The No. 2 Deister competing against all of the well-known makes of tables on the market—The Improved No. 3 Deister competing against vanners.

By eliminating teeth in the roller and rocker arm, our driving mechanism is now the most effective, noiseless and durable on the market.

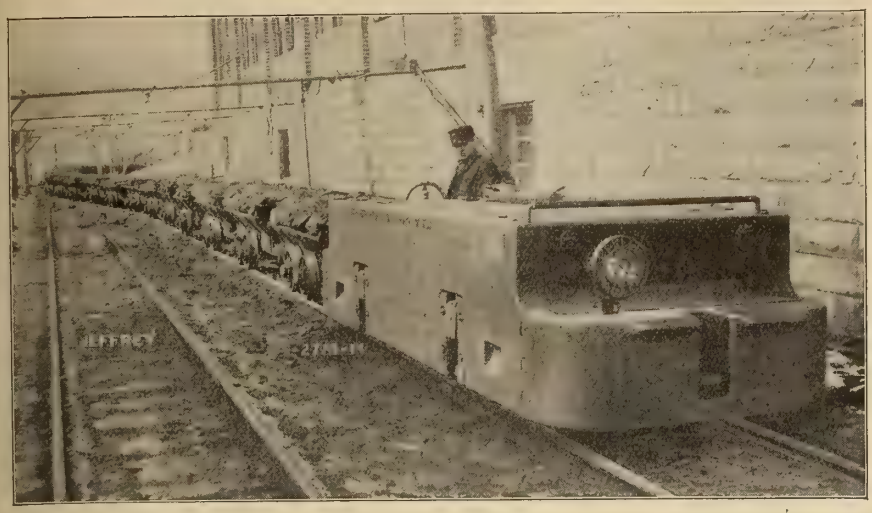
CYANIDE HANDBOOK BY J. E. Clennell



Over 500 pages, 6x9, illustrated, $5.00 (21s) net, postpaid

Mr. Clennell has been in close touch with the rapid developments of cyaniding. He has been instrumental, too, in many important discoveries, and his work in this field has taken him to the leading plants of the world. It deals generally with Cyanide and does not confine itself to the process alone. It is divided into nine main parts covering the subject more fully and exactly than it has heretofore been handled.

Especially noteworthy is the full treatment of recent developments and important phases heretofore *inadequately treated.*

STUDENTS AND EMPLOYERS.

In a series of resolutions the Mining and Metallurgical Society of America has given expression to its opinions upon the instruction of mining students in practical mining. These resolutions we shall quote in their entirety:

> Resolved, that it be recommended to mining and metallurgical operators that facilities be granted to undergraduates of technical schools to inspect the operations of their mines and reduction works; and, moreover, that such undergraduates be afforded the privilege of gaining actual experience in carrying out the various operations.
>
> Resolved, that the instructors in our mining schools be urged to impress upon their students the importance of supplementing their technical education by experience in practical operations and association with working conditions and workmen, both of which are essential to ultimate success.
>
> Resolved, that operators, consulting engineers, and managers be urged to consider the importance of developing and maintaining a trained force of young technical graduates in their various departments, and in taking such graduates into their employment, and be urged to devote the requisite personal attention to these graduates in order to insure the proper development of such assistants, believing, as we do, that this co-operation will be of mutual value to the operators and the graduates by creating a trained force that will be of value to the industry.

The subject having thus been dealt with in a general sense, it is next proposed to go further and to decide such questions as that of the length of time to be devoted to such apprenticeship, etc.

Unquestionably this is a commendable effort. Not only will it safeguard the profession, but it will also tend to improve the breed. To gain practical knowledge of mining and smelting the student relies mostly upon his own luck in getting a "job" during his summer vacation. In the greater proportion of cases he is forced by circumstances to accept work that has little or no bearing upon his future career. Hence valuable time is lost, and energy that should be devoted to the study of his profession is diverted to the sordid task of collecting enough money to put him through college.

It is true that in Canada every effort is made by the professorial staffs to obtain suitable employment for students. To this end mine owners and operators are canvassed early in each year. But results are not uniformly satisfactory. There is, naturally, more or less rivalry between our mining schools. Hence not a few

deserving students are forced to depend upon their own efforts, and often they are left in the lurch.

Incidentally we feel inclined to agree with the statement of one member of the committee that drafted the resolutions cited above. It is his opinion that a firm stand should be taken against the idea that it is necessary or even advisable for a young engineer to engage in manual labour during his course of training. There is no inherent virtue in getting dirty. Certainly a young man must know the value and meaning of a day's work. He should not be unfamiliar with pick, shovel, and drill. But he should realize that this phase of his experience can easily be overdone.

In the main, the practical experience now obtainable by our mining students is of the helter-skelter variety. He may spend one summer in an assay office, another prospecting, and yet another surveying, whilst his object in life is to become a mine manager. His professors can assist him only to a limited extent, and unless the mine manager takes a friendly interest in him, he is compelled to switch his energies into channels that he knows to be unprofitable. We need not expand upon this topic. Our student readers at least will catch our drift.

. . . . . .

There are three bodies upon whom falls the duty of providing better and more uniform facilities for students who require actual acquaintance with working conditions. These bodies are first the professors, secondly the mine managers, and thirdly the Canadian Mining Institute. The latter two bodies may advance the objection that this smacks of paternalism. A little reflection will show, however, that this is not the case. The Institution of Mining and Metallurgy has set a good example. Such of its members as are operators or managers of mines have been requested to take on one or two graduates of designated mining schools. We can well afford to follow this example.

Finally, we would urge most strongly that, instead of fostering the present rivalry, the professors of our various mining schools consult each other with a view to rendering uniform the conditions under which Canadian mining students secure professional employment. This is probably the first and the most important step, and now, near the beginning of the academic session, is the best time. Another consideration makes this step extremely desirable. This is the fact that any recommendations formulated by a convention of professors could be at once submitted to the Royal Commission on Technical Education.

CONCERNING NOVA SCOTIAN GOLD.

Early in August we visited several old gold mining camps in Nova Scotia. Our readers are not unfamiliar with the questions that have been raised concerning gold mining in our easternmost province, and, in the hope that a ray of light may be thrown upon the subject, we shall venture herewith to set down a few general impressions gathered during our visit.

The outstanding advantages that first strike the traveller are the accessibility of many of the mines, the good roads connecting them with their sources of supply, the cheapness and apparent abundance of labour, and the plentifulness of water and timber. To be added to these is the natural beauty of the surroundings, and the relative scarcity of mosquitoes and black flies. So much for the bright side.

In a certain camp that shall be nameless the most superficial inspection shows that something is wrong. A mill test, for instance, consisting of a few tons of ore was about to be put through a five-stamp battery. No steps had been taken to determine the gold contents of the ore, the plates were dirty, the mill was dirty, and, so far as we could learn, it was the intention of the operators to "sweeten" the run with some very rich nuggets that had been found a few days before. All this, of course, was being done innocently. But we have no doubt that the parcel of ore would be credited—equally innocently—with the total yield. Lest we be misunderstood, let us repeat that in the instance quoted there was not the remotest intention of gulling anybody. The facts, such as they were, were explained fully to us. But the result is bad. No real evidence is gained, and, in all probability, the management is confirmed in the practice of wasting time and money in putting worthless quartz through a mill of very limited capacity. If any ore requires assaying carefully and systematically, the narrow spotty veins of this type require it.

Of careful mining there is no evidence. The head frames are of the rudest and clumsiest description. The shafts are badly timbered. The narrow, irregular underhand stopes are unspeakable. They are eloquent of lost labour and wasted time. Supervision, close and careful, is unthought of. The object of one and all appears to be to discuss the whereabouts of the next bonanza.

And it is the search for the bonanzas, the fabulously rich rolls and pockets, small in extent and irregular in occurrence, that not only incites the novice to spend his money, but also destroys the efficiency of the mine as a whole.

There have been two kinds of failures in Nova Scotia gold mining. The one has been due to over-equipment, equipment out of proportion to the possible yield of the mine; and the other is attributable to the feckless gophering of men who do not know what a mine is. Either kind may succeed; but chances are very much against them.

Somewhere in between lies the golden mean. The intelligent study of the ore shoots, the proper development of the mine in relation to these shoots, the elimination of barren ore, the just co-ordination of plant and mine, the utilization of water power wherever possible, and, above all, the keeping of full and continuous ass

ecords, assay maps, and mill returns, will go far toards solving the question of profits.

The conviction is being brought home more and more o us that Nova Scotian gold mining will pay the priate venturer (provided he be competent), where it ill not in many cases yield sufficient profits to the joint ock company.

One hint that no wise person will overlook is this,—ek the advice of the old stagers, men who have lived nd wrought all their lives in the camps, men who are ie sole repositories of the inside history of gold min-ig in Nova Scotia. These men may not be able to adise upon technical subjects, but they can give you with onderful wealth of detail the story of each vein, of very rich shoot, and of every important mill test. In umbers there is safety. From a few such personal naratives sufficient exact data can be distilled to give the ivestigator a start in the right direction.

The gold is there. It remains for the mining engineer o show that the profits are also there.

THE INTELLECTUAL PROLETARIAT.

A clever phrase was coined some time ago to describe hose German university graduates who are turned oose with no practical training. Mr. C. R. Corning ientions it. It aptly applies also to the Anglo-Saxon 'arts'' product. The phrase is ''intellectual proletarat.''

The perennial flood of graduates whose education has itted them for no special calling and has probably hanlicapped them in the race, shows signs of diminishing. Iore and more young men are learning that the counry needs their services in a practical every-day, wagearning capacity. More and more is it becoming unashionable to belong to the ''intellectual proletariat,'' he great unemployable.

If the latest records of our mining schools are to be rusted, the profession of mining engineering is attractng larger numbers than ever before. Mining is essenially a practical occupation. Mining engineering is a rofession second to none. It calls for sound practical xperience, thorough business knowledge, high ethical oncepts, and dignified professional methods. How can ny sane person prefer to enrol himself with the inept nd unfit ''intellectual proletariat,'' when a profession ike this is open to him!

For several reasons we welcome the phrase. One reason we shall give. A certain professor of Latin, a worthy man whose joy it is to stir up unprofitable but highly picturesque rows in academic and religious circles, once dubbed mining students ''educated plumbers.'' No better retort could be devised than the phrase that heads this editorial.

To quiet the still, small voice of conscience we must subjoin this rider. We believe that no young man who intends to take up any profession can afford to neglect the broader university studies. He must not be led to believe, however, that they are anything but stepping stones.

STANDARDIZATION AGAIN.

Mr. T. A. Rickard is not getting off easily. The phlegmatic Englishman is not easily stirred. But he does resent some things. Mr. Rickard, being an Englishman, an Englishman who has suffered much attrition by travel and contact (metamorphic) with his fellows, has taken it upon himself to correct certain loosenesses in the literary habits of his countrymen. He has been at it for some time. But the storm did not break until after the publication of his paper, ''The Standardization of English in Technical Literature.''

In the discussion that follows this paper it is evident that Mr. Rickard will have no bed of roses whereon to lie. Whilst each of his critics is formally commendatory to begin with, each has a club behind his back, and each gets in his lick.

The windiest buffet of all is dealt by Mr. W. H. Shockley. Mr. Rickard had asked: ''Why should we write settle *down,* settle *up,* put *down,* put *up,* why should we not use synonyms for these words?'' The object of the interrogation is to display the superfluousness of the preposition in each case. ''This,'' says Mr. Shockley, ''is the sort of question that properly belongs to a lisping baby. After wandering wearily over the earth we come home and in our arm chair settle down. When we settle up an account we settle it completely; the up is used intensively . . . Condensation. . . is alien to the English tongue, whether written or spoken.''

We hope and believe that Mr. Rickard has met a foeman worthy of his steel—or graphite. The joust should be a merry one.

UNWISE LONDON.

Our London correspondent informs us that the press reports of the Stewart (B.C.) gold discoveries were responsible for the flotation of a company capitalized at $1,000,000. Four hundred thousand shares were issued, at 50 cents. The flotation is reported to have been successful.

This is the way of unwisdom. Already the glowing statements of yesterday have been discredited. English shareholders will have one more reason to regret dabbling in Canadian mining ventures. We repeat the rule (and we have already reiterated this so often that it must be painful to many of our readers) that the person who takes a long-distance shot at a mining venture without disinterested technical advice has no just grounds of complaint if he finds that he has been fooled.

THE LUCKY JIM.

News comes from Nelson, B.C., that the loss by fire at the Lucky Jim mine was not nearly so serious as first reports would have led us to expect. In fact, according to the statement of Vice-president G. W. Loper, the fire consumed only old buildings that were shortly to be torn down, and some timber that had been collected for the construction of ore bins. Work has already been resumed.

Press despatches make special mention of the prompt and effective interest taken in the matter by the Government of British Columbia.

EDITORIAL NOTES.

A financial contemporary predicts an immediate and effectual curtailment of copper outputs. This, it is stated, will be in part voluntary and in part forced, according to the strength or weakness of the operator.

The railway spur to the Whitehorse copper and iron fields is completed. This taps copper and iron deposits of which great things are hoped.

The great Lakeview gusher, California, is yielding about 35,000 gallons of oil per diem. Since blowing in, five months ago, this well has produced 5,000,000 gallons. It is now showing signs of subsidence.

The law compels mine operators on the Rand to keep exact and complete clerical records of all gold, amalgam, and cyanide residues handled and weighted. Two men, at least, must be present during the operations. Other consecutive precautionary measures are taken, all with a view to prevent stealing. Three large concerns have thought it necessary to retain the services of a staff of detectives to supplement the organized protection afforded by the law. This should be the very last step resorted to. It works harm and brings discontent.

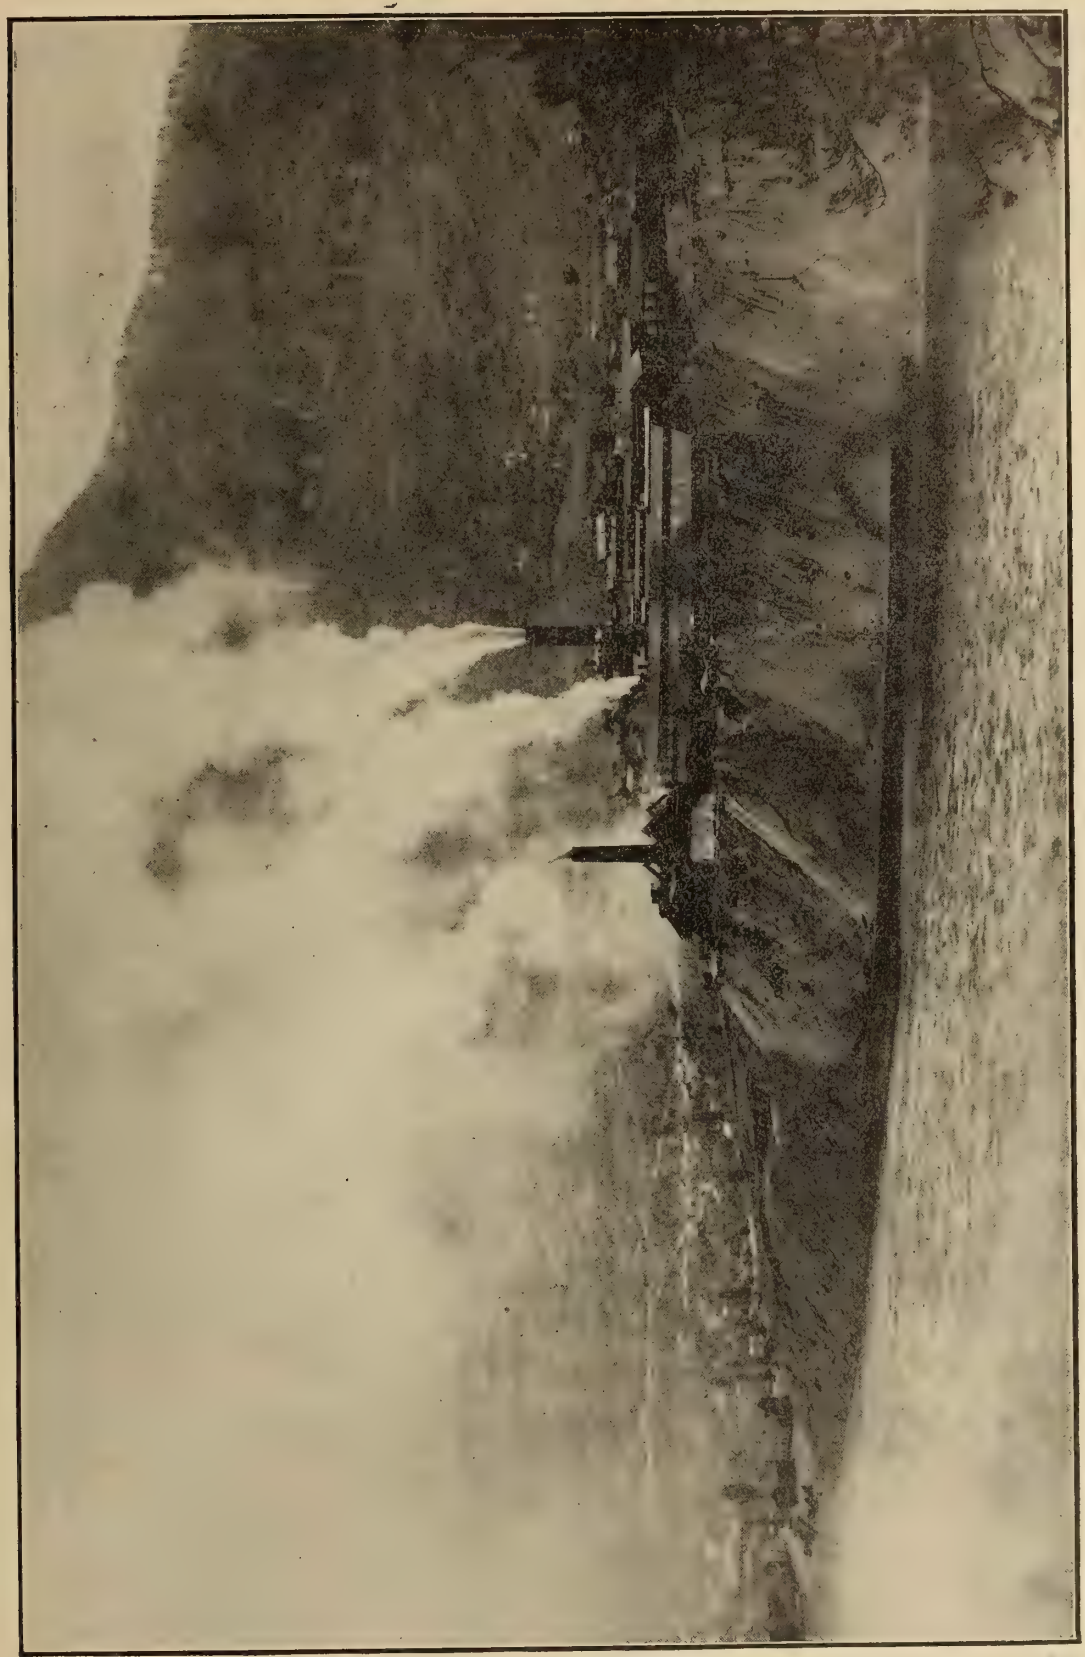
A pure white diamond, 191 karats in weight, has been found at the Premier mine, South Africa. Its value uncut is placed at $150,000.

The striking miners of Greensboro, Pennsylvania, resorted to gun practice. Some thousands of workmen, armed with rifles, prepared to resist the state troops. Canadians may congratulate themselves upon the fact that such a scene is hardly possible in this country. Organized resistance to constituted authority is not popular here. Moreover, despite the growlers, the Industrial Disputes Act is proving to be "good medicine."

At Empire Gulch, Colorado, a 900-foot shaft filled with water to within 80 feet of the collar, is being pumped out by means of compressed air. The compressor is driven by an electric motor which gets its power from a transmission line. The pump can be withdrawn to the surface at any time. The whole arrangement is clean, simple and effective, and there is no danger of losing the pump.

Mr. Roosevelt declined the honour of opening the Toronto Exhibition. He has lately been pressed to attend the forthcoming session of the American Mining Congress. Probably a Canadian Mining Institute smoker would draw the retiring gentleman. It is time for something to happen. The continent's safety demands that someone be sacrificed to provide a safety-valve for the Colonel.

CONSOLIDATED MINING AND SMELTING COMPANY OF CANADA, Limited.



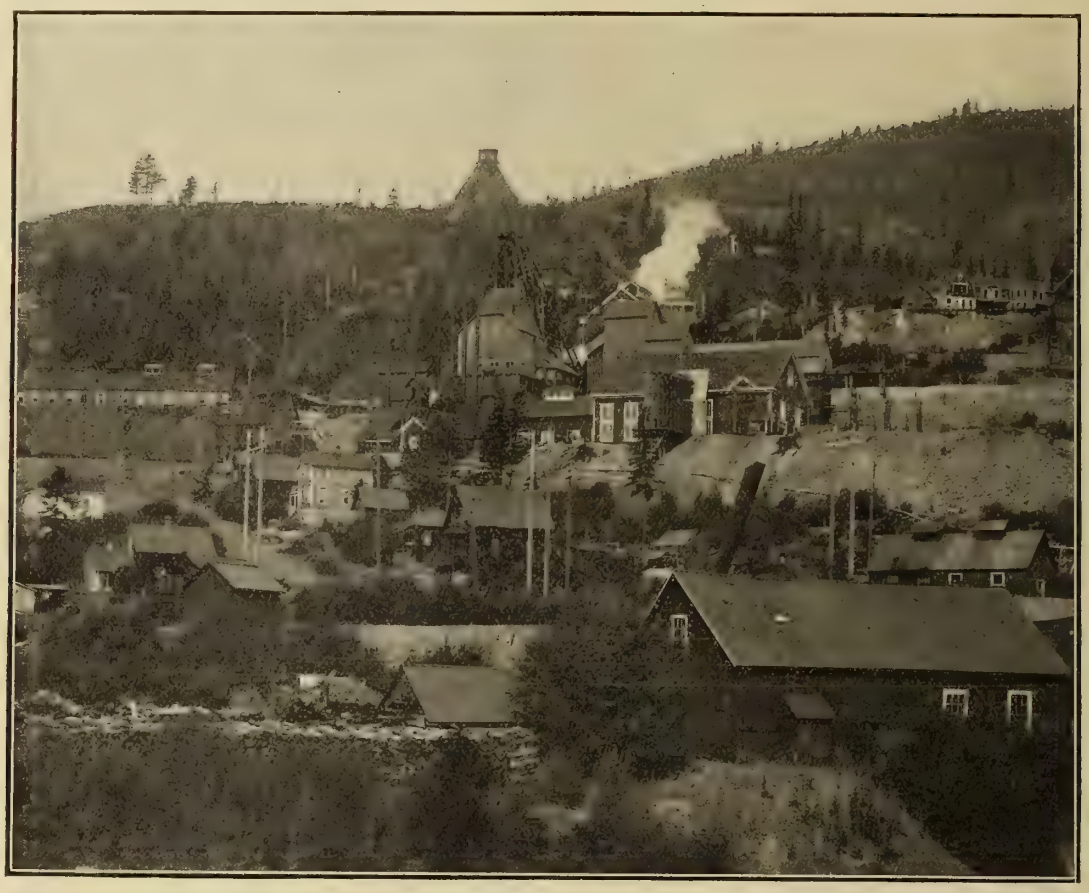
(Written for The Canadian Mining Journal.)

Below are given statistics showing the tonnage of ore received at Trail, B.C., of the Consolidated Mining & Smelting Company of Canada, Limited, together with the quantities and value of the several metals produced therefrom during the company's fiscal year ended June 30th, 1910. For purposes of comparison, corresponding figures for the fiscal year to June 30th, 1909, are also shown.

The extensive mining and smelting operations of the Consolidated Company make it an important factor in the mining industry of British Columbia. That this is so in marked degree, is evident when it is remembered that the value of the metals produced by the company during its last fiscal year is within $200,000 of one-fourth of the total value of all minerals produced in the province during the last calendar year. That is to say, this company alone produced in twelve months, approximately twenty-five per cent. of a total value equivalent to that of the production of all mines, quarries, brickfields, cement works, etc., that contributed to the mineral production of British Columbia in 1909, as set forth in the Annual Report of the Minister of Mines for that year.

The Consolidated Mining & Smelting Company's operations are varied as well as extensive. Its gold-copper mines at Rossland are now the mainstay of that town; its big lead mine in East Kootenay, with accessory concentrating mill, has long occupied a similar position in relation to the town of Moyie; its Richmond-Eureka silver-lead mine during the two years last past has had the largest payroll in the immediate vicinity of Sandon, Slocan; in the Boundary district its Snowshoe copper-gold mine has contributed to the business and prosperity of Phoenix, though in much smaller degree than the neighbouring big mines of the Granby Company; while in the southern part of the same district its construction work in connection with the re-opening of the No. 7 gold-silver mine has transformed a locality in which mining activity had ceased several years ago. Similarly, its operations at the Sullivan lead mine, during the last six months have brought new life to the neighbourhood of Marysville, East Kootenay, and at the Queen Victoria copper mine, to the camp near Beasley Siding, in Nelson mining division.

The part this company has taken and continues to take in sustaining the Town of Trail is, perhaps, more manifest, since that is the centre of its important activities. Its influence on numerous other parts of the Kootenay and Boundary districts than those above-mentioned, is not nearly so plainly evident, but were the big works at Trail to be closed, stagnation would speedily result in most of the producing mining camps of the extensive area from which its supplies of ore are drawn.



CONSOLIDATED MINING AND SMELTING COMPANY'S SMELTER, TRAIL, B.C.

To all familiar with the list of shipping mines published weekly by the provincial press, it is well known that while the Boundary smelteries receive a much larger tonnage of ore from a few mines, it is the Trail works chiefly, that, under existing conditions, makes it practicable to produce ore in many parts of the Kootenay. Were the position looked into more closely it would be seen, too, that even distant cities are benefitted by the operations of the Consolidated Company, for lead from its electrolytic lead refinery—the first of its kind to be established anywhere—supplies works for corroding lead and manufacturing other lead products in Montreal in the east, and in Vancouver in the west.

The close of this company's fiscal year is therefore a time of more than ordinary interest to those concerned in the progress of mining in British Columbia, though, thanks to the commendable policy of publicity adopted some time ago and now well established, it is always

Ore Receipts During Fiscal Year.

From Company's mines—	Tons.	Tons.

CENTRE STAR.

practicable to ascertain results as to tonnage of ore received and smelted week by week, while quantities of metals produced are generally made known monthly.

The financial statement for the year under notice is not yet available, but since that is of less importance to those who are not stockholders in the company than is information relative to mining and smelting operations, the customary delay of about three months before that shall be made public, will be taken as a matter of course. From the industrial point of view the interesting features of operations are disclosed in the appended statistical tables and other information. The headings of the several tables will serve to indicate the particular nature of the information they respectively contain:

Production During Fiscal Year.

Metals.	Quantities.	Value.
Gold	137,614 oz.	$2,814,676
Silver	2,162,406 oz.	1,134,881
Lead	42,365,816 lb.	1,182,980
Copper	5,974,959 lb.	779,230
Total gross value		$5,911,767

The tonnage of ore smelted was as follows: In copper furnaces, 430,851 tons; in lead furnaces, 56,274 tons. Shipments of gold-copper matte and lead bullion, respectively, were: Matte, 7,072 tons; lead bullion (to Trail refinery), 22,117 tons.

Refinery Production.

Production at the Trail refinery was as under:

	Quantity.	Value.
Lead	21,184 tons.	$1,182,980
Fine Gold	14,017 oz.	289,241
Fine Silver	1,991,357 oz.	1,045,957
Total value		$2,518,178

(Note.—This value is included in total production given above.)

The proportions of value of the several metals included in the total production during the fiscal year are as follows:

Value of gold	47.6 per cent.
Value of silver	19.2 per cent.
Value of lead	20.0 per cent.
Value of copper	13.2 per cent.
	100 per cent.

During the year just closed the tonnage of ore received was 485,457 tons, as compared with 347,417 tons smelted during the fiscal year immediately preceding. Ore receipts from the company's mines were appreciably larger, having been 406,684 tons last year, as against 319,865 the year before. Of the increase, 11,000 tons was from the Centre Star group, and 73,000 tons from the Snowshoe. The St. Eugene did not ship to the smeltery as much as in the previous year, but the Richmond-Eureka tonnage was larger, while the Sullivan and Queen Victoria were new acquisitions by the company. It should be added that the figures in the first table relating to the St. Eugene show concentrates shipped, not the tonnage of ore mined, which was probably about 140,000 tons.

Totals to June 30th, 1910.

The figures given in the following table show the respective totals of ore received, metals produced, and gross value, for all years from 1894 to June 30th, 1910, inclusive, excepting only metal contents of ore on hand at the close of this period, and the value of same. They are as under:

Tons of ore received	2,457,016
Gold produced (ounces)	952,056
Silver produced (ounces)	16,999,873
Lead (lbs.)	220,869,555
Copper (lbs.)	43,453,814
Gross value of metals produced	$42,646,025

It is noteworthy that the total value of the production of all the lode mines of the province during the 16-year period, 1894-1909, was $163,598,343, so that the value of the production of the Trail smeltery for the same period was nearly 25 per cent. of that of the lode minerals of the whole of British Columbia.

ST. EUGENE.

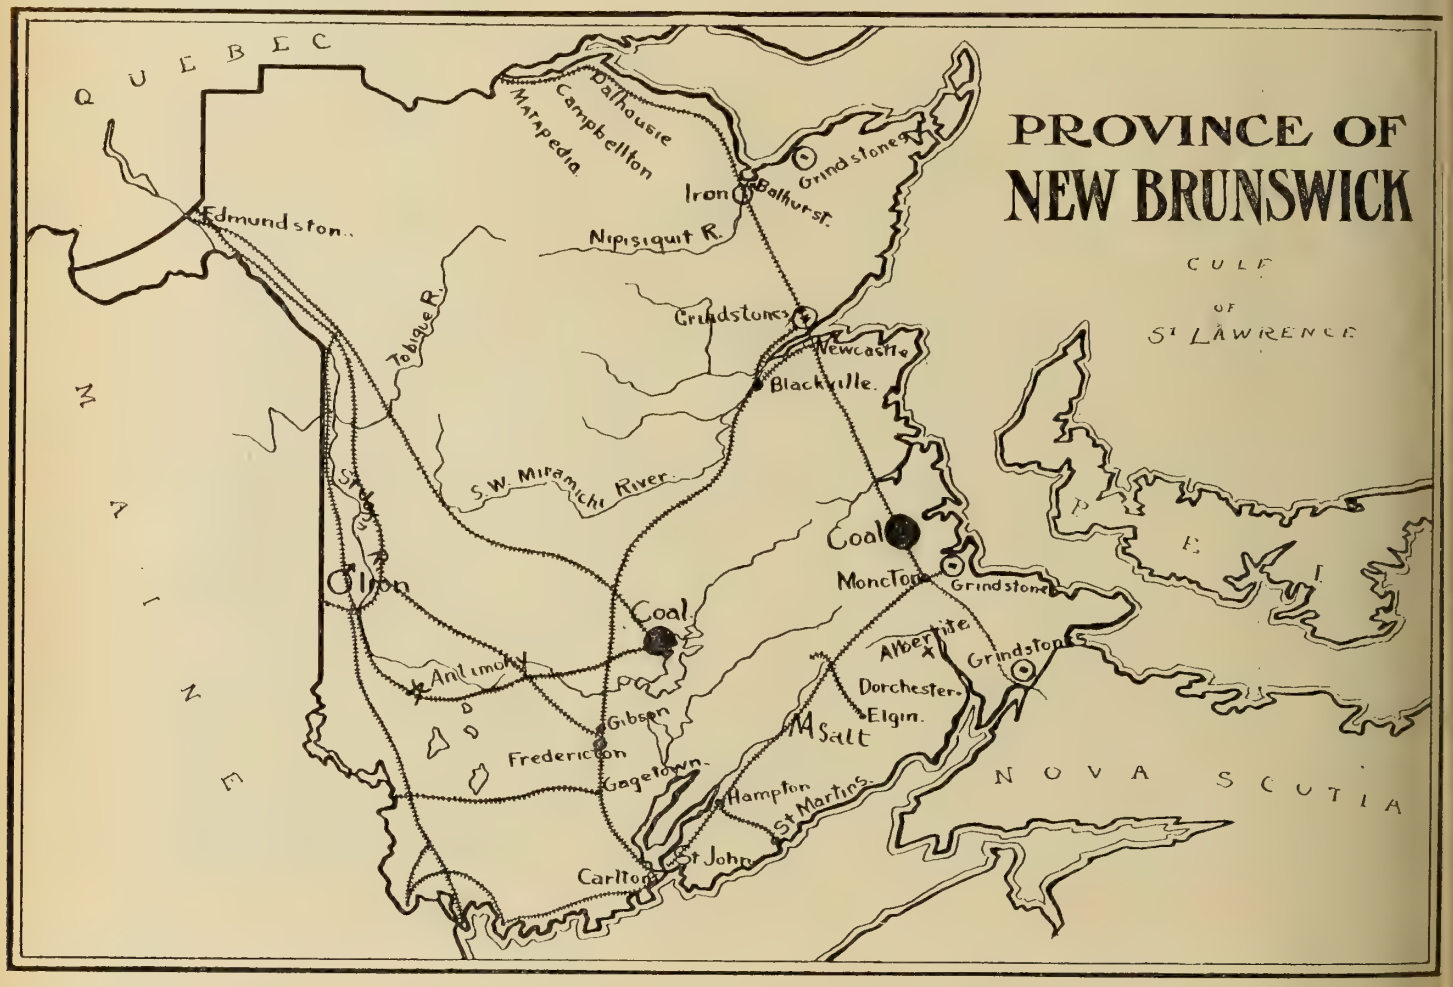
Comparative Tables.

A comparison of production for the fiscal years ending June 30th, 1909, and June 30th, 1910, respectively, shows as under:

Quantities—	To June 30th, 1909.	To June 30th, 1910.
Gold	114,920 oz.	137,614 oz.
Silver	2,443,475 oz.	2,162,406 oz.
Lead	43,675,077 lb.	42,365,816 lb.
Copper	4,637,631 lb.	5,974,959 lb.

Value for Year.

To June 30th, 1910	$5,911,767
To June 30th, 1909	5,505,526
Increase	$ 406,241



BATHURST DISTRICT, NEW BRUNSWICK.

By G. A. Young.

(Abstract from the Summary Report of the Geological Survey.)

General Character of District.

The district lies along the northeastern edge of the rugged country of central and northwestern New Brunswick, where this relatively elevated region is bordered by the comparatively low, almost flat, Carboniferous area of the eastern part of the province. Within the limits of the sheet, the north-flowing Nipisiguit River approximately marks the boundary between these two contrasting types of country. On the east, the nearly level, slightly rolling country, underlain by practically horizontal Carboniferous strata, gradually rises from the sea to a height of about 270 feet. West of Nipisiguit River, over the area occupied by highly folded and faulted pre-

Carboniferous strata and invading igneous bodies, the land rises more rapidly to a maximum height of slightly over 700 feet above the sea.

West of the Nipisiguit, the contours pursue generally, north and south courses, but swing far up the often gorge-like valleys of the easterly-flowing streams and rivers tributary to the Nipisiguit. In a number of instances these ravine-like waterways are particularly striking, as in the case of that of the Tetagauche River, the waters of which are confined to a narrow, trench-like depression seldom more than 20 feet wide, with steep, often almost vertical walls rising 75 to 200 feet above the river bed. But, except in the immediate neighbourhood of the larger waterways, the country is broadly rolling, with only an occasional outstanding hill. Save for the stream valleys, the surface of the country is a tilted plain rising from the Nipisiguit Valley, with a fairly even westerly gradient.

General Geology.

The two contrasting types of country east and west of the Nipisiguit are, geologically also, sharply differentiated. East of the Nipisiguit the country is underlain by almost undisturbed, reddish, fine conglomerates, sandstones, and shales of Carboniferous (Millstone Grit?) age. West of the river, the rocks are largely early Palæozoic (Ordovician?) sediments, chiefly black slates and grey sandstones and slates, closely folded and faulted, and in places, schistose. They are penetrated by dike-like bodies of igneous rocks, and to the south and west of Bathurst by a large body of granite that disappears eastward beneath the younger Carboniferous strata.

The country, as a whole, is very unfavourable to the study of geology. Save along the beds of a few of the larger streams, exposures are usually wanting. Over square miles of country no rock *in situ* appears, the underlying formations being largely hidden by morainic

and other material of glacial origin. Because of this general lack of exposures and the highly folded attitudes of the beds west of the Nipisiguit, it is not possible to offer an entirely satisfactory classification of the sedimentary rocks or to determine with certainty their ages. The following tabular list of formations is, therefore, but an imperfect one:

QUATERNARY.

Stratified clay, sand and gravel.
Glacial till, morainic deposits, etc.

PALAEOZOIC.

Carboniferous—
Bathurst formation.
Devonian?—
Bonaventure formation.
Nipisiguit granite.
Post-Ordovician—
Basic dikes.
Austin Brook quartz porphyry.
Ordovician—
Black Shales, sandstones, etc.

Ordovician, Black Shales, Sandstones, etc.—Along nearly the whole course of the Tetagauche River, and at intervals in the beds of Little and Middle Rivers, are numerous exposures of tilted and faulted, black, often highly graphitic slates, in many places accompanied by broken or torn bands of fine, dark sandstone. With the dark beds, also occur one or more zones of brick red, hardened, argillaceous or fine, arenaceous, slaty beds. Though rarely seen in the intervals between the main streams, these dark slates, etc., doubtless occupy nearly the whole of the country east of the Nipisiguit, excepting the portion underlain by the batholithic area of Nipisiguit granite. To the south, beyond the limits of the map-sheet and south of the granite body, the dark slates and associated beds reappear along the Nipisiguit, and are there intruded by the Austin Brook quartz porphyry, with which are associated the Nipisiguit iron deposits.

In places, the slates are schistose, apparently both along zones of shearing, etc., and in the neighbourhood of the granite batholith. The strata are closely folded, the strike, in general, being east and west, and the dip often nearly vertical. Quartz veins are common, and are very numerous in narrow zones. At many places, the rocks are impregnated with pyrite, often to a high degree.

Fossils were found in these beds at only one locality, on the Tetagauche, near the crossing of the Intercolonial Railway, where imperfectly preserved graptolites occur. A collection of these graptolites made by an earlier observer, was examined by H. M. Ami, who stated that the enclosing shales "appear to be . . . homotaxial with the shales of Norman Kiln, near Albany, N.Y. . . . ;* that is, with the lower Trenton."

On the several rivers already enumerated, appear comparatively narrow zones of fine tufaceous conglomerates, sandstones, and shales, all grey in colour, and closely enfolded with the dark slates. It is possible that these grey measures lie along synclinal axes of folding, since they closely resemble grey beds more widely exposed to the north, in the district examined in 1908, where they appear to underlie fossiliferous Silurian measures.

Post-Ordovician, Austin Brook Quartz Porphyry.—The Ordovician slates, sandstones, etc., occur for a number of miles along the shores of Nipisiguit River, south of the southern boundary of the granite batholith. About half a mile below the Great Falls of the Nipisiguit, at a point some seven miles south of the boundary of the area of the main map-sheet, the sediments are followed by quartz-porphyry and associated rocks, that extend along the river for over a mile to the mouth of Austin Brook and for an unknown distance beyond. The area of quartz-porphyry is important, since within it occur the iron deposits.

Normally, the quartz porphyry is a dark rock full of transparent, glassy grains of quartz often small in size, and usually accompanied by white crystals of feldspar lying in a dense matrix. At times the phenocrysts are large, and in some cases, those of feldspar are fully half an inch in length. Almost invariably, the rock has a schistose parting, and in certain zones or areas it has been changed to chloritic and sericitic schists.

The contact of the quartz porphyry and the sedimentary series was seen at one locality, where it appeared conformable to the bedding planes of the clastics. The quartz porphyry appeared to be intrusive, and, possibly, the intrusion took the form of an immense sill. The porphyry seems to have been involved in the main folding in the region, and in age, therefore, is probably pre-Devonian.

Post-Ordovician, Basic Dikes.—North of Tetagauche River, and to a less extent to the south, are exposures of dark, basic rocks called diabase in the field. They apparently belong to a series of dikes, some of which appear to be of considerable magnitude. Somewhat similar forms cut the Austin Brook quartz porphyry, but were nowhere observed cutting the Nipisiguit granite.

Devonian, Nipisiguit Granite.—Exposures of granite occur on the lower reaches of Little and Middle Rivers and on the Nipisiguit River from above Rough Waters to a point about five miles above Pabineau Falls, or over a distance, in all, of about eight miles. Though scarcely a single exposure of granite was found in the areas between the waterways, it is fairly evident that all the observed exposures belong to the western part of a single batholith whose major axis runs north and south with a length of about eleven miles. The eastern part of the granite body is covered by the younger, overlying Carboniferous sediments lying east of the Nipisiguit.

Typically, the granite is a grey, biotite granite, with a slightly pinkish tinge, due to the presence of numerous large crystals of feldspar. The larger feldspars lie in a fine, grey matrix of feldspar, quartz, and abundant biotite. Other varieties of granite are less abundantly present. Pink aplite dikes are common.

The granite undoubtedly penetrates the Ordovician slates and associated sediments, sending dikes into them and altering them in the neighbourhood of the contact. Along the course of the Nipisiguit, numerous exposures show the granite passing under the red, Carboniferous beds of the Bathurst formation, of which the lowest beds —for a few inches or more—are usually of the nature of a fine arkose, composed of material derived from the breaking down, apparently *in situ*, of the granite. At a number of points the contour of the plane of contact between granite and sediment is visible, and where this is so the old rotted surface of the granite may be seen to have rounded, mammillary outlines, while the rock itself presents parting planes concentric with the outline of its surface.

The Bathurst granite appears to have been intruded at a period intermediate between the folding that, farther north, involved Silurian measures, and the deposi-

* H. M. Ami, Summary Report for 1904, Geological Survey, Canada, pp. 289-290.

tion of the beds of the Bonaventure formation of late Devonian or early Carboniferous age. Therefore, the granite is regarded as being of Devonian age.

Devonian, Bonaventure Formation.—Within the area covered in 1909, only one exposure of the Bonaventure formation was seen. In the previous year, the formation was met with at intervals along the sea coast. The beds are usually dark red in colour, flecked with white from carbonate: they consist of coarse conglomerates, coarse and fine sandstones, shales, and less often, dolomitic beds.

These beds, as exposed along the shores of Nipisiguit Bay and westward along Chaleur Bay, have been correlated by a number of observers with the Bonaventure beds as exposed on the island of that name lying off the extremity of Gaspe Peninsula, Quebec. The Bonaventure formation has usually been classed with the early Carboniferous, but in recent years doubt has been expressed as to the propriety of so doing, and the opinion advanced that they should rather be regarded as of Devonian age.** In the previous Summary Report of 1908, the Bonaventure beds were assigned to the Carboniferous, on the supposition previously expressed, or implied by various geologists, that these beds conformably underlaid the Millstone Grit east of Nipisiguit River. This year's examination of the area, however, failed to confirm the supposed equivalency of the beds underlying the Millstone Grit and those of the Bonaventure formation lying along the coast, and, therefore, following Clarke, they are now considered to be late Devonian rather than early Carboniferous.

Carboniferous, Bathurst Formation.—The beds of the Bathurst formation are recoloured, fine conglomerates, sandstones, and shales, and are exposed at intervals along the banks of the Nipisiguit River almost from its mouth to a point several miles above Pabineau Falls. Sandstones and shales are the common varieties; conglomerates are comparatively rare. The measures lie almost horizontally, with only a very slight eastward dip. Cross bedding is common. The formation overlies the Nipisiguit granite, and a number of contacts are exposed on the Nipisiguit. Nowhere was a true basal conglomerate seen, the basal bed usually being an arkose several inches, to a foot or so, thick. The curious mammillary outlines of the planes of contact between granite and sediment, as well as the regular concentric parting planes in the plutonic rock, have already been mentioned.

The absence of basal conglomerates, the presence of an arkose apparently derived from the granite directly below, the mamillary outline of the contact plane and the concentric partings in the granite, so like exfoliation planes, all suggest an æolian origin for at least a part of the Bathurst formation. The presence of fine shales and the occasional beds of conglomerate seem to negative this supposition. As the district in question seems to lie about on the last shore-line of the advancing sea of Carboniferous time, possibly æolian and aqueous deposits may have irregularly alternated with one another prior to the more permanent submergence during the time of the formation of the Millstone Grit, beds of which outcrop not far to the east, and apparently conformably succeed the Bathurst beds.

Quaternary.—Stratified gravels, sands and clays, accompanied by distinct terraces, occur along the lower slopes up to heights of 250 feet to 300 feet. Boulder clay occurs, and in one section was observed to hold interstratified, cross-bedded layers of sand. Over considerable areas the country is completely mantled with boulders, often of large size. Certain hills are apparently composed of tumultuous aggregates of boulders of all sizes that seemingly have been glacially transported. Imperfectly preserved glacial striæ were observed at a few points within the area examined in 1908, but none were recorded during 1909. The transported material, so widely distributed over the whole country, is of rocks such as underlie the district or are believed to occur farther inland. The imperfect evidence collected apparently indicates that, at least in the last recorded stages of glacial times, the movement of the ice sheet was northward and outward from the interior of the province.

Economic Geology.

The main interest of the district, as far as economic geology is concerned, centres about the iron ore deposits of the Nipisiguit River. Within the area examined this year, manganese deposits also occur, on Tetagauche River near the falls above the last road bridge. The Nipisiguit granite has been quarried to a small extent, the stone having been used for bridge piers on the Intercolonial Railway, also for certain buildings in Bathurst, etc.

Iron.

The Nipisiguit iron deposits are found on both sides of Austin Brook where it empties into the Nipisiguit River at a point about sixteen miles south-southwest of Bathurst. The deposits are the property of the Canada Iron Corporation. This company is, at present, completing a railway running from the site of the ore bodies, along the west side of the Nipisiguit to a point of junction with the Intercolonial Railway, not far from where this railway crosses the river. When completed, the new line will have a length of about sixteen miles.

Up to the end of September—with the exception of the sinking of eight diamond drill holes, and a very slight amount of stripping—little development work had been done in connection with the ore bodies, the energy of the company being chiefly directed toward the completion of the branch railway.

Austin Brook, where it joins the Nipisiguit, flows about south-southeast, in a narrow valley with steep sides rising 60 feet to 80 feet above the floor. East of the brook, the country is comparatively level; west of the stream, the land rises in a broken ridge bounded on the west by a depression somewhat analogous in size and course to that occupied by Austin Brook. One ore body lies west of Austin Brook, running in a southerly direction between that stream and the Nipisiguit; the remaining ore bodies, in two groups, lie east of Austin Brook.

Nearly the whole of the surrounding country is heavily wooded, rock exposures are comparatively rare, and, altogether, there are only ten exposures or groups of exposures showing ore. The conditions, therefore, are very unfavourable to the study of the nature and forms of the deposits. The following statements are, in a measure, provisional only, pending a more detailed study of the evidence collected.

The ore bodies lie within the area of the Austin Brook quartz porphyry already described, and near a considerable body or a number of dikes of the so-called diabase. They have sharply defined walls, are largely of magnetite, and apparently have the forms of steeply-dipping, flattened lenses, the major axes of the outcrops trending nearly north and south. The character of the ore is indicated by the following figures derived from the results

** Clarke, J. M., New York State Museum, Memoir 9, pp. 92-96, 1908.

of nearly 70 analyses of samples taken at intervals of 10 feet from the cores of four diamond drill holes. The logs of the drill holes and accompanying analyses were very kindly placed at the disposal of the writer by Mr. Fulton, the local manager of the mining company:

Iron, average, between 47.0 per cent. and 51.0 per cent.; range, 39.6 per cent. to 58.7 per cent.

Sulphur, average, between 0.17 per cent. and 0.27 per cent.; range, 0.009 per cent. to 2.433 per cent.

Phosphorus, average, between 0.77 per cent. and 0.89 per cent.; range, 0.385 per cent. and 1.222 per cent.

The ore consists largely of magnetite, with sometimes a considerable proportion of hematite. Fine quartz, and probably various silicates, occur through it, giving the ore a finely-banded appearance. Quartz in small and large, often crenulated veins, is common; the mineral also forms comparatively large lenticular-like aggregates. Pyrite is somewhat abundant along narrow zones, and in some instances is very abundant in the foot-wall. At times the nearly pure sulphide forms lenticular aggregates nearly a foot in diameter. Within the ore body were observed narrow, discontinuous bands of nearly pure, fine silicates, perhaps representing altered country rock. In common with the country rock, the ore exhibits a prominent parting, or schistosity, striking about north and south or parallel to the direction of the main axis of outcrop. In the ore itself, this is accompanied by an apparent banding simulating bedding; the zones of quartz veins, of sulphide, and of intermixed or interbanded gangue, all follow the same direction, and all, at least roughly, dip parallel with the walls of the body.

Because of the lack of a sufficient number of natural or artificial exposures, an estimate of the size and general attitude of the ore bodies must largely depend on the evidence furnished by the diamond drill holes, and on the magnetometric survey of E. Lindeman of the Mines Branch. The outcrops are too few and too scattered to yield definite results.

According to the plan of the magnetometric survey, confirmed by the distribution of the natural exposures, the ore bodies lie in three main groups, the longer axes of which, at the surface, run, roughly speaking, north and south.

The body lying west of Austin Brook, and known as No. 1 deposit, is, at its northern end, exposed over its full width. At this point the outcrop had a width of about 150 feet, with sharply defined walls dipping westerly at an angle of about 45 degrees, giving a true thickness to the body of about 105 feet. A vertical drill hole sunk in the hanging-wall near this point, entered ore at a depth of about 40 feet and indicated a true thickness of about 90 feet. A second vertical drill hole bored at a point about 700 feet farther south, intersected ore at a depth of 50 feet, and yielded a calculated thickness of nearly 80 feet. A third drill hole, started at a place about 500 feet west of the last, and inclined toward the east at an angle of 20 degrees, cut ore at an equivalent vertical depth of 410 feet—where the ore body appeared to be about 65 feet thick. The results of the magnetometric survey indicate that the ore body extends at least 1,000 feet farther south, or, over a distance in all, of about 2,000 feet. As far as present knowledge goes, the walls apparently preserve a nearly uniform southerly strike and westerly dip, the angle of dip, in the northern half, being about 45 degrees.

A second body or group of ore bodies, known as No. 2, lies east of Austin Brook, the southern end commencing on the valley slope at a point about 1,000 feet east of the apparent end of No. 1. The course of the axis of the second body diverges about 23 degrees from that of the first. At the southern end a group of outcrops has a maximum width of a little over 40 feet, with nearly vertical walls. The southern extremity is well exposed, and the body is seen to end in a number of irregular fingers projecting into schistose country rock. Northward, ore outcrops at a few points for a distance of about 1,200 feet, and the indications are that the body remains at about a constant width, forming a comparatively narrow band. The magnetometric survey points to a horizon of practically the same length, but containing two ore bodies following one another along the strike.

A third ore body or group of ore bodies, known as No. 3, lies east of Austin Brook, and about in line with the prolongation of the axis of No. 1: commencing at a point about 1,800 feet north of it. Four diamond drill holes have been placed in this body, but the results of one only are at present available. The log of this drill hole, together with the position of surrounding exposures, indicates a body of ore about 100 feet thick, dipping west at an angle of about 75 degrees. In this instance, the drill passed through ore from a point about 20 feet below the surface to one 350 feet beneath it. Exposures of ore occur at the surface over a length of only 300 feet, but the magnetometric survey of E. Lindeman, supplemented by one carried out by Mr. Fulton of the Canada Iron Corporation, indicates an ore-bearing horizon of much greater length: perhaps totalling in the neighbourhood of two-thirds of a mile. It is possible that over this distance the ore may occur in more than one distinct body, and the magnetometric surveys also seem to indicate the existence—along a parallel line a few hundred feet west—of other bodies.

Besides the above main bodies, an outcrop of iron ore was seen in one of the cuttings on the line of the new railway not far above the falls on the Nipisiguit. The presence of other bodies of ore in the district is to be expected, but their discovery is practically possible only by making use of magnetometric methods.

All the information available seems to indicate that, the deposits have the form of beds varying in width from a maximum of 105 feet to a minimum of about 40 feet. In all cases the walls are sharply defined, and dip westerly at angles ranging from 45 to nearly 90 degrees. The three groups of ore bodies do not seem to represent one original one separated into three by faults, since, in the case of No. 2 body, what appears to be an original, natural end, is exposed.

The country rock of the three deposits is believed to be, in the main, quartz porphyry, or as is more commonly the case, a schistose derivative. In that rock the planes of schistosity in country rock and ore are, on the whole, parallel to one another, and to the bounding planes of the ore bodies and lines of banding in the ore. The ore bodies seem to have suffered from the forces producing the schistosity of the country rock, and, at the same time, to have been guided in assuming their positions by the greater degree of schistosity of the country rock along certain zones. The visible end of No. 2 body seems to indicate that the ore penetrates the country rock—not that the country rock was later than, and penetrated the ore.

The invariable presence of a rather high amount of phosphorus in the analyses indicates a considerable amount of apatite, a mineral whose presence in bulk usually indicates a direct or indirect igneous origin, and not a sedimentary origin nor one analogous to that of the more common types of veins. The very general presence of quartz veins in the ore and their absence or comparative uncommonness elsewhere, strengthens the above

deduction, and weakens the argument for a sedimentary origin of these bodies, which their bedded-like forms at first view suggest.

The present conclusion is, that the ore bodies are of pegmatitic types, and that their formation has been due to the action of forces accompanying or following igneous invasion or invasions the results of which are not otherwise apparent; they do not seem to have been directly associated in origin with the quartz porphyry. If this view of the origin of the ore bodies is the correct one, it seems highly probable that their true shapes are those of very flattened lenses; that the depths to which the individual lenses extend will prove to be, on the whole, not much greater than their maximum extension at the surface; and that the lenses will, as they approach their limits, thin out and end—as far as mining is concerned—rather rapidly.

(In the above considerations, the presence of the pyrite has been only briefly touched upon, since study has not sufficiently far advanced to determine, with any degree of certainty, the relative age of this mineral.)

Manganese.

A quartz vein carrying manganite, cuts red slates on the south bank of the Tetagauche above the last road bridge, and only a short distance below the falls on the river. The deposit was worked a number of years ago, but the tunnel leading in on the vein is now caved in, thus preventing any detailed examination. At its outcrop on the steep river bank, the vein is seen, in places, to be at least 13 feet wide, to be nearly vertical, and to be accompanied by roughly parallel, narrow veins. The quartz is coarse, and white in colour; it forms most of the vein, the manganite occurring in narrow seams and small patches or aggregates of plates, or in semi-detached, imperfect crystals or fine grains. The vein is irregular in outline, holds inclusions of country rock, and is much fractured. From information gained from nearby residents, it is believed that during mining operations solid or nearly solid ore was found to occur in pockets. Manganite, in small quantities, also occurs in the dump of several shallow trenches sunk a short distance back from the river, at a point several hundred yards farther down stream.

LOSSES BY FIRE AT BRITISH COLUMBIA MINES.

There was much destruction by fire of surface works at British Columbia mines during the month of July. The first accounts published in district papers and sent out in press despatches made it appear that leases had been large, but later accounts are to the effect that the position is not nearly so serious as was at first stated. However, there has been sufficient damage done to surface works of several producing mines to interfere with the output of ore to some extent, though, fortunately, the instances in which production must be suspended for a time are not numerous.

In the Slocan.

Parts of Slocan and Ainsworth mining divisions situated along the line of the two railways from Kootenay and Slocan Lakes, respectively, to Sandon appear to have been most damaged by fire. According to local accounts, the fire started along the Canadian Pacific branch railway, near Alamo, which is four or five miles on the Slocan Lake side of Sandon. Sweeping up the valley of the middle fork of Carpenter Creek, it reached McGuigan and spread thence over the divide to Bear Lake and on to Whitewater. The chief destruction reported occurred at the following named properties: The Idaho-Alamo, Queen Bess, Payne, Rambler-Cariboo, Lucky Jim, and Whitewater mines. Of the first three, the Idaho-Alamo is stated to have been the only one at which work has been done lately, and it was not on an important scale there. Unfortunately the situation in regard to the other three is quite different, for it had been confidently expected that each of these mines would make a comparatively large output during the second half of the current year; further, the position is much worse in this connection, for the reason that the Kaslo & Slocan Railway was also damaged to a considerable extent, having been rendered quite unfit for use for the six or seven miles of its length over which trains have been running to serve the three mines above mentioned as being detrimentally affected by the big fire.

As to the Kaslo & Slocan Railway—two or there years ago several big trestles along this line between McGuigan and Sandon were so much damaged, chiefly by snowslides, that the Great Northern Railway Company, which owns the line, did not regard the local traffic as sufficient to warrant the large outlay that would have been necessary to put that portion of the railway in good condition, so that trains could be again run to Sandon from Kaslo. So it has been, that for some time McGuigan has been the terminus of the operated part of the line. Now it is uncertain whether the company will replace the bridge and trestles recently destroyed along the length between Sproule's, which is 14 miles from Kaslo, and McGuigan.

Whitewater, situated at the junction of the creek of that name with Kaslo Creek, has practically disappeared, there being scarcely a building left on the site of the small settlement. Included among those burned were two large buildings, for office and residence purposes, erected years ago by the Whitewater Deep Company. The destruction of these, though, is of much less importance than the loss of the concentrating mill, which was situated nearly a mile up the creek, in close proximity to the portals of several adits driven into the mountain in which are the Whitewater and Whitewater Deep mines. This mill was re-started early in June, following suspension of operations consequent on shortness of water at the close of winter and in the early spring. The extent of the stoppage of ore-production will be best shown by mention of the fact that the output of the Whitewater group of mines in 1909 was between 28,000 and 29,000 tons of ore, from which the products shipped were 320 tons of crude silver-lead ore, 3,250 tons of silver-lead concentrate, and 4,360 tons of zinc-silver concentrate. It is probable exploration work will be continued in the mines, but this will necessarily depend upon the decision of those chiefly interested as to rebuilding the mill. Both the Whitewater properties are under lease, the owners being British companies.

Two or three miles beyond Whitewater, on the Sandon side of Bear Lake, which is the headwater of Kaslo Creek, flowing east to Kootenay Lake, and the middle fork of Carpenter Creek, which flows west to Slocan Lake, the Lucky Jim mine is on a mountain rising directly above the railway. (It was here that there was deplorable loss of life, for five men were suffocated by the thick smoke which filled the mine workings to which they had gone when the fire came over the mountain to the tunnel portals.) Some information descriptive

of this mine was published in the CANADIAN MINING JOURNAL of July 1 (pp.396-8), so it is hardly necessary to repeat the particulars thus recently printed. Briefly, it may be said that the lowest adit, driven during last winter and spring, had opened both large ore bodies, and that construction of an aerial tramway, with upper terminal at the portal of that adit and lower terminal with shipping bins alongside the railway, had just been completed. As yet it is not known to the writer what damage was done here by fire, early reports having indicated that a clean sweep had been made of mine buildings and tramways (two), while later statements published are to the effect that only old buildings, which it had been decided to replace by new ones, were destroyed. Further, a commencement has been made to repair the old wagon road from Three Forks to Bear Lake and thus provide a means of getting in building materials pending the rebuilding of railway bridges and trestles so that ore may again be shipped. A comparatively large tonnage of zinc ore of unusually good quality is now available for shipment, and, too, the erection of a concentrating mill at Kaslo for treatment of second class ore was being prepared for, so the railway company will doubtless take this into consideration when deciding its plans relative to the future of its line.

The position at the Rambler-Cariboo mine is especially to be regretted, for the reason that the company owning this property had been engaged for six years in carrying out an extensive plan of underground development and only lately had a stage been reached at which a resumption of production on a profit-earning basis became practicable. A description of this mine was printed in the CANADIAN MINING JOURNAL of July 15 (pp. 431-2), and to this readers are referred. It is sufficient now to add that the most important development work yet done in the Slocan district is that so far advanced in the Rambler-Cariboo, at which most of the mine buildings—modern and comparatively new—were burned. It is decidedly unfortunate that now, when ore bodies have been rendered accessible and preparations made for shipment of ore on a considerable scale, disaster has overtaken the company, and immediate large loss, besides a delay in production that will probably extend over several months, has resulted. It is thought the compressor plant may be made serviceable again; if so it will be practicable to proceed with further development work, which the company has announced its intention of doing as soon as the necessary arrangements can be made. In this the directors are displaying characteristic enterprise, and it is hoped this will result in eventual success, which is well deserved, for their persistence and pluck in developing their mine is worthy of all commendation.

Besides the larger Slocan mines above mentioned, there are several at which operations were on a smaller scale that have been disadvantageously affected by the fire. It is likely, though, that whatever damage has been done to these will be repaired and their operation continued.

Fires in Other Parts.

From East Kootenay, Nelson, and Boundary districts reports were also received of more or less destruction as a result of forest fires. At the St. Eugene lead mine, near Moyie, East Kootenay, the upper terminal of the aerial tramway connecting the upper levels of the mine with the concentrating mill was reported to have been burned, and other damage done. This tramway has served for conveying ore to the mill from the 400 adit and above. Ore from below the 400 down to the 1,800, together with that from all levels opened from the shaft below the 1,800 adit, passes over an electric tramway which, so far as known, was not reached by the fire. It is probable, therefore, there will be little, if any, interruption to operations at the St. Eugene mill.

Part of the pole line for the transmission of electric current to the 15-stamp mill recently completed at the Jewel mine, Long Lake camp, Boundary district, is stated to have been destroyed. This will delay for a time the starting of the mill, but it is not expected that anything more than a brief delay will be the result.

It may be that there were other losses than those narrated in the foregoing statement, but no very serious ones have come to the notice of the writer. It is hoped that with the coming autumn, danger from fire will be less; meanwhile the Provincial Government fire rangers are exercising much vigilance, and district Government agents are empowered to employ all assistance required to meet whatever emergencies shall arise.

THE BRISTOL MINE, PONTIAC COUNTY, QUEBEC.

A joint report, written by Messrs. E. Lindeman, M.E., and G. C. Mackenzie, B.Sc., dealing respectively with the Bristol iron ore deposits and with the magnetic concentration of those ores, has been issued by the Mines Branch, Ottawa.

The Bristol iron mine is situated on the north half of lot 21, range 2, in the Township of Bristol, County of Pontiac, Quebec, about 5 miles northwest of Chats Falls. A standard gauge railway, now in a state of decay, connects the mine with the Ottawa-Waltham branch of the C. P. R.

Operations were first commenced in the winter of 1872-73. A compressor and hoisting plant were installed, and necessary buildings erected. In 1894 the mine was closed, and it is now filled with water.

Geologically the area presents a series of Keewatin schists and gneisses, associated with crystalline limestone and intruded by granites. The magnetite deposits occur in irregular beds and pockets, interstratified with hornblende, calcareous mica, and chlorite schists. The schists are overlaid by highly siliceous mica schists, which are followed by gneiss. The strike of these stratified rocks varies from N. 70 degrees W. to N. 42 degrees W., with a dip towards the north varying from 89 degrees to 35 degrees. The ore bodies are frequently cut by basic granites often showing a strong pegmatitic structure.

Ore.

The ore consists of magnetite, containing in places a considerable amount of hematite. Associated with the ore are hornblendic, micaceous, and chloritic materials, which are distributed through the ore as well as interbanded with it. In places a complete gradation is observable between the magnetite and the gangue. Frequent small patches of iron pyrites are disseminated through the ore.

As the mine could not be sampled, the five largest ore piles were dealt with, five one-hundred pound representation lots being taken.

The metallic iron ranged from 53.75 per cent. to 58.18 per cent.; sulphur from 1.48 per cent. to 2.92 per cent.; and phosphorus less than 0.01 per cent. The average results were: Iron, 55.84 per cent.; phosphorus, 0.005 per cent.; and sulphur, 2.02 per cent. The percentage of titanium is negligible.

The extent of the ore bodies could be determined only by means of magnetometric survey. The following conclusions were reached: The magnetite occurs in parallel

beds and lenticular shaped bodies along the stratification. The association of the magnetite and the gangue materials seems to be very intimate. Numerous intrusions of granite cut the ore bodies into irregular masses and render uncertain their extent in depth. Systematic development by means of diamond drilling will be necessary.

Mr. MacKenzie's report deals with the magnetic concentration of the Bristol ores. General samples running 53.5 per cent. and 51.8 per cent. respectively were treated. The former gave excellent results, the total loss of iron by the dry process being only 3.54 per cent. of that contained in the original crude. Ninety per cent. of the total sulphur was eliminated by the wet process, the loss in iron being hardly 2 per cent.

The second sample gave poorer results owing to the large proportion of hematite contained in the ore.

In the wet test the concentrates were brought up to an iron content of 67.42 per cent., whilst the tailings ran as low as 5.03 per cent. iron.

Mr. MacKenzie believes that the concentrates would be amenable either to briquetting or nodulizing.

OUR EUROPEAN LETTER.

All mining shares very depressed in London. England and the Continent badly hit by collapse of American bull movement and mining shares sold as a consequence. The Stewart discoveries. British capital already forthcoming. Pause in oil. Success of the International Mining Congress. Some of the topics discussed. Steady rise in Rand working costs. The colour line in Transvaal mines.

Exclusive correspondence to Canadian Mining Journal

London, July 20th, 1910.

The eternal mystery as to why market quotations fall when the outlook of the industry represented by the shares is healthy is once more illustrated by the condition of affairs in the mining share markets here. Theoretically and apart from technical market conditions the outlook for South African mining shares is very much as could be desired. Yet day by day prices sag until they are down to extremely low levels. The latest outburst of activity of any kind in this department was the boomlet in Rhodesian shares in March last, and it has to be owned that that boomlet went to an extent not altogether justified by intrinsic values. The reaction appears to have carried along with it all other South African mining descriptions, but the true cause of the general severe dullness must be sought further afield. It is to be noted that the greatest weakness synchronizes with the news that heavy losses had been incurred by big Continental operators owing to the slump in Americans. Paris and Berlin have been ardent supporters of the bull movement engineered from Wall Street and long lists of failures show how heavily the blow fell. As these same Continental speculators have also been heavily interested in South Africans that market has necessarily been sympathetically affected. The reaction in rubber has no doubt also helped to breed a spirit of reluctance to trade. It must not be overlooked, however, that although leading South African shares are 20 to 50 per cent. below their best figures of this year they are very much above the lowest points touched during the extreme depression of the early part of 1909.

A little passing excitement was produced in the minds of mining speculators here when the news of the Stewart gold discoveries in Canada was cabled across, and in a very few days a company was registered here to acquire one of the first four gold mining claims staked out by the discoverers. Of a total capitalization covering one million shares at 50 cents apiece 400,000 were issued for subscription. Fair success appears to have attended this flotation.

General dullness is also shown by the oil section, where the only promotion of any importance recently, has been that of the Coalinga British Oil Company, formed for the purpose of acquiring freehold oil producing lands in California. The share capital is one and a quarter million dollars. In taking stock of the first half of the current year, however, many signs of a new activity are presented. Petroleum prospecting appears to have gone on to an extent never before undertaken, although no great strikes of oil of a spectacular nature have been made. At the moment not much is being heard of Maikop and its oil, and although experts hold that the oil is there in great quantities, the field as a commercial proposition is not yet out of the experimental stage. Geographically Maikop is well placed. It is within fifty miles of the coast of the Black Sea and thus in a position to ship its products to the European and near Eastern markets without fear of competition. Successful wells have been drilled and the fertile nature of the oil sands proved. Storage centres and adequate transport facilities are now required. English promoters are asserted to have obtained the best situated plots on the field and have paid less for them than have people in Baku. It is believed that the development of Maikop with English capital, may mean the establishment of a very large petroleum refining industry in England.

Taking advantage of the activity in oil, Walter R. Skinner of Clement's Lane, London, has issued the "Oil Petroleum and Bitumen Manual" at thirty-six cents. This book gives particulars of three hundred oil companies dealt in here involving a nominal capital of nearly $300,000,000.

The International Mining Congress at Dusseldorf was a huge success and it closed with a decision that the next convention should be held in London in 1915. Altogether eighteen hundred delegates attended and a great number of interesting papers on mining and metallurgical topics were read. The coal dust problems received special attention, and reports from various countries were represented showing what has been done in reference to the cause and prevention of dust explosions. One noteworthy paper appeared to prove that the coal dust danger might be regarded as non-existent whereever there was hydraulic impregnation of the coal face and hydraulic blasting by the Meissner process. With regard to a danger which is quite as serious as fire damp and coal dust, namely, sudden outbursts of carbon dioxide, the only remedy was to prohibit the mining of coal with the pick and to substitute shot-firing.

Interesting details were given by various speakers with regard to recent developments in shaft-sinking. The petrification process, the freezing method and the acceleration of shaft sinking by the use of compressed air-locks were described.

A German paper dealt with face conveyors and it mentioned how in England the scraper type of conveyor had been raised to a high degree of perfection, with outputs increased, and important economies in working effected. Machine coal cutting methods obtained attention and an English bar machine and a German undercutting and nicking machine were favoured. A report on British tests of mining ropes brought out the curious fact that in Great Britain no such tests are required by the regulations. All the same, despite the increasing depths of mine shafts, there had been only 38 fatal accidents in ten years rising from the failure of winding ropes. Severe tests are made by the makers and the steel used when drawn into wire has a breaking strength of from 120 to 160 pounds per square inch.

The need for the unification of mining statistics was emphasized by one delegate and the Congress agreed by resolution that a committee should be appointed in order to get rid of the lack of uniformity in the conception and methods employed in different countries. On the application of electricity to mining and metallurgical requirements many delegates gave information and expressed their views, and special attention was devoted to pumping plants, ventilators and large winding engines. For main shaft winding, from the standpoint of safe working, first cost, and running charges, one German engineer considered the Leonard system the best that had as yet been devised. Figures were also quoted showing the degree of efficiency obtained by Ilgner installations.

Aerial ropeways of great capacity were described in another paper and it was mentioned that the Aumetz Kneuttingen ropeway, which had a length of about seven miles had carried over two and a half million tons of iron ore during the last four years, at a cost of 0.64 cents per ton per mile. With the four-roller double-bogie truck it would be possible under favourable conditions to bring the cost down to 0.38 cents per ton per mile.

General problems of haulage were also raised. Compressed air locomotives for mine railways, it was pointed out, were first employed on a large scale in North America and it was not until quite recently that European mine owners had realized the advantage of compressed air haulage. Immunity from fire and explosion combined with simplicity of manipulation and trustworthy operation were mentioned as leading attractions. A Saarbrucken expert on underground haulage showed that economically working electric overhead cable locomotives designed for single phase, and in some places three phase, current had successfully been applied to work below ground. Extensive use had also been made of motor locomotives driven by liquid fuel, but this expert admitted the desirability of compressed air locomotives in fiery mines.

A number of interesting papers were also read upon metallurgy and applied mechanics. A geological section was also opened where twenty papers were read dealing with a great variety of subjects. These included the mineral resources of Canada, the gold deposits of Abyssinia, the iron supplies of the world, the utilization of water power and the origin of coal.

Supplementing the official figures of the Rand's gold output for June, a private cablegram from Johannesburg gives me statistics relating to the yield per ton, working costs, and profit. This table enables comparison with the corresponding figures for the preceding months of the current year:

	Yield per ton.	Costs per ton.	Profit per ton.	Total profit.
	s. d.	s. d.	s. d.	
January . . .	27 7	17 0	10 7	$4,621,375
February . . .	28 5	17 6	10 10	4,373,730
March	27 6	17 1	10 4	4,568,795
April	28 1	17 6	10 7	4,636,220
May	28 3	17 6	10 9	4,791,735
June.	28 1	17 9	10 5	4,605,680

It will be seen that the June ratio of working costs was the highest of the year, but the profit ratio was not quite the lowest.

I learn from an entirely trustworthy source that the recent Commission on mining regulations has drafted some very important proposals applying to all mines in the Transvaal, which will be recommended to the Government. One suggestion is that only white men shall in future receive blasting certificates and that only competent white men shall be allowed to be in charge of boilers, engines, and machinery. The existing rules draw no colour line and a number of coloured men now hold certificates.

Stringent regulations are proposed to safeguard the health of the men underground. All dusty rock must be damped, and no person suffering from tuberculosis or disease of the respiratory organs shall be permitted to work underground. Some suggestions made with the idea of preventing accidents lay down the principle that no incompetent or inexperienced man shall be allowed to take part in dangerous work. The hours of work underground are limited to eight a day, exclusive of the time occupied in reaching work and returning to the surface . If adopted, these regulations will have a most important effect upon the mines of the Rand from the standpoint of the white miners.

RHODESIAN GOLD OUTPUT.

The total output of gold from Rhodesia for the month of June is cabled as 51,016 ounces, valued at £214,709, as against 53,419 ounces, valued at £224,888, in the previous month. This is a decrease on the month of £10,-179. There were 195 gold producers last month. The output of other minerals for last month was: Silver, 19,-318 ounces; lead, 67 tons; coal, 15,191 tons; copper, 3 tons; chrome ore, 5,901 tons; asbestos, 70 tons.

The following table shows the monthly gold returns in sterling since 1908:

Month.	1908.	1909.	1910.
	£	£	£
January	199,380	204,666	227,511
February	191,636	192,497	203,888
March	200,615	202,157	228,385
April	212,935	222,700	228,213
May	223,867	225,032	224,888
June	224,920	217,600	214,709

The annual consumption of coal in Canada is approximately 20,000,000 tons. Of this quantity the United States supplies slightly more than 50 per cent.

KOPPERS' BY-PRODUCT COKE OVENS AND DIRECT AMMONIA RECOVERY PROCESS.

A high stage in the advance of coke oven construction has been attained by the Koppers' by-product ovens. That the industry appreciates its merits is fully evidenced by the increasing number of ovens built of this type. In the short period of seven years since this oven was introduced, there has been erected and under construction, by the various branch offices of H. Koppers, located at Joliet, Ill.; Sheffield, England; Paris, France; Vienna, Austria; and Essen, Germany; a total of over 5,600 Koppers' ovens. The greater part of this business has been in Germany, where the oven was introduced, and where it has easily displaced all other types; and the oven has proven so successful that it has also found favour generally throughout Europe and America, as well as in Australia and China. In the United States, the United States Steel Corporation decided in 1907 to build a by-product coke oven plant in connection with its blast furnaces at Joliet, Ill. Accordingly a committee was sent to Europe to investigate the relative merits of the different by-product coke ovens in use in Germany. Upon their recommendation, a plant of 280 Koppers' by-product ovens was built in Joliet. The results of this installation were so satisfactory that this Corporation in 1909 began the erection of a plant of 560 Koppers' by-product ovens at its new steel plant at Gary, Ind., and has just begun work on a third plant of 280 Koppers' ovens at Birmingham, Alabama. In addition to these orders from the United States Steel Corporation, the American branch of H. Koppers' has built 86 ovens in Mexico, and has under construction 110 ovens at Sault Ste. Marie, Ontario, for the Lake Superior Iron & Steel Corporation, and 60 ovens for the Woodward Iron Company, at Woodward, Ala., making a total of 1,376 ovens in America in the short period of three years.

To make such rapid strides, this oven must possess some peculiar and noteworthy advantages. One primary advantage must necessarily be the high quality of coke produced. In addition to this distinctive advantage the construction of this oven is such that it excels in economy of fuel consumption, thus yielding a larger percentage of surplus gas. These are the essential points of superiority of the Koppers' by-product regenerator coke oven.

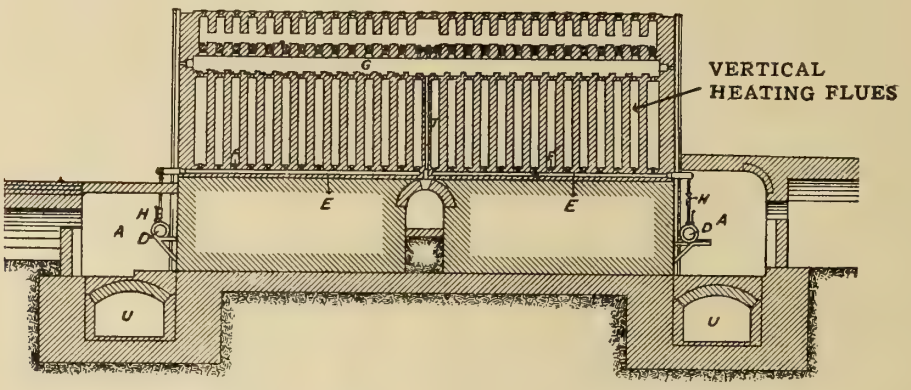

Fig. 1. Longitudinal Section of Koppers' Oven, showing Vertical Heating Flues.

Koppers' System of Heating Flues.

To make a good, homogeneous quality of coke, an oven must necessarily be uniformly heated; and the Koppers' oven design accomplishes this result to a nicety. The ovens are heated by the combustion of the gas in flues which are so arranged that the walls of the ovens are equally heated throughout their entire length. This is accomplished by a large number of gas burner nozzles, there being one burner for each vertical flue and thirty flues on each side of each oven. Therefore, each oven is heated by the combustion of the gas at sixty different points. Consequently the charge is subjected to exactly the same intensity of heat at all points, and the desired uniformity in the quality of the coke is secured. With so many burners, we might expect a complex design and

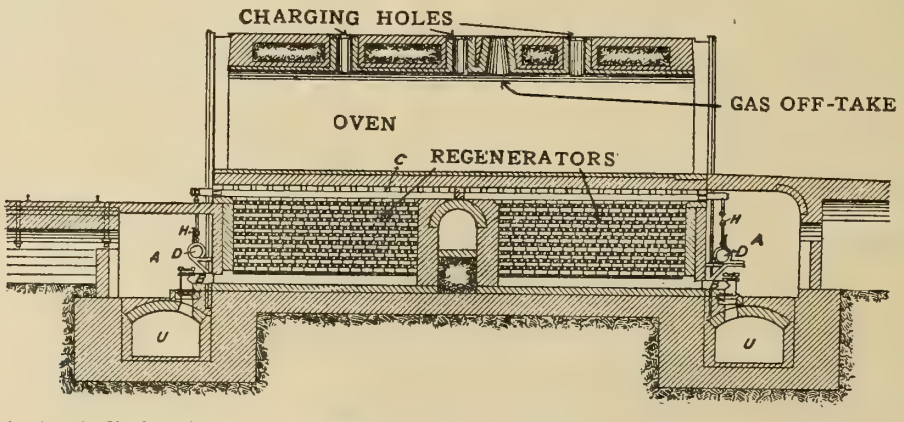

Fig. 2. Longitudinal Section of Koppers' Oven, showing Oven Chamber and Koppers' Patent Cross Regenerators.

difficulty in regulating the combustion at so many different points. But we find that the Koppers' oven is simple in design, and the combustion in the heating flues is most easily regulated. The burners are all readily accessible for inspection, or adjustment, by means of openings into the vertical heating flues, on top of the battery of ovens. An additional advantage gained by this uniform distribution of heat is the shortening of the coking time, thus increasing the efficiency of the ovens.

Fuel Economy.

In the by-product regenerator coke oven, the gases evolved from the coal are conducted to the condenser and saturator house, where the tar and ammonia are recovered. Some of the cleaned gas is then returned to heat the ovens. The balance of the gas, or surplus gas, is available for power purposes or for distribution to domestic consumers. It is in the percentage of surplus gas that the different types of ovens essentially differ from each other. The Koppers' oven, because of its improved system of heating flues and its efficient regenerator chambers, is remarkably low in its fuel consumption, and the yield of surplus gas is 50 to 60 per cent. of the total quantity evolved from the coal.

Koppers' Patent Cross Regenerator System.

In this type of oven, the Siemens regenerator system has been admirably adapted to coke oven construction. The usual form of regenerators consists of two long chambers running the whole length of the battery of ovens. In case of any repairs to the regenerators, this arrangement necessitates the whole battery of ovens being shut down. To obviate this disadvantage and also to enable the hot air to be still more satisfactorily distributed among the heating flues, the Koppers' new system of regenerators was introduced. In this system there is a separate pair of regenerators for each oven in the battery. During a period of 30 minutes air is admitted into the regenerator at one end of the oven and after being heated by contact with the hot checker brick in one-half of the regenerator, it enters the vertical heating flues, where it unites in combustion with the gas entering the flues throughout one-half of the oven length. The products of combustion pass up these heating flues and down the vertical flues throughout the other half of the oven length, then through the other half of the regenerator, and finally through a flue to the stack. In their passage through the regenerator the waste gases heat the checker brick, and after 30 minutes, the gas valves and air dampers are automatically reversed, and during the next 30 minute interval cold air and gas enter at the opposite end of the ovens, the brick in that half of the regenerator, and combustion takes place in the vertical flues, which during the previous period served for the passage of the waste gases to the regenerator. The principal advantages of the Koppers' cross regenerator over the long regenerator type is that it permits of a better regulation of the air supply of each oven, and this air is heated to a higher temperature, thus promoting fuel economy.

Strong Construction and Minimum Repairs.

The construction and working of the Koppers oven is exceedingly simple, and its design is such that it is stronger than any other system. The oven walls consist of a series of hollow columns reaching from the bottom to the top of the structure. Added to this, the uniformity and regularity of heating is conducive to a long life and a low repair account. With all of these points

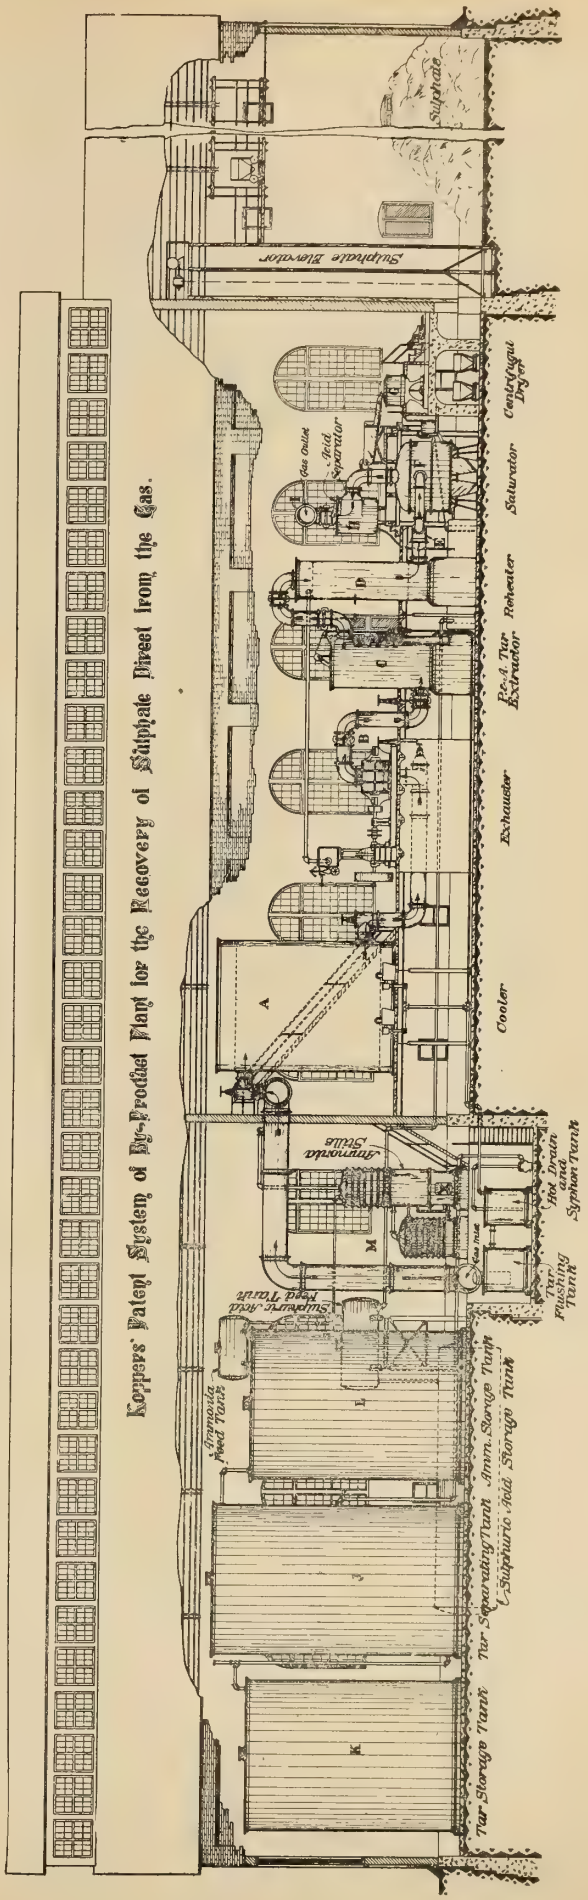

Fig. 3. Koppers' Patent System of By-Product Plant for the Recovery of Sulphate direct from the Gas.

of superiority we can readily understand why this type of oven is being built so extensively.

Koppers' Direct Process of Ammonia Recovery.

Passing from the ovens to the by-product plant, we find that here also there has been decided improvement in methods and results. The Koppers' patented direct process for the treatment of the gas and the recovery of ammonia has been installed in 28 plants, including 2,693 Koppers' by-product ovens. In the old system of gas treatment, the gas was first cooled in condensers to remove the tar and was then washed, or scrubbed with water, in a series of scrubbers, to remove the ammonia. The ammonia was collected as a solution of weak ammonia liquor. This weak liquor was then concentrated by treatment with steam in ammonia stills. The product from the stills was either in the form of concentrated liquor, containing 15 per cent. to 20 per cent. of $N H_3$, or the hot concentrator vapours were passed into sulphuric acid saturators to form ammonium sulphate salt.

In the Koppers' direct process, all of this is very much simplified, a larger yield of ammonia is recovered from the gas, and a superior quality of ammonium sulphate is produced.

In the Koppers' direct process, the tar is removed by condensation in a tubular condenser and by mechanical friction in a P. & A. tar extractor. The gas free from tar and at a temperature of 90 degrees to 100 degrees F., is then reheated by passing through a re-heater, the heat being supplied by the exhaust steam from the exhauster, which apparatus pumps the gas with a constant vacuum from the ovens and forces it through the by-product apparatus. In the re-heater, the temperature is raised to 155 degrees to 165 degrees F., at which temperature the gas passes directly into the sulphuric acid saturator. Here all of the ammonia in the gas unites with the sulphuric acid in the bath and is recovered directly as ammonium sulphate. The gas, free from tar and ammonia, next passes into the balancing holder, which forces some of it back to the oven burners to heat the ovens. The balance of the gas, amounting to from 50 to 60 per cent. of the total, is available for gas engine fuel or other purposes. If it is desired to market this surplus gas to domestic consumers, it is necessary to pass it first through iron oxide purifiers to remove the sulphur existing as hydrogen sulphide, and then into a storage holder supplying the distribution system.

Koppers' direct process has many advantages over the old system of gas treatment. Besides being a much simpler process, it is decidedly more economical in operation. In this process, the only ammonia liquor to be handled is that which condenses out of the gas in the foul gas main, coolers and tar extractors; while in the old system, the gas is scrubbed with water to dissolve out the ammonia, thus producing large volumes of ammonia liquor to be stored and concentrated, before the ammonia can be absorbed in the saturator. All this handling of ammonia liquor results in more or less loss of ammonia. Therefore, we can readily understand why the direct process gives a much higher yield of ammonia per ton of coal. Also, the expense of recovering ammonia by the old system is much greater than by the direct process, this being due to the large amount of ammonia liquor to be pumped and concentrated in the old system.

Our admiration for the simplicity and economy of operation of the Koppers' direct process, and for the efficiency of the Koppers' by-product regenerator coke ovens is so great that we feel that the industry must be congratulated on the progress made along these lines.

BITTER CREEK, B.C.

The Director of the Geological Survey has just received a report by Mr. R. G. McConnell on the recent discovery of gold on Bitter Creek, Stewart, B.C. Mr. McConnell, who is one of the best known members of the Geological Survey staff, has been in the Portland Canal district since the spring, making a geological survey of the district. He has just examined the new discovery at Bitter Creek, concerning which very exaggerated accounts have been circulated.

Mr. McConnell states that "the discovery was made on the precipitous sides of a mountain built of slates or shales with occasional graywacke bands, seamed horizontally with numerous granitic and dioritic dykes some of them 20 to 30 feet thick. The slates dip at an angle of 40 degrees and are fairly regular. The ore occurs in zones following generally the dip and strike of the slates but cutting them in places at a low angle. The principal zone has a thickness at the only place where it is accessible of about 15 feet and consists of silicified slate and quartz carrying more or less iron pyrites. In places layers of almost pure iron pyrites occur. A red zone at about the same elevation (600 feet above the glacier) can be seen at intervals running horizontally along the mountains for a distance of about 3,000 feet. It is interrupted by several rock slides, and for most of its course passes along inaccessible cliffs. The width of the zone ranges from 5 to about 20 feet.

"Assays made here from specimens brought in by prospectors are reported to run from $3 to $8 in gold per ton. Some rich assays were obtained from oxidized float, but these of course do not mean much.

"Besides the main zone several other similar silicified zones, none traceable for any great distance, outcrop at various points on the mountain slope. The principal mineral in all of these is iron pyrites, with occasionally a little chalcopyrite and at one point a small seam of galena.

"Vein matter in the mountains is abundant, but the contained values, so far as known, are low, so low that it is still doubtful if they could be extracted at a profit. The ore occurrences are, however, promising enough to justify some expenditure in exploration. The mountain has not been thoroughly prospected, in fact, most of it could only be prospected with the aid of a balloon. Good looking float is abundant in the slides, and there is a good chance of finding richer shoots than any yet discovered.

"The transportation question, if pay ore in quantity is discovered, has its difficulties, but these could be overcome if the deposits prove valuable. The valley is filled with a glacier from half a mile to a mile in width, which extends down for three miles below the discoveries. Farther down snow slides sweep both sides of the valley at a number of points. The grade on the three miles of glacier is 700 feet to the mile, and on the lower 6 or 7 miles to the Bear R. Forks 100 feet to the mile."

The above substantiates the opinion expressed by the Survey concerning the first exaggerated accounts, namely, that it would probably be found that the discovery, while affording encouragement to prospecting does not justify a wild rush into the camp. It is a rugged Alpine country, hence somewhat dangerous for tenderfeet unaccompanied by an experienced mountaineer.

THE CLAY AND SHALE DEPOSITS OF NOVA SCOTIA AND PORTIONS OF NEW BRUNSWICK AND PRINCE EDWARD ISLAND.

(Continued.)

Coal Measures.—These represent the most important clay and shale-bearing formations of Nova Scotia, and were carefully examined in the several areas in which they occur. The largest is the Sydney field, of Cape Breton, and extends from the Big Bras d'Or Channel to Cow Bay, with only one important interruption, at Cape Percy on the northeastern shore of Cow Bay, where the Millstone Grit cuts out the Coal Measures.

Owing to the almost uninterrupted line of cliffs which fringe the shore-line, a fine series of exposures was obtained. The Sydney coal field is cut into several parts by somewhat deep northeast-southwest bays; which has rendered it difficult for geologists to correlate the sections of the several subdivisions of the field. It can be said that the coal seams are interstratified with a series of shales and sandstones. These are bent into a number of gentle folds, forming the bottom of a broad trough which dips out under the sea. Throughout the field, therefore, low dips prevail. This gives the beds broad outcrops, but still the dip is sufficient to carry the bed rapidly under cover. Toward the northwestern and southeastern parts of the field the sandstone beds predominate, and the shales are of poorer quality, but in the central portion the shales are as abundant as the sandstones. The shales themselves range from smooth, fine-grained, plastic ones, of grey or red colour, to others which are quite siliceous in their character, and of doubtful value. One important deposit is found underlying a large portion of Cranberry head, near Sydney Mines. It is a smooth, greyish shale, and may prove of value for vitrified wares. In the final report it will probably be referred to as the Cranberry Heay type, as it appears at a number of points. A second type found at a number of localities in the Nova Scotia Coal Measures is a somewhat soft, reddish shale, well exposed along the shore just west of Cranberry Head type, as it appears at a number of points. siliceous in appearance and touch, and it would be unwise to express any definite opinion on them until the tests have been completed.

It seems curious that up to the present time these shales have been completely overlooked; and while it is true that they do not occur in deposits of great thickness, still they are easily accessible, and are capable of supplying a considerable quantity of raw material.

Numerous references to fireclays in the Sydney field have been published, but as far as we were able to ascertain, this region does not contain any high grade fire-clays, although some of them may prove to be low grade. Unfortunately most coal miners have formed the habit of calling any "under clay" a fire-clay.

Pictou Field.—In this field there are numerous shale beds associated with the coal seams, but they are best developed in the central portion of the area, and the most important known up to the present time are higher up in the section than the coal beds. Many of these shales when ground and mixed with water are of strong plasticity, but they unfortunately contain such a high percentage of carbonaceous matter as to require great care in burning, and some of the shale beds are too high in carbonaceous or petroliferous matter to be used at all; while others have to be avoided on account of the abundant siderite concretions; but in spite of these disadvantages, the field is an important holder of commercially valuable shale deposits. In some parts of the section, as along Coal Creek, south of the Allan shaft at Stellarton, the beds of shale are occasionally quite free from carbonaceous material. In only one instance is an under-clay worked, viz., at the Drummond Colliery at Westville, where a hard shale is mined for the manufacture of bricks. The most important utilization of the shales is near New Glasgow, where they are made into common and pressed brick, flue linings, sewer pipe and drain tile. Pleistocene drift clay is sometimes added to the pipe mixture.

Inverness Field.—This small field carries a number of shale beds associated with the coals, but few of them are of great thickness; indeed, none of them are equal in volume to those worked in the Pictou area. A good bed outcrops on the shore a few hundred feet south of the dock, and a plastic shale is said to underlie the 7-foot coal. Most important, however, is the bed of grey, plastic clay which overlies the 13-foot seam, and is found at several points where that seam is cut through by streams. It is, probably, a No. 2 fireclay, and varies in thickness from 18 inches to 3 feet. If the tests prove it to be of refractory character, it would be practicable to work it in connection with the coal.

Port Hood Field.—Here, too, there are scattered shale occurrences in both the Millstone Grit and Coal Measures; but the most important is along the shore a short distance north of Judique harbour, where a bluish-grey shale, with a vertical dip, and about 8 to 10 feet thick, outcrops for some distance along the shore.

Joggins Area.—This field contains a number of thin shale seams interstratified with sandstone in the Coal Measure rocks, but few of them are of any thickness. The most important, perhaps, is south of McIntyre Brook; while a second one, of possible value, underlies the coal seam at Joggins.

Pleistocene Clays.—These may be roughly divided into two classes: (1) glacial clays, usually of stony character ,but very plastic, tough, and red burning; and (2) marine clays, often strongly laminated, but also quite plastic and red burning. These two types of clay are rarely used for anything but drain tile and common brick. A few pressed bricks are made from them, and the smoother ones could be utilized for the manufacture of common ornamental terra cotta and cheap art pottery. The marine clays are best developed in the Annapolis and Shubenacadie Valleys, while the stony, glacial clays are worked mainly in the Cape Breton region.

A most remarkable clay, and one of undetermined age, is that found at Shubenacadie and in the Musquodoboit Valley. The material is a highly-plastic clay, of dark grey, white, or mottled red and white colour, lying beneath the glacial drift, and resting, possibly, on bedrock. Its thickness, as indicated by a series of borings made by Mr. Keele, ranges from 7 to probably 50 feet. Scattered lumps of lignite were found in the clay at Shubenacadie, and it is hoped that the age of these can be determined.

It is exceedingly difficult to determine the exact area underlain by this deposit, owing to the heavy mantle of glacial drift covering the region; but the fact that the material is found at several points extending over a dis-

tance of 7 miles, indicates its probable extent, unless some of the masses have been pushed along with the drift. Borings could, of course, only be made at those points where the drift cover was thin or absent.

The clay burns to a cream colour, and fairly dense body at a comparatively low temperature. It is at least semi-refractory in its character, and may prove to be a stoneware clay. Some test bricks were made from a carload lot of this clay, taken from a shaft sunk in the deposit at Shubenacadie.

It is safe to say that nothing like it has been found elsewhere in Nova Scotia, and its resemblance to some of the Cretaceous fireclays of New Jersey is striking.

New Brunswick.

As most of our time was required for the examination of the Nova Scotia clays, but little of the field season was left for New Brunswick. Several localities were examined, and the following is a condensed statement of the results.

In the vicinity of Albert Mines, in Albert County, there are some very promising beds of Devonian shales, which are probably of red burning character. In the event of the oil-shales at that locality being developed, these shales will be of importance for brick manufacture, but aside from this, they may prove to be of value for making pressed brick to be shipped to other markets. Nearby there are also red burning shales of lower Carboniferous age. Some of the latter are located along the line of the railway.

Many shale deposits, some of which may prove to be of refractory character, are associated with the coal deposits around Minto and Chapman, north-east of Grand Lake. Similar shales underlie and overlie the coal 12 miles south-east of Harcourt.

Marine clays are worked for common, and some pressed brick, at both St. John and Fredericton.

Prince Edward Island.

The only clay resources of Prince Edward Island are of Pleistocene age. Common brick clays are found at a number of points, but are worked to but a slight extent.

Clay Working Industry.

Up to the present time, the clay deposits of Nova Scotia have been but little developed. Common bricks are made at Annapolis, Middleton, and Avonport in the Annapolis Valley region, and at Shubenacadie, and Elmsdale in the Shubenacadie Valley. Other yards are in operation at Sylvester, New Glasgow, Pugwash, Eden Siding, and Mira River. In most cases these are operated to supply a rather local demand, although the Annapolis and Pugwash bricks are sometimes shipped some distance by water. Common pottery is made from the smoother sections of the surface clays south of Elmsdale. Most of the common brickyards re-press a few bricks. A hard brick, known in the trade as a firebrick, but not really such, is made from the Carboniferous shales at Westville. Sewer pipe, flue linings, and drain tile are made from the shales at New Glasgow; and some drain tile is manufactured in the Annapolis Valley by the same firms that produce brick.

It will be seen, therefore, that there is considerable room for expansion. If such development occurs, the markets will be mainly outside of the province; except for common brick. At present the buildings in that region are constructed mainly of wood; but as the supply of this becomes scarcer and more expensive, brick must be utilized as a substitute. For outside markets, the plants should be located as near to water as possib to avoid rail shipment.

It is hoped that the studies of the samples now bei carried on will demonstrate the value of the clay a shales for making pressed brick, vitrified brick, earthe ware, and perhaps stoneware, sewer pipe, etc.

THE FOLSOM DREDGE WORKING PLACE GROUND IN CALIFORNIA.

By Frank C. Perkins.

The accompanying illustrations show a moder dredge working placer ground in the Folsom distri in California, and it is stated that it has been mo successful in its operation, working with great econ my and rapidity. This gold dredge is said to have

Folsom Dredge.

capacity of 150,000 cubic yards per month, although i is maintained that this class of ground is exception ally hard to dredge. It is maintained that the machine could handle nearly 200,000 cubic yards per month in ground containing less cement.

Folsom Dredge.

It is of interest to note that the buckets of this gold dredge are of 8½ cubic feet capacity. The circular screen utilized in this work for sizing the gold-bearing particles is thirty-six feet long and measures over all about seven feet wide. This gold dredge was constructed at San Francisco, California, by the Western Engineering & Construction Company.

Mr. John Reddington has been appointed general manager of the Cobalt Provincial Mining Company. Mr. S. N. Graham, who was formerly in charge of the El Favor mine, Jalisco, Mexico, is superintendent.

CANADIAN MANUFACTURERS ASSOCIATION.

An Organization of Direct Service and Tangible Results

"The manufacturers must hang together lest they hang separately." In these terms—an adaptation of John Locke's famous definition of Government—a well-known Toronto professor tersely set forth the basic principle of the Canadian Manufacturers Association in addressing that body two years ago. A manufacturer battling single handed against an increase in freight rates or against legislation which threatens the ruin of his business is like a voice crying in the wilderness. His opponents strongly entrenched in their position, presenting a solid front and well backed by capital and influence, can easily dispose of their lone adversary. His arguments, sound as they may be and ably presented, fail to carry the day. But let our lone friend secure the co-operation of his fellow-manufacturers in the same town, or in the same trade and at once there is a difference. The railway company, let us say, is prepared to reconsider its position, friendly discussions take place, and ultimately a compromise is arranged that is mutually satisfactory.

History of the C. M. A.

Firmly imbued with the idea that union would bring strength, the manufacturers of Canada nearly forty years ago banded together to defend their interests. This was in the lean years of trade depression following the abrogation by United States of the Reciprocity treaty in 1866. United States had imposed quite a high tariff against Canadian goods, while Canada allowed United States products to come into Canada under a low revenue tariff. The policy of protection for home manufactures was decried on all sides, and the few manufacturers then established wielded but little influence. Conditions grew rapidly worse. With a view to devising some means of ameliorating them, meetings of the manufacturers were held as early as 1871. By 1873 the organization had taken definite shape under the name of the Ontario Manufacturers Association, with Mr. Joseph Simpson, of Toronto, as its first president. The next few years were devoted to educating the Canadian people to the importance of developing home industries under a policy of tariff protection. The triumph of the National Policy in the elections of 1878 affords convincing proof that the seed was well sown by these pioneer manufacturers and that it took good root. The eighties saw a tremendous development in the manufactures of the country. This development has continued with some temporary setbacks, down to the present day and seems likely to continue for many years. With prosperity abroad through the country the Manufacturers Association flourished. The Montreal captains of industry joined forces with those of Ontario about 1880. Under the aggressive secretaryship of Mr. Frederic Nicholls, now general manager of the Canadian General Electric Company, the association branched out in new directions, although protection was still the paramount issue.

Membership.

During the nineties the association fell away somewhat in membership and influence. In 1899, however, a reorganization was effected and under capable management it immediately took on new life, entering on its present broad sphere of usefulness. It became a national organization in the fullest sense of the word. With a membership extending from coast to coast, the "Made in Canada" policy was proclaimed throughout the land and advocated with a vigour never known before. The membership increased by leaps and bounds. From a scant 137 in 1899, located chiefly in Ontario and Montreal, it grew to 1,800 by 1905, while to-day it reaches the surprising total of 2,615, embracing all kinds of industries and scattered throughout every part of the Dominion.

Transportation Department.

The rapid growth in membership brought financial strength and greater influence. It paved the way for the establishment of special departments to handle difficulties common to all manufacturers. The transportation problem looms large in every industrial enterprise. It is surrounded with intricate regulations and tariffs which only a trained railway man can decipher. Very often the shipper does not know how he is affected by the alteration of a schedule until it is too late to protest. The adjustment of a simple claim for damages is fraught with uncertainty, because the shipper is ignorant of the terms and classification where the railway official is dealing with something he knows intimately. The transportation question was a live one in the association before the reorganization, and as soon as the sinews of war were available it was decided to retain a railway expert to assist members, individually and collectively, in their fight for better shipping conditions. The creation of the Dominion Railway Commission about this time made it absolutely necessary for the manufacturers to appoint a qualified railway expert to look after their interests in this field. When the railways propose a change in rates, invariably calculated to bring them an increased revenue, their case is well prepared, and ably presented by men who are thoroughly familiar with every detail of the transportation question. To protect their interests, therefore, it became essential that the manufacturers should have the same expert assistance. For years the Canadian Manufacturers Association was the only force in Canada in a position to battle effectively against the railways. Imitation is the sincerest form of flattery. Its success through retaining a railway expert prompted the Winnipeg Board of Trade a few years back, and the Montreal Board of Trade last year to follow suit, while it is expected that the Toronto Board of Trade will also fall in line shortly. With the creation of the transportation department, the association was in a position to render direct tangible services to its members. In addition to giving information and advice on transportation problems generally, the transportation expert, in the last resort, will adjust claims for members, many of whom can testify to the effectiveness of his work in this respect.

Fire Insurance Department.

Fire insurance is another subject which interests all manufacturers. In this field, too, the association places at the disposal of its members expert knowledge and assistance in the fight for better rates. Risks are inspected and rated, and if the insurer wishes, his entire insurance is arranged by the association's expert with a minimum of expense and trouble. Remarkable savings have been effected by many members who have entrusted their insurance to the association's adviser.

No other business organization in Canada retains an expert to offer its members absolutely disinterested advice on the insurance problem. Out of the work of this department has developed two strong mutual companies. They are pioneers in factory mutual insuraance in Canada. Organized and operated along the lines laid down by the famous "New England Mutuals" their success now seems assured. In them the manufacturer secures insurance absolutely at cost. The insurance department has just concluded a long and successful fight against those clauses in the insurance bill which aimed at prohibiting unregistered mutual companies, such as the New England Mutuals, from accepting risks in Canada. The successful culmination of this fight means a saving of thousands of dollars yearly to factory insurers in Canada.

Tariff Department.

Two years ago the association further added to its facilities for direct service to the members by establishing a tariff department. It was fortunate in securing for this work a member of the Civil Service, whose twenty years' experience in the customs department at Ottawa gave him a knowledge of the Canadian tariff equalled by few. All enquiries regarding the tariff are answered fully and correctly. Members who have tariff difficulties of any kind refer them to the tariff expert and are assured that they will be capably handled. This service is absolutely unique in Canada, but its effectiveness has been demonstrated on many occasions. Tariff statistics and tariff information for all the civilized countries of the world are also available for members who require it.

Legal Department.

Only a few months ago the association branched out in another field. A solicitor was retained to act as legal adviser to the Parliamentary Committee. For many years the association's legislative work has been more or less hampered by the lack of adequate information about the laws of the various provinces and of the Dominion. With a lawyer on its staff the association is now in a position to investigate from the legal side every measure introduced in the parliaments of the country. The effectiveness of its work will, as a result, be materially increased. While the legal expert has been retained primarily to advise the Parliamentary Committee, information along certain lines will be furnished to members, but litigation will not, of course, be entered into.

Legislative Work.

The association, alone in Canada, maintains a service to watch legislation throughout the country. Every bill introduced in any legislature or at Ottawa is carefully checked over and if action is considered advisable to oppose or advance it in the interest of the members it is taken immediately and with the greatest possible effectiveness. A perusal of the newspapers when our legislative bodies are in session indicates the necessity of work of this kind. The association is, of course, not always successful, but at the close of each year it can point to many results which have benefitted its members. As far as organized labour is concerned, the association opposes it freely in the legislative field, but is not a strike-breaking organization in the same sense as the Employers Association. The great majority of its members are firm believers in the "open shop," but this is not a condition of membership, and several firms running under "closed shop" conditions are members.

Other Direct Services.

Firms interested in export trade can always secure general commercial information, lists of prospective buyers, agents, etc., through the association. Special reports are prepared on the market for Canadian commodities in any foreign country desired, and facilities are provided whereby members can obtain reliable credit reports on foreign customers at nominal cost. Quite a number of members have secured profitable foreign accounts through connections formed through the association. A free translation bureau is also maintained for the benefit of members. In fact the association acts as a general commercial information bureau and its services in respect to information concerning manufacturers are at the disposal of the general public.

Organization.

The association's official governing body is known as the executive council and is elected at the annual convention. Its members are chosen from representative industries and representative localities. The council meets once a month and is assisted in its work by various standing committees which guide the different departments in their work. Branch organizations flourish in the principal cities, numbering eight all told. These deal finally with matters of purely local interest and report their views to the council on questions of general interest. In addition there are about thirty trade sections organized to deal with questions that concern their respective trades. Some idea of the rapid growth and present size of the organization may be formed from the fact that the permanent staff has grown from a secretary and one stenographer in 1899 to an even thirty to-day, all of whom are devoting their whole time to the work. The association publishes an official organ known as "Industrial Canada."

In sketching the history of the association, it was made clear that its foundation was based on the tariff question. It was maintained and directed for many years solely for the purpose of building up a strong protectionist sentiment in Canada, and notwithstanding the recent statements of certain journals with free trade leanings the tariff question is still a vital issue in the association. It is the only body in the country fighting in behalf of the industries of Canada and without its restraining hand many of them would lose the tariff protection that now enables them to exist. Of course the increased attention the association has given to the transportation problem and the other problems manufacturers are confronted with of late years, has detracted to some extent from the tariff issue. In the old days protection was the sole issue in the association. To-day it is an important question, it is true ,but not the only question manufacturers are interested in. With reciprocity negotiations pending, it will become more prominent in the association in the next few months.

With many of its policies condemned by a section of the press, the free trade west, and very often by organized labour, the Canadian Manufacturers Association has no bed of roses to lie in. Much of the opposition is due to ignorance. The association is by many dismissed in a word, "High Tariff." Its critics do not stop to consider what it has done, and is doing to secure better freight rates and shipping conditions, better insurance rates, and fairer laws for the transaction of business throughout the various provinces. Its direct services to its members and to the country are overlooked. From these unfriendly and prejudiced critics it asks only fair examination.

It is the manufacturers' own organization. They recognize in it a wise investment yielding large dividends. It has flourished now for over a generation, and these is no reason to believe that it will not continue to flourish in the years to come. To-day it is Canada's strongest and most representative national organization.

H. D. Scully,
Assistant Secretary,
Canadian Manufacturers' Association.

August 8th, 1910.

UNITED STATES NAVY TO TEST PACIFIC COAST FUEL.

While there is nothing to indicate whether or not British Columbia coals will be included among those to be tested, the possibility of their being so may cause interest to be taken by British Columbia Coast coal mine owners in an announcement contained in correspondence from Washington, D.C., relative to intended fuel tests to be made by vessels of the United States navy, published in the New York "Engineering and Mining Journal" of July 23rd. The correspondent of the "Journal" says: "The United States Navy Department has determined upon an experiment to test the steaming power of representative Pacific coast coals and will direct the making of the tests on board of one of the larger cruisers on the Pacific coast early next autumn. The test will be intended to show the comparative value of the northwestern coal as fue land should it prove satisfactory, it may result in a change of policy leading to the bandonment of the recent plan of shipping to the coast the Pocahontas and other coals heretofore in vogue. The action of oCngress in setting aside 10,000 acres of Alaska coal land for the use of the navy was taken in pursuance of recommendations based upon the desire of the department to supply itself more largely with Pacific coast fuel for the future."

PERSONAL AND GENERAL.

Mr. J. J. Harpell sailed for Toronto from England on August 6th.

Mr. J. C. Murray has been in Nova Scotia for the past two weeks.

Mr. J. B. Tyrrell is just leaving for a short visit to London, England.

Mr. Julius Lewisohn spent some time in Cobalt recently examining the Kerr Lake property.

Mr. Robert R. Hedley left Vancouver, B.C., recently on a trip to the Skeena River and Portland Canal districts.

Mr. Gordon Pharo has been appointed manager for the British and American Asbestos Company at Robertson, Quebec.

Mr. Alexander Dick, general sales agent of the Dominion Coal Company, will have his headquarters at Montreal.

Mr. O. N. Scott has returned to Toronto. Mr. Scott is still connected with the Cobalt Provincial Mining Company.

Mr. Harold Parker, of Thetford Mines, Que., has accepted the position of superintendent of an asbestos mine in Wyoming.

Mr. S .S. Fowler, general manager of the Canadian Metal Company, has returned to Riondel, B.C., from a business visit to Europe.

Mons. J. de Perpigna recently arrived at Kaslo, B.C., from France to supervise the installation of plant and machinery at the Joker group mine, at the head of the south fork of Kaslo Creek.

Mr. Neil McL. Curran's resignation as manager of the North Star mine, owing to ill-health, caused by lead poisoning, has lately been announced by the directors of the North Star Mining Company.

Messrs. J. B. Tyrrell, H. E. T. Haultain, F. D. Adams, J. B. Porter, W. H. Aldridge and W. H. Trewartha-James have been re-elected Corresponding Members of the Council of the Institution of Mining and Metallurgy for the current year.

Mr. Peter Christianson, until recently one of the district mine superintendents of the Dominion Coal Company, N.S., has been appointed general superintendent fo rthe Pacific Pass Coal & Coke Company, to direct prospecting on its coal areas in the Little Pembina River region, Alberta. Mr. Alexander McDonald, for years manager of Dominion No. 4 (Caledonia) colliery, has succeeded Mr. Christianson as superintendent of No. 3 district.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Technical Education Commission.

The Technical Education Commission spent the 1st, 2nd and 3rd of August in Sydney, Glace Bay and Sydney Mines respectively. The proceedings were necessarily very much hurried, considering the many things they wished to see and the short time at their disposal. The chairman explained that the work of the Commission would have to be carried out with great economy of time to enable their labours to be completed within a reasonable period, but, granting this, it was generally felt that three days was a very small proportion to devote to so populous and extensive an industrial centre as that surrounding Sydney. Nevertheless, the Commission made good use of their limited opportunities, and the sitting which was held in Glace Bay elicited much interesting and useful information.

All the officials of the Coal Company who testified before the Commission stated that the most useful part of their technical education had been obtained through the medium of evening classes and correspondence courses. It was stated that, almost without exception, the official staff of the Coal Company, from the grade of overman to that of superintendent, was indebted to the night mining schools, carried on by the Provincial Government, for the instruction which had enabled them to obtain the certificates of competency required by the law, and, incidentally, the International Correspondence Schools of Scranton obtained a striking advertisement. The impression gathered from the evidence given was that the Provincial mining schools had fulfilled a decided want and had paved the way for still better things, and the general concensus of opinion was voiced by the chairman, who stated that the evident desire for the enlargement and improvement of the technical education in mining now afforded by the night mining schools implied no criticism or belittlement of these schools, which had most evidently been pioneers in mining instruction. The testimony of the superintendents of the Dominion Coal Company elicited the fact that every one of them had achieved his present position by dint of

persevering study, and their evidence was in striking contrast with some evidence given before the Commission at a sitting in Sydney on the previous evening, where several workmen volunteered the information that evening classes involved "hardship" and "exhaustion of vitality." One man went so far as to intimate that what he chiefly desired was a "soft job." It is to be hoped that in their progress through Canada the time of the Commission will not be wasted by the giving of evidence of this kind.

The Commission visited Dominion No. 2 Colliery and were shown through the surface works. But judging by the time which was occupied in their progress, the impressions they obtained must have been kaleidoscopic and fleeting. The small acquaintance of the members of the Commission with mining operations was apparent, and there could be no doubt that even the excellent personnel of the Commission would have been much better balanced had it contained a representative of the mining profession. Considering the great importance of the products of the mine to this Dominion, the omission is a noticeable one, particularly in Cape Breton.

Dominion Coal Company's Output.

The output by collieries for the month of July has been as follows:

	Tons.
No. 1	49,464
No. 2	66,166
No. 3	27,749
No. 4	40,589
No. 5	32,238
No. 6	24,833
No. 7	21,863
No. 8	15,971
No. 9	37,583
No. 10	14,672
No. 12	18,254
No. 14	4,094
No. 15	1,018
	454,494

These individual outputs show several records. The monthly production from No. 9 Colliery has only been exceeded on one previous occasion, and the outputs from Nos. 6 and 7 and the Lingan collieries constitute records for one month. The aggregate output of the Lingan district amounted to over 23,000 tons. Considering the unusually small number of working days in the month, the output was a very satisfactory one. The aggregate outputs for the 7 months ending July 31st for the past three years compare as follows:

	Tons.
1908	2,299,724
1909	1,764,897
1910	1,909,494

This month marks the anniversary of the beginning of the U. M. W. strike at the mines of the Dominion Coal Company, probably one of the most useless and futile struggles in the history of Canadian trades unionism. During the first month of the strike the output was 136,697 tons, and before the strike collapsed the production reached 243,000 tons per month. It is, therefore, no matter for wonder that Mr. Edwin Perry, International Secretary of the U. M. W., should have found it difficult to understand why the strike was ever called. In a letter written by this gentleman to the U. M. W. Journal, after his visit to Glace Bay in June, he states: "I am not advised fully why the strike was called in the mines controlled by the Dominion Coal Company. Considering the fact that there were at least 8,000 or 9,000 men at work in Nova Scotia compared with approximately 3,000 idle, it seems to me that it would have very little effect on the production, but, of course, those familiar with the conditions were confident of victory." Before the strike the leaders of the U. M. W. in Glace Bay claimed to control 5,000 employees of the Dominion Coal Company, and it is decidedly refreshing to meet a true statement in the U. M. W. Journal. As a matter of fact, 3,000 men was about the number of adherents the U. M. W. cause had in Nova Scotia in the spring of 1909, including Glace Bay, Inverness County and Cumberland County. It will be a more difficult matter for the responsible officials of the U. M .W. to explain why—with a following of only one-third of the miners of Nova Scotia—they introduced a period of lawlessness and intimidation without parellel in the history of this province, carrying in its train permanent injury to the coal trade of Nova Scotia and leaving behind a legacy of bitterness and unpleasant reminiscences which it will take a good many years to efface. Mr. Perry further remarks that: "Invariably a body of men not familiar with the fundamental principles of unionism believe that the first thing to do is to revolutionize conditions of employment, wages, etc., with the result that a strike is precipitated, not taking into consideration the consequences or cost."

Your correspondent has before expressed the opinion that the United Mine Workers' strike at Glace Bay was called with a wanton and light-hearted disregard of the consequences, and it would be difficult to adduce more substantial corroboration of this view than is given by Mr. Perry himself.

ONTARIO.

Cobalt.—The Cobalt Townsite, which is now under the management of Mr. Charles Watson, recently shipped another car of high grade ore. This property was shut down for a considerable period but work was finally resumed by English capitalists and since that time the prospects of the property have been steadily improving.

Two new veins have been discovered on the Trethewey in the vicinity of the No. 4 shaft. They were opened up by a cross-cut, which is being run to connect that working with the No. 2 shaft. Although narrow, they are both high grade and carry a considerable quantity of milling rock. The concentrator is working steadily putting through on an average about one hundred tons a day, and a very good extraction is being obtained.

The winze below the bottom level of the Little Nipissing has opened up a considerable quantity of ore and materially augmented the reserves. The management now believe that they will be in a position to ship approximately one car of medium grade ore per month.

There has lately been a good deal of activity in the neighbourhood of Smooth Water Lake, in the Gowganda district, and a number of good veins of silver have been found in the last few months. When this section was first called to the attention of the prospectors a large number of claims were staked, but owing to the superficial manner in which the prospecting was carried out the results obtained were very meagre. Since that time a large proportion of the claims were allowed to lapse, but these are rapidly being restaked, as development has proven the existence of native silver.

The Silvers Limited, which company is operating the Armstrong Fraction in Gowganda, has run short of funds, and it has been decided to cease operations. A meeting of the directors was called recently to see whether or not they would raise any more money to carry on the work, but the reports were not sufficiently encouraging to warrant them putting any more money into the enterprise. When the property was first staked a very rich surface vein was discovered, but the values were found to carry for only a very short depth.

An important find was made a short time ago on the two hundred foot level of the Crown Reserve. A long cross-cut is being run down the lake to open up veins which were cut by the diamond drill. At a distance of about nine hundred feet from the shaft the new vein was encountered. It is about eight inches wide of high grade ore. The management believes that this is not one of the veins cut down by the diamond drill but is an entirely new one.

The Cobalt Hydraulic Company has recently experienced considerable difficulty in keeping down the consumption of their air and as a consequence there was for a time quite a serious drop in pressure, necessitating some of the mines starting up their compressors. While only a few drills have been added to the original load, the consumption has increased from about two thousand cubic feet per minute to almost double that amount. This is due to the fact that the air is being wasted at the mines. The company has so far been unable to place meters and reducing valves on its lines, which would keep the consumption down to the amount contracted for. They are now, however, installing the meters and valves, and it is expected that the pressure will shortly again be normal.

Since the Gould Consolidated Company at Cart Lake has stopped underground operations a diamond drill has been started. This is being run in an endeavour to locate some veins which are supposed to come over from the Nipissing.

Good progress is being made on the Bailey property, and it is expected that the tunnel which is being run toward the old workings will cut the Bailey vein in a short distance. A considerable quantity of high grade ore was taken from this vein when the Bailey was under lease to the Cobalt Central. The main shaft is also being sunk and it is probable that the Huronian slates which underlie the diabase will be cut shortly. In the adjoining property this formation was found to be the most productive and when it is reached on the Bailey, a cross-cut will be run to cut several veins which were worked on the upper levels.

Work has been started on the Airgoid property, which is now being operated by the Cyril Lake Mining Company. Considerable trenching is being done, and it is expected that a new shaft will be started shortly.

The report of the Buffalo mill for the month of June shows that 2,918 tons of rock having an average assay of 26.2 ounces were treated; the mill ran 465 hours at a total cost of $5,452.37. Several changes have recently been made in the concentrator and also in the cyanide plant, by which it is expected to materially increase the extraction. Heretofore the cyanide plant has been making an extraction of about sixty per cent. on thirteen ounce slimes, but this was not considered satisfactory.

It was expected that the strike of the conductors and trainsmen of the G.T.R. would tie up traffic on the T. & N. O., but the trouble was not as great as was anticipated. Passenger traffic was interfered with to some extent, but on account of the C. P. R. trains running through from outside points, little difficulty was experienced. The biggest tie-up was, of course, with the freight, but the mines suffered no inconvenience from this, as practically all the ore was shipped out over the C. P. R.

A new ore shoot has been opened up in the drift at the sixty-eight foot level of the Bellellen property in South Lorrain. The vein is about ten inches wide and carries very high values in silver.

The Government reports for the first six months of the present year show that about two-thirds of the ore shipped from Cobalt has been treated in the States. The distribution is as follows:

	Tons.	Per Cent.
United States	9.816.7	66.13
Canada	4,782.63	33.22
England	153.65	1.00
Germany	90.10	.65

Although the larger per cent. of ore was treated in the States, practically 75 per cent. of the total silver was produced by Canadian smelters. This is due to the fact that the Canadian smelters take only the highest grade ores, and as their rates are much better than can be obtained on the other side of the line, they consequently have all the ore they can handle. There are no smelters in Canada that will treat low grade ore, with the exception of the Trail smelter in British Columbia, but freight rates to this point are so high that they do not get any ore. The total production for the six months was 14,843.08 tons. The largest tonnage for any one month, 2,917 tons, was shipped in June, while January had the smallest showing, 2,025 tons.

Another dividend of 300 per cent., payable July 29th, has been declared by the Temiskaming & Hudson Bay, thus making a total of 12,000 per cent. so far this year, or $93,112. This high percentage is due to the low capitalization, which consists of only 7,761 shares having a par value of $1.00 each. A new vein carrying extremely high grade ore has been discovered on the second level about twenty feet from the No. 1 vein. Good progress is being made with the erection of the concentrator, and the cement work will be started in a few days.

The development of the third level of the Coniagas has been very satisfactory. Three of the principal veins have now been opened up at the depth of 225 feet, and it is expected that others will be cut in the near future. On this level the veins are, if anything, wider than on the upper levels, and show no diminution of values.

In the case of the Lucky Godfrey, at Elk Lake, against some of their employees for high grading, no evidence was adduced to show that the men took the ore and the case was dismissed. The company is entirely at a loss to understand how the ore disappeared. They valued their car at approximately $40,000, but when it reached the smelter it was found to be worth only $5,200. It is understood that one of the men is suing the company for wrongful arrest.

The Off Shoot vein of the Chambers-Ferland has been picked up in a cross-cut on the third level. It varies in width from one to two inches, but is very high grade and assays about 4,000 ounces to the ton.

In the future the Right of Way expects to ship about three cars of ore per month; one of high grade and two of low grade. The company is now working three veins carrying high grade ore. The ground to the south of No. 3 shaft is being prospected by a cross-cut from the old shaft of the Little Nipissing. So far nothing of importance has been found there.

A new surface vein has been found on the Silver Alliance at Elk Lake. It is about three inches in width and in places shows almost pure native silver. It has already been traced for a distance of over one hundred feet and a shaft has been started.

A diamond drill is being operated on the Provincial property to prospect the ground under the swamp at the head of Cart Lake. The shaft near the Savage line has been sunk to the 170-foot level and a station has been cut. Two high grade veins will be developed from this point.

During the month of July the ore shipped from Cobalt totalled 3,015 tons, as against 2,325 tons for the corresponding period last year. This increase is largely due to the much heavier shipments from the Kerr Lake section of the camp .

Porcupine.—One of the most important deals in the Porcupine country was recently consummated when Mr. Lorne McGibbon, president of the La Rose Consolidated, and his associates, took over seventeen claims known as the Dobie properties. These claims were among the first staked in the district, and several fine showings of free gold have been reported. It is understood that they will be opened up as soon as possible. The entrance of Mr. McGibbon into the new gold fields will doubtless have an important bearing on the attitude in which the country will be regarded by many other investors.

It is stated that gold has been found on the Cartwright claims, which are located near the shore of Gillies Lake in Tisdale Township. The main vein is about fifteen feet in width and has already been opened up for a considerable distance.

On account of the low water in the rivers and lakes, transportation of supplies has become an exceedingly difficult matter. The low water was caused by the action of Father Paradis in blowing out the falls on the river, which lowered the water about eight feet. To overcome this difficulty and raise the level of the water sufficiently to allow the running of gasoline launches, it was decided to build a dam. Considerable work had already

been done when orders to cease operations were received from the Dominion Government. Engineers are now in the district examining into the conditions, and it is believed that permission to resume the work will be given shortly.

It is reported that the four Hollinger claims, upon which the Timmins have been concentrating their energies ,will be organized into a company known as the Alpha Gold Mines, with a capital of $3,000,000, about $1,000,000 of which will be offered to the public. A great deal of work has already been accomplished on these claims, and the results so far have been extremely encouraging. The main shaft is down about one hundred feet, and at this depth the vein is ten feet wide and carries extremely high values in gold. A small prospectors' stamp mill has been erected and is treating about fifteen tons a day. Plans are being prepared for a new mill to have a capacity of about one hundred tons a day.

A half interest in the McIntyre claims has been purchased by local men. These claims have some of the best showings in the district, but, so far, have not been developed. As soon as supplies can be obtained a force of men will start to work.

Operations on the Foley-O'Brien have been suspended owing to the shortage of supplies and high freight rates. Work will be resumed as soon as supplies can be brought in at a reasonable cost.

Development work on the Dome property is progressing very satisfactorily. A few days ago the diamond drill cut the vein at a depth of one hundred feet and the core showed spectacular values in free gold. Another large payment on this property was made on the first of August.

The Dome Extension, which adjoins the Wilson Dome, has been forced to stop work until the road from Matheson has been cut through.

A complete plant has been ordered for the Foster property and will be brought in as soon as the road is in shape. A large amount of surface work has been done in stripping the big vein for a distance of about eight hundred feet. The shaft on the Scottish Ontario has reached a depth of eighty feet. It will be continued to the one hundred foot level, from which point a cross-cut will be run to open up the vein.

Survey parties have already been sent in to lay out the route for the new electric railroad. The line will be approximately thirty-five miles long and will start from some point near Matheson. No difficulty will be experienced with grades, as the country is practically level. Although this line will eventually be operated by electricity, it will be impossible to have that power ready by the time the road is completed. The charter states that the work must be finished in five months, so that it will be necessary to operate by steam until such time as the electric plant is in commission. The Mines Power Company of Cobalt has taken a lease on a splendid water power a few miles from Porcupine, and as soon as the winter roads are in shape will start the erection of its plant. It is expected to have a capacity of about six thousand horse-power.

BRITISH COLUMBIA.

The amendment to the "Coal Mines Regulation Act," made at the last session of the British Columbia Provincial Legislature, which requires that oxygen helmets or other mine-rescue appliances shall be provided and mine-rescue stations established at every colliery in the province to which the Act applies, is to come into force on November 1st of the current year, the Lieutenant-Governor in Council having had gazetted a proclamation which will then bring into effect the section of the amended Act in this connection.

The prospects for the early establishment of an operating steel-making industry in British Columbia do not appear to be encouraging at present. It has been the custom of two or three interested parties during the last year or more to give publicity to statements purporting to show that Mr. J. A. Moore, of Seattle, Washington, and his associates in a proposed iron and steel manufacturing enterprise for British Columbia, would ere long launch such an undertaking. Incidentally, much importance was attached to the stated occurrence on Vancouver and other British Columbia islands of immense quantities of ore suitable for the manufacture of pig iron, and it was implied, if not asserted, that when Mr. Moore' company should commence to manufacture iron and steel at Irondale, Puget Sound, Washington, much British Columbia iron ore would be used in the furnaces there. It has lately transpired that the greater part of the material for such manufactures is to come from China, at least for the time, and shipments of pig iron from that country have already reached Irondale. Further, when asked quite lately in Victoria, so the "Colonist" states, "as to the intention of his company in regard to making steel in this province, Mr. Moore said the first thing was to get cheap coke, and this they expected to make on Graham Island," which is one of the Queen Charlotte group, by the way. As the commercial mining of coal has not yet been commenced on Graham Island, it would seem that the manufacture of cheap coke is not an early possibility, and consequently Mr. Moore does not seriously contemplate activity in the direction of making steel in British Columbia in the near future.

East Kootenay.—Lead mining at the St. Eugene and Sullivan mines, constitutes the chief metalliferous mining in this district this summer. Two small lead-silver properties situated within a mile or two of the St. Eugene are also having attention. Placer mining is in progress on Perry, Wild Horse, and other streams on which gold-bearing gravels occur.

Coal mining in the southeast part of this big district is being steadily increased in extent of operations and quantity of coal produced. The producing collieries are those of the Crow's Nest Pass Coal Company at Coal Creek and Michel, and of the Hosmer and Corbin collieries, respectively, in other parts of the Pass district. The Fernie "Free Press" states that Mr. Frank T. Hoover is developing coal measures which are a continuation of those being worked by the Corbin Coal & Coke Company. This company last year opened a deposit of coal 200 feet in thickness, of nearly all clean coal, but this unusual thickness is said to probably be due to folding. The coal met with in the preliminary workings on the main seam, however, was at least 40 feet in thickness. There are also large deposits of coal of excellent quality being prospected in the upper Elk River region, but this district is at present without transportation facilities, being 50 miles or more from the C. P. R. Company's Crow's Nest Railway.

Slocan.—Announcement has already been made that the Rambler-Cariboo Mines, Limited, will without delay resume work in its mine in McGuigan Basin. To do this supplies for the miners will probably have to be taken in by pack train. Work is to be continued at the Lucky Jim also, so that the set-back resulting from recent fire losses may not be felt for long. In the Slocan Lake section, the erection of a concentrating mill for the Van Roi Mining Company is to be proceeded with. Grading at the site of the new mill was completed some time ago, but the erection of the superstructure and equipment of the mill was postponed until after matters had been fully considered by the directors in London. Meanwhile the company has been concentrating its ore at the Wakefield mill, to which an aerial tramway was constructed from the Van Roi mine about two years ago.

Ainsworth.—The Blue Bell mine, on Kootenay Lake, opposite Ainsworth, is to be operated again, the stated intention being to resume work this autumn, but it is probable production will be deferred for several months. Meanwhile the capacity of the concentrating mill is to be increased. One of the objects the general manager of the Canadian Metal Company had in view when he went to Paris early last summer was to discuss with the larger shareholders the question of supplying hoisting and pumping equipment for the mine, in which occur large bodies of ore below the level it has been practicable to work with existing

equipment. It is understood that present difficulties are to be overcome by additions to plant and ore-handling facilities.

Nelson.—In Nelson mining division, lode gold mining is having increased attention. The Granite-Poorman mine, situated within half a dozen miles of the city of Nelson, continues to supply ore for its 20-stamp mill, which last year crushed 10,500 tons of ore and produced about 4,600 ounces of gold and 1,500 ounces of silver. At Ymir several mines are being worked, and others in the Salmo and Erie districts, respectively. Sheep Creek is especially active, with the Queen and Nugget mines producing gold and a number of more or less developed prospects being worked as well. The Queen has a 20-stamp and the Nugget a 4-stamp mill. Reports of discoveries of gold ore giving high assay returns are frequent. The Bayonne district, east of Sheek Creek, is being prospected, too, and reports from this part are also favourable. The Emerald lead mine, Salmo, has shipped more than 1,000 tons of ore this year. The only copper mine in the division at present producing is the Queen Victoria, which has sent about 2,000 tons to the Trail smeltery.

Boundary.—Diamond drilling is in progress in the Granby mines at Phoenix, with the object of prospecting for new ore bodies at greater depths than those now being worked. The "Pioneer" states that ore bodies additional to those included in Dr. Sussmann's estimate of available ore are now known to occur, consequently the position is considered that much better than the report of the expert indicated. The 15-stamp mill for the Jewel mine at Long Lake is about completed and a preliminary run will shortly be made. In the Jewel mine there is much gold-quartz ore opened by development work 10 to 12 years ago, and since then more ore has been found in the course of exploration work. With much ore in sight and a modern plant to treat it, good results are expected.

Similkameen.—The Hedley "Gazette" reports gratifying improvement in results obtained at the Hedley Gold Mining Company's 40-stamp mill, both in regard to quantity of ore crushed and extraction of value. The tonnage for the month of June is stated to have been 4,574 tons, as compared with 3,829 tons in June of 1909. This record is 745 tons better than that for the corresponding month of last year and 1,170 tons higher than the average June record since 1905. Loss of gold in tailings is now less, it is claimed, than formerly. The Princeton Coal & Land Company, Limited, organized chiefly for the purpose of operating the coal mines near Princeton opened by the Vermilion Forks Mining & Development Company, is arranging to put in a screening plant and other coal-cleaning apparatus, so that a more marketable coal product may be shipped in the future.

Kamloops.—A Vancouver syndicate has arranged to acquire a group of mineral claims situated on Tranquille Creek. The ore occurrence is described as a large dyke of gold-bearing porphyry, samples of which have given good assay returns. Boring for coal is to be commenced shortly by a British Columbia com-

Coast.—The Great Granite Development Company has placed a 7-drill compressor on its Lucky Jim mine, on Valdez Island, where good value is reported from gold-copper ore. The managing director, on his return to Vancouver stated that there is 9 feet of chalcopyrite on the 100-foot level. Shipment of ore to the Tyee Copper Company's smeltery at Ladysmith, Vancouver Island, is to be commenced next month. Prospecting work with the diamond drill at the Ikeda Bay mine has been stopped pending completion of arrangements for purchase by the Vancouver syndicate that has the property under option. Mr. John McLellan has obtained good returns from two months' run of a small stamp mill at his Early Bird claim, Gold Harbour, Moresby Island. The Portland Canal Mining Company is pushing on with the work of completing equipment of its concentrating mill on Glacier Creek. The delay in completion has been unavoidable, transportation difficulties having hindered progress. It is expected, however, to have the mill in operation in September. Development work is being done on the claims of the Stewart, Red Cliff, and other companies. Undue importance continues to be placed upon specimen assays, though. It is hoped the Portland Canal Mining Company's operations will determine, before the close of this year, what value its ore will yield from treatment in bulk.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax.—Gold mining is going on at Montague. Several old mines and prospects are being worked and two stamp mills are operated. At Oxford, Manager Partington is getting things into good shape.

Moose River.—Manager A. A. Hayward is sinking and crosscutting in several places on the numerous scheelite veins. The scheelite property is controlled by a Canadian syndicate.

QUEBEC.

Montreal, August 2nd.—Announcement was made yesterday by President Harris, of the Nova Scotia Steel & Coal Company, that Mr. James Reid Wilson and Mr. K. W. Blackwell had been elected to the board of directors. Mr. Wilson is a prominent business man and a director of the Dominion Steel Corporation, and Mr. Blackwell is president of the Montreal Steel Works. The election followed the transfer yesterday of the large block of stock held by the Forget interests to the purchasing syndicate, headed by Mr. R. E. Harris, president of the company, for which Mr. Rodolphe Forget and his associates were handed a cheque for close to two million dollars.

ONTARIO.

Ottawa, July 28th.—The Canadian Peat Society was formed here yesterday afternoon. All the Canadians present at the annual meeting of the American Peat Society joined the new organization, and from now on a vigorous campaign will be carried on to interest Canadians in the peat industry and to join the new society.

Dr. McWilliams, of London, is the president, William B. Lincoln, of Montreal, vice-president, and Mr. A. J. Forward, of Ottawa, secretary-treasurer. The headquarters of the new organization will be at Ottawa, and its annual meetings will be held here. It will remain affiliated with the American society and will work along very similar lines to that society, but will not do much experimenting. It will approach the railways with regard to securing rates when necessary and be advisory to the government.

Ottawa, July 29th.—An official report to the Geological Survey by Dominion Geologist McConnell on the Bitter Creek gold discovery at Stewart, B.C., indicates that the first stories of the district were exaggerated. Assays run from $3 to $8 per ton. There is plenty of vein matter in the mountains, but

the values are low, making it doubtful if they could be extracted at a profit. The district is inaccessible in places, and a gold rush is not warranted by discoveries so far, though they are sufficient to warrant further prospecting.

Toronto, July 28th.—A meeting of the directors of the Boyd-Gordon property showed a complete change of officers and directors with one exception, and the company decided to put the lot under new management and begin active mining operations at once in Gowganda.

The new officers and directors are: Messrs. E. L. Duncan, Buffalo, president; Samuel Jardine, Toronto, vice-president; Dr. W. A. Rushworth, Toronto, secretary-treasurer; Major R. K. Barker, Toronto, and E. E. Groves, Buffalo. With the exception of Dr. Rushworth, this is an entirely new board. As the Johnson brothers are known to have held a seven-eighths interest between them and their names do not appear on the new list of directors, it would seem that a sale of some sort had been effected.

Toronto.—Application has been made for charter by Messrs. Arthur Ferland, W. C. Chambers, Charles Richardson, R. W. Gordon and A. E. Burdett to build a steam or electric railway from a point on the Temiskaming & Northern Ontario Railway, between Matheson and Mile Post 229, to the Mattagami River, a distance of 42 miles. This railroad would pass through the Porcupine gold fields and connect the Temiskaming & Northern Ontario Railway with the Mattagami River. Upon favourable action on the application it is said that work will start at once, under the direction of W. C. Chambers.

Cobalt.—Cobalt mine owners are pleased over the advance in the price of silver, which with the reduced working costs brought about by the cheaper power gives the industry a much stronger position. Estimating the output for the current year at 26,000,00 ounces of silver, an increase of 4 cents in the returns from smelters means $1,040,000 more available for dividends. While the added price for silver may not amount to 4 cents per ounce averaged over the whole year, the gain to the treasurers of shipping mines will be fully $750,000. There is greater inducement now for larger shipments, and it may be that the Cobalt industry will exceed the 26,000,000-ounce mark.

BRITISH COLUMBIA.

Phoenix.—Exploratory operations of importance have been begun on the property of the Granby Consolidated Mining, Smelting & Power Company. A diamond drill has been started on the 900-foot level, and will drive a series of holes to a depth of 1,000 feet. It has been generally believed that ore bodies of low-grade copper propositions in the Boundary district do not run down, though there has never been any satisfactory demonstration that there is not ore at depth. Up to the present time ore bodies have been found to be so large that it has never become necessary to develop at great depth, that it, below 600 or 700 feet. The starting of deep holes from the lower level of the Granby Mine, which is practically 800 feet below the surface, begins a new era of deep mining in the Boundary mining district. Gratifying results have followed recent diamond drilling on the southern part of the Knob Hill claim of the Granby group, hitherto undeveloped. Although no official information could be gained from the mine superintendent, O. B. Smith, it is learned that the drill has gone through 100 feet of good average ore, and the extent of the body has not yet been determined, though development work with this object in view has been commenced.

Lillooet, July 26th.—Messrs. Reinbold & Mellon have arrived from Lytton with a crew of miners. These gentlemen who represent the International Mining & Milling Company, of Everett, Wash., have secured leases of three miles of ground on Cayoose Creek some three and a half miles from Lillooet, where they purpose hydraulicking for gold. This ground was thoroughly tested by Mr. W. S. Reinbold this spring, and results justified an immediate start. Mr. Reinbold, who is a mining engineer of some repute, graduated at a German mining university and has mined in many countries and several states of the Union. He expresses much confidence in the richness of his leases and states that his company will spend some $25,000 this season alone, and if results are as good as expected, will extend their operations further.

Vancouver, B.C.—Manager Roy, of the Vancouver Industrial Exhibition, has announced that the directors have decided to grant a handsome cup for competition among mining exhibits which Nelson Board of Trade has decided to send to Vancouver's first fair. Hope is entertained in Vancouver that the exhibit can be retained here as a permanent exhibition.

Prince Rupert.—The "Prince Rupert Optimist," the bright daily newspaper of the new town, resents editorially the false reports concerning finds of gold at Stewart, and points out the evils that will ensue. It condemns heartily the authors of the grossly exaggerated reports that appeared in the London, England, papers.

Stewart.—Not only is the Canadian Northern Railroad going to continue its railway from Stewart to link with the trunk railroad at Edmonton, but also is projecting another line from Stewart to tap the mining districts at the head of the Salmon River and Fish Creek. This new line is to pass from Stewart through Portland City and through Alaska to the mines located in British Columbia at the headwaters of the Salmon, carrying ore through Alaska to Stewart.

Atlin, B.C., July 27.—Capt. Alexander arrived yesterday from the Engineer mine with the first gold bar produced on the property. The weight of the bar is twenty pounds eight ounces, the product of eight hundred pounds of rock, four hours' run of the two-stamp mill. This is considered the record run of the world. It is estimated that the bar represents only sixty per cent. of the value of the rock.

The mine has been working since January, and about two hundred tons of rock have been taken out, which will average $150 per ton. Three tons of selected rock will go six to ten thousand dollars per ton. These are conservative estimates. Numerous leads have been opened up, all showing values.

The owners intend to erect a hundred-stamp mill at an early date, for which purpose Capt. Alexander expects to leave shortly for England. Particulars of the mine have not heretofore been made public owing to possible litigation, all likelihood of which is now at an end.

YUKON TERRITORY.

Dawson, July 19.—Stewart Menzies, master mechanic of the Yukon Gold Company, was killed yesterday when a three-ton dredge fell on him while being swung into place by a crane. Menzies was a widely-known Klondiker.

Dawson.—Advices are to the effect that the season's output of the large placer operations is estimated at $5,000,000. This, it is said, is important in view of the fact that a very large part of it will come from ground that has already been mined once and abandoned. This yield, according to the despatches, is therefore practically from a waste product.

The principal operator in the old Klondike district is the Yukon Gold Company, which purchased a large number of abandoned claims on Bonanza and neighbouring creeks and which has spent several millions of dollars in experiment, and last year began working over the tailings and bench ground that could not be worked by the crude methods employed by the original owners.

MINING NEWS OF THE WORLD.

UNITED STATES.

Miami, Ariz.—The Miami Copper Company has resumed Sunday work on all construction operations. Superintendent Gottsberger plans to have the big concentrator in operation by January 1st, 1911. There is not an idle mechanic or carpenter in Miami and work on the mill is progressing rapidly. The mammoth smokestack is completed and is receiving the outside coat of plaster. The stack is 200 feet high. The concentrator is rapidly assuming shape and an army of painters and carpenters is closely following the iron workers as they place in position the massive pillars and girders of the structure.

Los Angeles, Cal., July 28.—Apparently vexed by the reports that it was diminishing its flow and about to sink to the rank of an ordinary, peaceable member of the oil fraternity, the great Lakeview gusher has again speeded up and is producing 35,000 to 40,000 barrels per day. This mammoth producer has been in operation since the middle of March, and has produced over 5,000,000 barrels of oil to date. Late tests show no water in the oil, and it is now believed that the presence of the fluid was owing to a leaking water pipe, running about 10 feet from the well. It is evident that the great oil geyser is slowly subsiding, but its sudden spurts of activity are still keeping its owners guessing. It is understood that the company has taken over the ten 55,000-barrel steel tanks of the Union Oil Company along the route of the Producers Transportation Company's pipe line, and is arranging to have reservoirs constructed at Coast points.

Leadville, Colo., July 29.—With a Starret compressed air pump, connected up with electric power from the Central Colorado Power Company, the Hellena mine, in Empire gulch, is being unwatered by a process novel in Colorado, but successfully tried out on the Pacific coast, notably at several points in Utah and at the Ward mine on the Comstock lode.

The Hellena shaft is 900 feet deep, and the water filled it within 80 feet of the collar. Already the water has been lowered 360 feet and two levels are now dry.

Boston, Mass.—The directors of the Calumet & Hecla Mining Company have sent to the shareholders a comprehensive report covering the operations for the year ending April 30th, 1910. The important facts brought out are: A refined copper production amounting to 72,108,577 pounds, or 10,707,653 pounds less than for the preceding year; the stamping of 2,865,900 tons of rock as compared with 2,699,919 tons in the year ending April 30th, 1909; a yield of 27.44 pounds of copper to the ton, as against 30.06 pounds in the previous year, and an addition to the surplus of $845,530, making the total surplus at the close of the year $7,667,298. The price of copper during the year varied from 14 1-8 cents to 13 cents per pound, and on April 30th—the closing day of the year—it was 13 cents per pound. Dividends aggregating $30 per share were paid during the year. In accordance with its usual custom, the management fails to give any definite facts regarding the producing costs and average selling price beyond the general information noted above.

Silver City, N.M.—The largest mining deal consummated in this section for the past two years has just been made, according to advices received here. Some months ago, representatives of the Rio Tinto Copper Company, of Cleveland, Ohio, visited the properties of the Savanna Copper Company, which include practically all the mines of the Pinos Altos mining district, situated nine miles north of this city.

New York, July 28.—The quarterly statement of the United States Steel Corporation for the three months ending June 30, shows total earnings of $40,170,960, an amount far in excess of unofficial estimates, and greater than the earnings of the first quarter by $3,554,084. The net earnings for the quarter were $33,880,755, or $2,377,561 greater than the first quarter's returns. Both gross and net earnings are vastly larger than those of the corresponding quarter last year, which were $29,340,421 and $23,323,395 respectively.

Tonopah, Nev.—The periodical reports of the Tonopah Belmont management are borne out by the statement of production during June. The report shows that 1,236 tons of dry ore went to the smelter and 6,157 tons to the mill. The total value of the output is placed at $276,434.54, and the net profit at $151,765.82. The statement shows that the general grade of the ore is the richest being mined in the Tonopah district, and places the Belmont at the head of the list as a producer of rich ore. Added to this is the fact that the vein producing this grade of ore is the strongest in the district, having been proven up for nearly 700 feet on its strike and 400 feet on its dip, showing an average width of 15 feet. While a little stoping has been done, by far the greater portion of the ore has come from development work.

NORWAY.

Advice has been received from the Sulitelma Company's mines in Norway that for the month of June 750 tons of concentrates, containing 6.88 per cent. copper were produced by the Elmore process.

GERMANY.

Berlin.—The "Lokalanzeiger" states that an Anglo-Dutch financial group is about to acquire control of a number of Rumanian petroleum undertakings in which German capital is largely interested. According to the journal, this means that German capitalists have decided to abandon the predominant position hitherto held by them in the Rumanian petroleum industry. German interests in the industry are chiefly represented by the Deutscho Bank and other leading banks which have 140,000,000 francs invested in Rumanian oil concerns.

AUSTRALIA.

Sydney.—The value of the mineral exports for the half-year ending June was: Silver, £75,252; silver-lead concentrates, £717,518; lead in matte, £118,403; copper, £469,096; tin, £165,025, and coal, £948,472. The total increase as compared with the corresponding period of 1909 amounted to £203,472.

SOUTH AFRICA.

A cablegram from Johannesburg states that during June the mines of the Witwatersrand (that is, excluding outside mines) crushed 1,761,034 tons. The average yield per ton was 28s 1d, the working costs per ton were 17s 9d, while the profit per ton was 10s 5d, and the aggregate profit £921,136.

Johannesburg.—The June output was a record of daily production, while the daily profit was the highest obtained this year, with the exception of February. The amalgamation of the Cloverfield and Welgedacht properties, under Mr. Abe Bailey's auspices, has been agreed to in principle. There is a possibility that the Lace Proprietary Company's Droogefontein farm and the Geygerle will be included.

The Van Dyk quarterly report shows that out of 875 samples assayed, 210 gave 7½ dwts. over 30 ins.; 665 gave below 5 dwts.

Johannesburg, July 21.—A gassing disaster, due to the ignition of a case of gelatine, occurred to-day at the Simmer East Deep mine. Thirteen whites were taken to hospital suffering from the effects of the gas, while fifteen natives lost their lives and 76 were conveyed to hospital in a more or less serious condition.

COMPANY NOTES.

CROW'S NEST DIVIDEND.

Crow's Nest Coal directors have declared a dividend of 1 per cent., payable August 10th to shareholders of record August 5th. The declaration is not a period dividend, but is merely a distribution, though the company's position is said to be steadily improving, and regular dividends may be settled on in the near future. The Crow's Nest Pass Coal Company ceased paying dividends two years ago, such policy being decided on to meet losses through the Fernie fire, and also to furnish funds for development work and improvements.

Another dividend of 300 per cent. has been declared by Temiskaming & Hudson Bay mine, payable July 29th. They have already paid 900 per cent., so far this year, which amounted to $69,849. This dividend will make a total of 1,200 per cent. for the year, or $93,122. The Liskeard company easily lead the list of dividend paying mines in percentage. In the year 1909 they declared a total of 2,400 per cent.; in 1908, 3,500 per cent.; in 1907, 300 per cent.; in 1906, 9,000 per cent., making a total of 16,300 per cent., valued at $1,285,946. This remarkable record can scarcely be equalled anywhere in the world.

An extra dividend of 3 per cent., or $30,000, has been declared by the Buffalo Mines, payable on all outstanding stock on August 15th, 1910.

Already this year the Buffalo has paid 19 per cent., or $160,000, in dividends, so that their yearly total now reads 19 per cent., or $190,000. The total to date since the organization of the company is 84 per cent., or $777,000.

STATISTICS AND RETURNS

Granby, during the week ended July 30th, sent out 20,721 tons, making 713,823 tons for the year to date.

The output of pig iron in the United States during July was heavily curtailed, preliminary returns indicating a reduction of about 140,000 tons, or a total of 2,125,000 tons during the month, which is at the rate of 25,500,000 tons annually of anthracite and coke iron. Estimating charcoal output at 400,000 tons, they are now producing pig iron of all kinds at the rate of about 25,900,000 tons, while during June the output was at the rate of 27,300,000 tons annually, including charcoal iron.

COBALT ORE SHIPMENTS.

The following are the shipments from the Cobalt camp for the week ending July 29th, and those from January 1st, 1910, to date:

	August 5. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	.....	180,617
Buffalo	59,000	1,304,468
City of Cobalt	.....	422,735
Chambers-Ferland	.....	1,024,600
Cobalt Central	.....	293,286
Cobalt Lake	.....	260,900
Cobalt Townsite	.....	116,860
Colonial	.....	148,900
Coniagas	72,990	999,046
Crown Reserve	211,232	4,132,020
Drummond	.....	664,200
Hargraves	60,000	281,170
Hudson Bay	.....	297,835
Kerr Lake	60,129	5,984,587
King Edward	.....	221,296
La Rose	309,600	7,561,441
McKinley-Darragh	103,990	2,094,429
Nipissing	129,360	6,792,777
O'Brien	.....	758,086
Peterson Lake	.....	432,420
Provincial	.....	65,000
Right-of-Way	122,570	1,080,217
Silver Cliff	52,780	212,770
Temiskaming	53,000	1,248,050
Trethewey	41,300	682,410
Waldman	.....	63,992
Wyandoh	.....	48,300
Standard Cobalt	63,992	147,992
Rochester	60,750	60,750

Ore shipments for the week ending August 5th were 1,401,593 lbs., or 700 tons.

Total shipments from January 1st to August 5th were 37,582,154 lbs., or 18,791 tons.

Following are the shipments from the Cobalt camp for the week ending July 29th, and those from January 1st to date:

	July 29th. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	.....	180,617
Buffalo	61,790	1,245,468
City of Cobalt	.....	422,735
Chambers-Ferland	64,000	1,024,600
Cobalt Central	.....	293,286
Cobalt Lake	.....	260,900
Cobalt Townsite	.....	116,860
Colonial	.....	148,900
Coniagas	.....	926,056
Crown Reserve	126,330	3,920,888
Drummond	.....	664,200
Hargraves	.....	221,170
Hudson Bay	.....	297,835
Kerr Lake	44,500	3,924,458
King Edward	.....	221,296
La Rose	325,900	7,251,841
McKinley-Darragh	119,750	1,990,439
Nipissing	184,550	6,663,417
O'Brien	.....	758,086
Peterson Lake	.....	432,420
Provincial	.....	65,000
Right-of-Way	.....	957,647
Silver Cliff	.....	159,990
Temiskaming	192,480	1,195,050
Trethewey	.....	641,110
Waldman	.....	63,992
Wyandoh	.....	48,300
Standard Cobalt	84,000	84,000

Ore shipments for the week ending July 29th were 1,203,300 lbs., or 601 tons.

Total shipments from January 1st to July 29th were 36,180,561 lbs., or 18,090 tons.

BRITISH COLUMBIA ORE SHIPMENTS.

The mining returns for the week ending July 30th are unusually interesting from the fact that the Boundary passes the 1,000,000 mark in tonnage produced the current year, and from the fact that the British Columbia Copper Company has treated at its Greenwood smelter to date 200,000 tons of ore.

The returns of the ore production and movement for the week and for the year, are as follows:

Boundary Shipments.		
Granby	20,721	712,703
Mother Lode	6,800	189,905
Snowshoe	2,438	96,807
Oro Denoro	289	7,645
Jack Pot	697	4,002
Other mines		608
Total	30,945	1,011,670
Rossland Shipments.		
Centre Star	3,131	113,922
Le Roi No. 2	634	19,273
Le Roi No. 2, milled	300	9,000
Le Roi	506	9,381
Velvet	31	286
Other mines		177
Total	4,602	152,039
Slocan-Kootenay Shipments.		
St. Eugene, milled	2,775	83,250
Van Roi, milled	800	24,000
Whitewater, milled	250	6,250
Queen, milled	420	12,600
Granite-Poorman, milled	250	7,500
Nugget, milled	110	3,300
Richmond-Eureka	31	2,539
Emerald	29	1,126
Yankee Girl	129	3,250
Eastmont	35	485
Sullivan	288	7,640
Queen Victoria	138	2,046
Other mines		27,319
Total	5,255	181,305

The total shipments for the week, including the estimated milling, were 40,802 tons, and for the year to date, 1,345,014 tons.

B. C. Copper Company's Receipts.
Greenwood, B.C.

Mother Lode	6,800	189,905

MEN OF WEALTH

Are almost invariably the greatest believers in Life Insurance because they recognize the value of a "Cash" estate absolutely secured, and therefore they aim to maintain a considerable portion of their estate in the form of Life Insurance.

The North American Life Assurance Company appeals to business men because of its long record of success and its able and progressive management.

Assets, over $10,500,000. Net Surplus, over $1,000,000. Good Agency openings for energetic men.

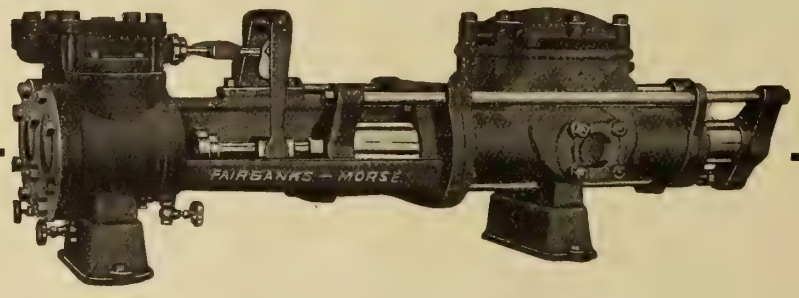
A Revelation

THE CFCo LTD

We firmly believe that the Economy effected in Steam Consumption and the Steady, Reliable Service given by Fairbanks-Morse Steam Pumps will prove a revelation to most engineers.

The design is fundamentally correct, as the pump relieves itself without setting up internal strains. There is an entire absence of short stroking, straining, or blowing out of valves so noticeable in some pumps when working under heavy load.



We build Fairbanks-Morse Pumps for Steam, Electric or Belt Power. Also Underwriters' Pumps.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price,

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE FOLLOWING GEOLOGICAL MAPS HAVE BEEN RECENTLY ISSUED:—

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1025. Waverley Sheet. Scale 1 mile to 1 inch.
1037. Windsor Sheet. Scale 1 mile to 1 inch.

QUEBEC

1079. Geological and Topographical Map of St. Bruno Mountain, Chambly Co., Que. Scale 800 ft. to 1 inch.

ONTARIO

1076. Gowganda Mining Division. Scale 1 mile to 1 inch.
1061. Explored routes in a portion of North Western Ontario, traversed by the National Transcontinental railway between Lake Minnitaki and Lake of the Woods. Scale 4 miles to 1 inch.

ALBERTA

1032. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland. Scale 400 feet to 1 inch.
1004. Geological Sheet, Rossland Mining District. Scale 1200 feet to 1 inch.
1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1105. Map No. 4A. Geological—Golden Zone Mining Camp near Hedley, B.C., by C. Camsell. Scale 600 feet to 1 inch.
1106. Map No. 3A, Geological—Mining Claims on Henry Creek near Hedley, B.C., by C. Camsell. Scale 800 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1041. Geological Map Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of the ore bodies of the same belt.
1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.
973. Catalogue of Canadian Birds, by John Macoun and James M. Macoun.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotland Part I, Economics, Part II Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

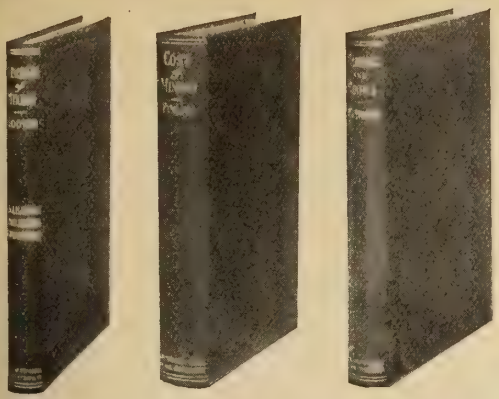
ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon and Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
980. Report on a portion of Algoma and Thunder Bay Districts, by W. J. Wilson, and on the region lying north of Lake Superior between the Pie and the Nipigon Rivers, by W. H. Collins. A map showing the geology along the water courses from Lake Superior to the Albany River and from Missinabi to Nipigon River accompanies the report.
1075. Report on the Gowganda Mining Division 1908, accompanied by a map, by W. H. Collins.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.

YUKON and NORTH WEST TERRITORIES



1050. Whitehorse Copper Belt, accompanied by maps, by R. G. McConnell.
1097. A Reconnaissance across the McKenzie Mountains on the Pelly, Ross and Gravel Rivers, Yukon and North West Territories, with map, by Joseph Keele.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Book Dept. CANADIAN MINING JOURNAL, *Confederation Life Building* TORONTO

Geology Applied to Mining

By Josiah Edward Spurr, A.M.

Mining men, prospectors, investors and students have found this book a treasure house. It is a plain, simple, straightforward application of economic geology to mining problems. It is a concise summary of the principles of ore deposits for the man who wishes to exploit them. It isn't *geology*, but *geology* as *applied to practical mining.* It boils down the abstract science for the practical mining man and student—the processes of deposits, the arrangement of stratified rocks, igneous rocks, structures, placers, chemical geology, etc., etc.

Library edition, cloth, $1.50 net, postpaid

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mir es. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

Prospecting, Locating and Valuing Mines

By R. H. Stretch, E. M.

Not only prospectors but all investors in mining properties should own this book. It is a safe guide and an invaluable reference work. It is the *standard*. Ten thousand copies have been sold. It is full of facts and data. It tells you all about

Mines—and mistakes in mining.
Mineral Deposits and Veins and how to detect them.
Locations and Patents.
Preliminary Development of Mines.
Discussions of Various Minerals.
Useful Tables and Diagrams.

Cloth, Library edition, $2.00 net, postpaid
Leather, pocket size, $2.50 " "

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,03 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land ha been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in th Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed b Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

Westinghouse Motor-Generators

Westinghouse Standard Motor-Generators are built for both 25 cycle and 60 cycle circuits, in sizes up to and including 2,000 kilowatts, utilizing either synchronous or induction motors. Synchronous motor-generators are arranged for self-starting from the alternating-current end, and all sets may be started from the direct-current end.

In general, Westinghouse Motor-Generators may be used without step-down transformers on alternating-current voltages up to 6,600 volts. Direct-current voltages are 250 and 600 volts.

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

DOBLE WATER WHEELS

In successful operation under heads from 25 ft. up to 2,200 ft. and in capacities up to 9,000 H. P. from a single jet and runner. With patented regulating needle nozzles and ellipsoidal buckets embodying the following notable advantages:—

HIGHEST EFFICIENCY
CLOSEST REGULATION
STRICTEST ECONOMY

We illustrated in the last issue Doble Wheels ranging from 100 H. P. to 237 H. P. under heads varying from 110 ft. to 620 ft. We illustrate to-day a

10,500 H. P. DOBLE WHEEL

Under construction in our shops, Montreal, for the B. C. Electric Railway. It was designed to deliver 10,500 H. P. at 200 R. P. M. under a head of 380 ft. There are four sets of buckets, all on the same shaft, two on each side of a 5,000 K. V. A. alternating current generator.

"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just becanse it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be the stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we know, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs per year than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line, As you have everything to gain and nothing to lose, why not investigate NOW?

Amatite ROOFING

NEEDS NO PAINTING

MOST ready roofings require special painting and coating, and unless this is done regularly, you are sure to have leaks and trouble right along.

If you use Amatite, nothing of the sort is required. You will have real roof protection *without painting* of any kind.

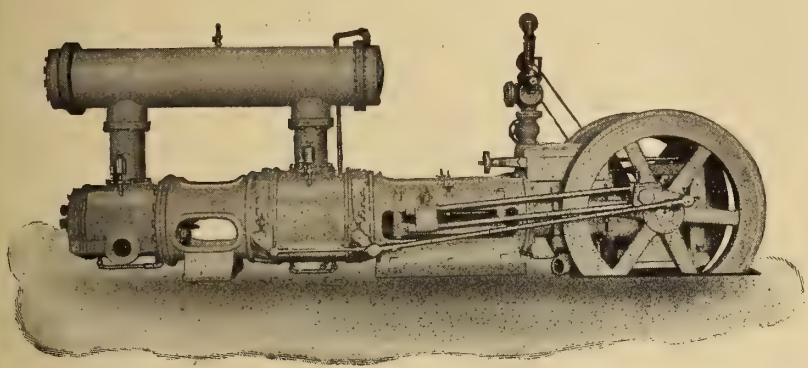
Amatite is made to stay waterproof and give protection year after year, without any thought or care on your part.

First—Because it is waterproofed with Coal Tar Pitch.

Second—Because it has a real Mineral Surface.

Amatite, owing to these features, is the most economical roofing made. Its first cost is low, and you are *saved* all future expense for repairs or paint because it will need neither.

If you haven't seen Amatite, write for a sample to-day. From it you will very quickly understand why it doesn't require painting; why it does not leak; and why it saves you money.



Address nearest office to-day.

THE

MINING MANUAL

1910

BY WALTER R. SKINNER.

The Standard Reference Work on Mines.

Price 17/- net Post Free (Abroad).

1,600 pages. In demy 8vo, handsomely bound in RED cloth.
A record of information concerning

MINING COMPANIES
(Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, Exploration and Mining Investment Concerns, &c.)

Arranged in three sections—

Australasian, African, Miscellaneous,

Preceded by Tables of Crushings and followed by lists of Mining

DIRECTORS, SECRETARIES, MINING and CONSULTING ENGINEERS and MINE MANAGERS.

Their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected, and a

DICTIONARY OF MINING AND OTHER TERMS.

THE MINING MANUAL for 1910 contains particulars of over 3,600 Companies arranged in three sections, 430 Companies being AUSTRALASIAN (including Western Australia, Queensland, Broken Hill, Deep Leads, New Zealand and Tasmania); 1,030 AFRICAN (including Transvaal, Rhodesia ,West Africa, Cape Colony, Natal, Egypt); and 2,140 MISCELLANEOUS (including Siberia, Mexico, India, British Columbia, America, &c., and the Coal, Iron, Tin and other Mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; plant erected or in course of erection; present working results; ore reverses; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts. Highest and lowest prices of the shares for the last four years, also latest price. The three sections extend over 1,100 pages,

Crushing tables and Gold Outputs from the principal mines are given at the commencement of the volume, showing tons treated monthly, results obtained, and yield per ton; also annual yields.

The Lists of Directors (8,000), Secretaries (1,900, Mining and Consulting Engineers and Mine Managers (1,400) include their addresses and descriptions and names of the Companies with which they are connected.

A complete Alphabetical Index, containing the names of 5,300 Companies and including many useful items of reference, occupies 42 pages.

Full particulars of all Re-constructions, Re-organisations and Amalgamations durlng 1909 are given in a simple and concise form.

CYANIDE HANDBOOK BY J. E. Clennell

Over 500 pages, 6x9, illustrated, $5.00 (21s) net, postpaid

Mr. Clennell has been in close touch with the rapid developments of cyaniding. He has been instrumental, too, in many important discoveries, and his work in this field has taken him to the leading plants of the world. It deals generally with Cyanide and does not confine itself to the process alone. It is divided into nine main parts covering the subject more fully and exactly than it has heretofore been handled.

Especially noteworthy is the full treatment of recent developments and important phases heretofore *inadequately treated.*

Book Department CANADIAN MINING JOURNAL

Handling Coal Economically

Jeffrey Conveyers are constructed throughout to withstand hard service. They are moderate in first cost and require less for up-keep than any other conveyers built.

Our 33 years experience in the design and manufacture of conveying machinery enables us to produce the most economical and dependable equipments for handling any materials.

Let our expert engineers study your coal handling problem and suggest the best system for your requirements.

Catalogue X 81, describing various styles of Jeffrey Conveyers, is yours for the asking.

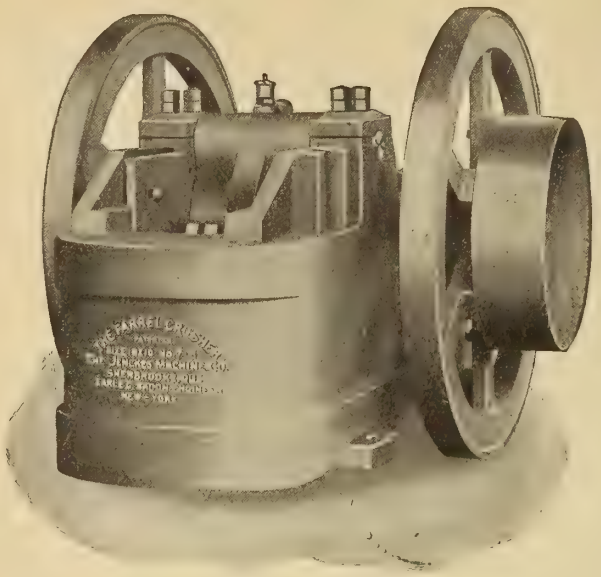
REPAIRS To Surveying Instruments

WE have established in MONTREAL a **Repair Department,** fully equipped to repair surveying instruments, drawing instruments, measuring tapes, etc., in the most careful and workmanlike manner.

We employ in this department mechanics trained at our works, experienced in the repair of a wide variety of instruments of every make, and we can assure our customers that any repair work entrusted to our care will be promptly and satisfactorily executed.

KEUFFEL & ESSER CO.



MONTREAL, 252 Notre Dame St. W.

General Office and Factories, HOBOKEN, N.J.

New York, Chicago, St. Louis, San Francisco

Mathematical and Surveying Instruments

Drawing Materials **Measuring Tapes**

The Farrel Bacon Crusher

STYLE "B"

Will crush the hardest rock quicker and at less cost than is possible with any other.

Wearing parts such as Jaw Plates and Toggle Seats can be easily renewed even in the largest crushers without dismantling the machine, these parts are not expensive and can be put in place with practically no loss of time.

Catalogue No. 603 sent on request.

PEAT.

Self-appreciation is a virtue which we attempt to encourage in ourselves. Yet we feel that it can be overdone in others.

For more than two years the CANADIAN MINING JOURNAL pressed upon the attention of the Federal Mines Branch several pertinent matters. Chief amongst these were the investigation and control of explosives, the encouragement of mine rescue work, and investigation of mine accidents. Within the last few months the Mines Branch has diverted its energies to these subjects. It has made a fair beginning in that it has stimulated public interest. But, quite naturally, any efforts it can put forth must but feebly compare with the requirements of the case until such time as an effective addition be made to its present staff. In thus alluding to matters already worn threadbare, one object is to correct what we consider a very serious mistake in the policy of the Mines Branch. The organization has got on the right track in the matters mentioned above. Life saving, whether indirectly by the prevention of accidents or directly by salvage appliances, eclipses all else in importance. It is, then, with pain that we observe that part of the staff and much of the appropriation of the Mines Branch are being used for the solution of the peat problem. Both staff and appropriation are limited, very limited indeed. This disposition of its energies may be compared to the case of the man who insisted upon finishing weeding his garden, the while his house was burning.

Further to illustrate our point let us consider the present position of Canada in regard to mining accidents. Great Britain, the leading European nations, and the United States have adopted enlightened preventive measures. We have alluded so recently to these that iteration is not necessary. The Canadian government, despite the representations of many employers and our own humble but pointed remarks, has rested upon its oars until the pressure was so great that it could not be resisted. Meanwhile many lives have been lost, and, as alluded to before, the United States authorities had to be called upon for assistance in the most distressing Extension colliery catastrophe.

Now, whilst we thoroughly approve the beginning already made, we do not hesitate to state that the Mines Branch has but two courses to pursue. Either it must secure large additions to its staff, or else it must drop its interesting, but not invaluable, work in peat and such things. Peat can wait. Human lives must not be wasted.

Lest any of our readers question the fairness of our reference to peat let us here and now survey the facts, denuded of their garb of shimmering fancy.

The use of peat for fuel is older than history. In the coalless provinces of Canada, peat, like everything else that can be burned, is of importance. The Mines Branch at Ottawa has set up a Swedish peat-making plant on a bog at Alfred, Ontario. If press despatches are to be trusted, the results obtained at Alfred go far to imperil the supremacy of Pennsylvanian coal. Indeed, Dr. Haanel is reported as saying that peat, ready to be used as fuel, can be produced at the Alfred works at a cost of $1.70 per ton. He is also credited with the statement that as much heat can be produced from a ton of peat as from a ton of coal. Both statements are fantastically inaccurate, and we shall not believe without further evidence that Dr. Haanel is responsible for them.

Much effort and a vast amount of ingenuity have been expended in the past in the attempts to make use of the extensive peat deposits of Ontario and Quebec. According to the Hon. Mr. Sifton, the failure of these endeavours has been due largely to the unscientific methods and uneconomic processes employed.

Calm consideration indicates that it is scarcely likely that all previous workers in peat have been lacking in scientific knowledge, or in their grasp of the commercial aspects of the question. Nor is it probable that the installation at Alfred of a Swedish plant of a well-known type will dispel all the difficulties that hitherto have beset the manufacture of peat fuel.

The crux of peat fuel manufacture is the removal of the moisture, of which peat is singularly tenacious. The sun and the wind are the cheapest agents, but obviously a nation's supply cannot with safety be permitted to depend upon the weather. On the other hand, if artificial heat be resorted to for driving off the water, experience has shown that the cost is increased to a point at which peat cannot command a market where coal or wood is obtainable.

It may be possible, though we doubt it, that the bare manufacture of air-dried peat can be carried on at a cost of $1.70 per ton; but it is safe to say that no peat fuel will ever be put on the market in a commercial way at any such figure. Manufacturers' profits, freight charges, cost of distribution, and middlemen's commission would bring the price up to two and a half or three times the original cost. Nor is peat a substance that bears transportation well. It crumbles and breaks, and there would be an appreciable loss on arrival at distant markets. Its fuel value, also, as compared with coal is overstated. Air-dried peat contains 12 to 15 per cent. of water at least, and its calorific power is little more than one-half that of anthracite coal. Peat fuel delivered to the consumer at, say, $4.50 per ton, would be much dearer than anthracite at $6.50 or $7.00 per ton. As long as hard coal can be obtained at present prices, there is little hope of its being displaced by peat, for the consumption of which special stoves, fireplaces and furnaces are required.

Nevertheless, the carbon that nature has stored in the peat bogs of Canada, aggregating thousands of square miles in extent, may some day be required to warm the bodies and cook the victuals of Canadians. Any real advances in the preparation of peat for fuel will be welcomed. There is nothing to lead us to believe that the Mines Branch has thrown light upon the question. Meanwhile our major point is the fact that other work has an immediate and imperious call upon the Mines Branch.

ENGINEERS AS CITIZENS.

Not long ago we were asked why the mining engineer is so indifferent to his duties and privileges as a citizen. We found that the assumption and the answer demanded a deal of excogitation.

Mining engineers, like their civil brothers, are nomadic. They live on the fringe of civilization. They work. Their work demands continuous attention. They do not touch politics. Rarely do they court the muses. When they gather in convention they talk mining. In all their spare moments they talk mining. To them the rest of life is shadowy and unsubstantial.

How many mining engineers are in the House of Commons, or in our provincial legislatures? How many are prominent in the business world, or in letters, or in sports, or in anything but mining? How often do we see the mining engineer rising to high administrative positions?

We can see two handicaps under which the mining engineer labours. The more definite of these is his ignorance of office methods and of business training. For example, an operator informed us recently that he had employed a second-year student of mining as timekeeper. Here we cannot quote our informant verbatim. He was not quotable. But it appears that the second-year student was incapable alike of making his extensions correctly, and of adding up his totals. It took thirty-six hours of hard labour to correct that young man's mistakes. Yet in all probability the youth was possessed of ordinary ability. Who is to blame?

The second handicap is less definite, but none the less serious. The mental development of the mere specialist is not symmetrical. His mind is like a hammer with a broken handle. It works, but its range is sadly limited. The mining engineer, who is merely the mining engineer, is far from reaching the full development of his mentality. His vision is narrow, and, in matters not pertaining to his profession, blurred and oblique. The very nature of his work demands that he cultivate the humanities.

Of all enlightening influences good books are the best. Good books are not hard to get. They take a man out of himself. They quicken and broaden and refresh the reader. They are not luxuries, they are absolute necessaries . . . .

Later we hope to have more to say on this topic. Our immediate object is to point out that the lack of roundness in the mining engineer's education is the main cause of his obscure position as a citizen. Mining en-

gineers as a class are the salt of the earth. As public citizens they are almost negligible.

MINING OPERATIONS IN QUEBEC DURING 1909.

We have looked forward with keen expectation to the first Quebec annual report issued under the supervision of Mr. Denis. Our first feeling on receiving an execrably printed 32-page pamphlet was one of disappointment. We had hoped that the new regime in Quebec would have been signalized by a report as ample and as dignified as are those issued by other provinces. No doubt the new Superintendent of Mines has had his hands more than full. He has occupied the office for but a few months. In many directions he has re-vivified the Department of Mines and, certainly, he has inspired the provincial government to better things. These considerations induce us to overlook the slimness of the report. But the cheapness of the paper, the wretchedness of the printing, and the unutterableness of the half-tones cause us to cry aloud and spare not. The province and the Department should be thoroughly ashamed of themselves.

It is encouraging to note that the mineral production during 1909 was the highest so far recorded. The figures for 1909 are $5,552,062, whilst for the year before they were $5,458,998, an increase of $93,064. Owing to changes made in the method of gathering statistics it is probable that the increase was still larger.

The principal gains during the year were in the outputs of copper ore, cement, marble and limestone; while the chief items of loss were in bog iron ore, chrome iron ore, asbestos, mica, granite and tiles.

Since 1900 the yearly mineral production has more than doubled itself. Although the figures are still far too small, yet there appear to be healthy symptoms of growth. One strong factor in that growth is the honest endeavour of the Quebec Government to re-model the mining laws. The recent changes have been fully noticed in these columns. We need only note here the fact that Quebec has eschewed that bugbear of the prospector, "discovery."

Mr. Denis briefly reviews the status during the year of each mineral industry. An abstract of his report appears on another page. Mr. J. H. Valiquette, Assistant Inspector of Mines, contributes an analytical review of all mining accidents occurring throughout the year. To this he appends timely warnings as to the use and storage of explosives.

In the main, Quebec has every cause to look forward with confidence. Her time is coming, and coming rapidly. It will come even more rapidly when the Department is able to publish a report compatible in all respects with the dignity of the province and with the requirements of the industry.

PORCUPINE.

Three errors against which it is constantly necessary to guard are over-estimation of a prospect, assuming the presence of unproved ore, and dogmatizing upon a mine's future with insufficient data. All of us are prone to sin in any or all of these ways. And, on the other hand, we are equally prone to swing to the other extreme and to assume a guardedly nescient position.

We have watched Porcupine with hope, and fear, and trembling. The latter two sensations have now practically disappeared. We have abundant evidence to believe that in certain spots bonanzas, such as we have never known in quartz mining before, have been encountered. At one young mine, for instance, spectacularly and uniformly rich ore has been sunk in continuously to a depth of 120 feet. Within a short distance, and presumably in the same body of ore, two other shafts, slightly less deep, are in similarly rich ore. Fine gold is disseminated throughout the ore from shaft-collar to sump. Drifts are being run and still the ore maintains its character. In fact, considering the amount of work done we doubt if there has ever been any such showing on the continent. Mill returns, which, naturally, are neither full nor exact, indicate that much of the ore runs well over $100 per ton. Some of it greatly exceeds this figure. The ore body ranges from six to twelve feet in width. Its horizontal extent can not be determined for some time yet.

Some other prospects are almost equally encouraging. It is inevitable that the great majority of claims staked will prove worthless. But all securable evidence points to the fact that the clouds that for so long have hung over Ontario gold mining are at last to be dispelled.

We cannot close without adding a word of congratulation. Porcupine has suffered no plague of boomsters. The "four-flusher" is there, as he is always everywhere. But he is by no means the controlling element. The men who are making Porcupine are content to mind their own business. Neither they nor we wish to see a boom in Porcupine. For once let us witness the blessed sight of a mining camp developed on its own merits.

MINE COST DATA.

It has been well remarked that the only indication obtainable by many mine operators as to costs is the condition of their bank balance. Itemized cost statements are usually made out so late that they are of little assistance. Hence arise confusion, waste and direct loss.

The Joplin Ore Producers' Association proposes to evolve a cure for this disease. A series of daily report forms has been prepared. Forty-eight mine operators are to be requested to fill out these forms daily and send them to headquarters. Here a competent staff will transfer and systematize the data. The costs will be properly distributed and analyzed. Each company will thus have the benefit of comparison with forty-seven other operating concerns. Moreover the facts thus ascertained will prove invaluable in discussing tariff problems.

The identity of no mine will be revealed in the state-

ment. Each will be numbered, and all information is to be considered confidential.

Canadian operators, especially in our large mining districts, might well follow this example. Apart from the economies that would follow, the arrangement would induce solidarity and uniformity.

A GOOD REPORT.

A word of praise is due the Government of British Columbia and Mr. W. Fleet Robertson, the head of the British Columbia Bureau of Mines, for the high character of the Annual Report. In respect of statistical tabulations, in typography, in illustrations, in descriptive matter, the Annual Report leads all Canada.

The full special reports upon the Extension explosion are of vital interest. The Government is no longer indifferent to the unnecessary loss of life in coal mines. It has been resolved that the situation will be met at once. Other provinces are rousing themselves. The honour of leading will rest with British Columbia.

EDITORIAL NOTES.

God save the King! Mr. Julian Hawthorne has turned loose his turbid tide of titillation on poor old England. Except as inspiration for Hawthorne's pellucid prose, shares in Hawthorne silver and iron mines, are worth about as much as Confederate paper money.

We hope that the Canadian Mining Institute will make arrangements to reprint Mr. H. Mortimer-Lamb's exceedingly careful paper on the mineral industries of Canada. Mr. Lamb's paper was read in Germany before the International Mining Congress. It is a difficult matter to treat so vast a subject without becoming either too diffuse or congestingly succinct. Mr. Mortimer-Lamb's paper shows that he has evaporated off the non-essentials without volatilizing anything of value. In plain speech, he has written a good, readable, and accurate paper.

The recently issued map of the Porcupine gold area, districts of Sudbury and Nipissing, Ontario, is a careful and instructive compilation. Messrs. A. G. Burrows and W. R. Rogers, respectively geologist and topographer, are to be congratulated. The conditions under which they worked were difficult. The marginal notes from Dr. W. G. Miller's pen are instructive. With his usual discrimination Dr. Miller steers a safe course. He writes no phrase that can be warped by the "boomster." There may be, however, superfluous canniness in one sentence. "Of course," writes Dr. Miller, "experienced gold mining men will not lay too much stress on surface values." In itself this statement is perfectly true; but taken with the context it may easily suggest to the hyper-sensitive Porcupinian that Dr. Miller does not look favourably upon the gold deposits in question. However, we can always count upon fault-finding.

Northern Ontario is manifesting its intention of taking care of itself. This is evident particularly in the case of Cochrane where a bright and independent weekly newspaper, "The Northland," is now being published. "The Northland" speaks with decision and clearness on public questions. It deserves the support of the community.

Amongst the reports in the Annual Summary of the Mines Branch, Ottawa, are some notes by Dr. Alfred, W. G. Wilson. In reviewing the pulpwood situation, Dr. Wilson remarks that if a portion of the copper-sulphur ores of Quebec can be utilized at the point of production for the manufacture of pulp, the mine owners will not be the only persons benefitted.

THE PROSPECTOR.

The accompanying photogravure represents a plaster cast designed by Mr. P. Norman Nissen. The engraving by no means does justice to the figure. However, our readers will notice with appreciation the poise of the prospector. On his face, marred indeed by the photograph, is a look of whimsical endurance. He has struck his stride. He carries a heavy pack. Evidently his tump-line has gone the way of all flesh and he has resorted to a piece of rope. In detail the figure may be open to criticism; in general effect it is strong and full of meaning and life.

The prospector is not always an heroic figure. The short, wiry, tough bushman is not frequently a thing of beauty. Mr. Nissen has got nearer the truth than most artists can.

It is fair to mention that Mr. Nissen dabbles in art only on rare occasions. He is, as many Canadians know already, a mining man himself and is not without painful experience in prospecting.

REPORT OF MINING OPERATIONS IN THE PROVINCE OF QUEBEC DURING THE YEAR 1909.

Abstract of Report of Supt. of Mines, Theo. C. Denis.

The mineral production in the Province of Quebec during the year ending December 31st, 1909, amounted to $5,552,062. This is a slight increase over the figures for the previous year which were $5,458,998. Thus in 1909 we had the highest mineral production recorded so far.

It should, however, be noted that the aggregate amount for the two years cannot be fully compared with one another owing to the changes made in the method of gathering statistics of certain non-metallic substances such as building stone, lime, bricks, etc. It is very difficult to obtain complete data regarding the production of these materials and, in previous years, the Bureau of Mines had adopted the rule of taking the figures given by the Census Bureau. These figures are given only at long intervals and meanwhile the same figures were repeated from year to year.

We attempted to get the figures for 1909 by applying directly to quarry workers, lime-burners and owners of brick-yards.

This entailed considerable extra work because it was necessary to correspond with an additional number of several hundred operators. Our efforts have been successful and the results most encouraging. In the case of nearly every kind of building material the figures collected have been higher than those given for last year. It is true that they are still far from complete, but they have the advantage of being based upon direct reports.

The following table gives the mining statistics of the Province of Quebec for the year 1909. For purposes of comparison, we have added a column showing the value of the various mineral substances produced in 1908.

Products.	Wages paid to workmen	Number of work men	Quantities	Value	Value in 1908
	$		tons	$	$
Bog iron ore ...	3,082	50	3,300	4,688	30,957
Ochres	16,388	65	3,940	28,093	19,940
Chrome iron ...	20,000	60	2,470	26,604	83,740
Copper ore	69,984	175	35,100	215,580	159,588
Asbestos)			63,965	2,296,584	
)	1,349,864	3,008			2,551,596
Asbestic)			24,801	20,468	
Mica	35.884	176	.....	27,034	95,311
Phosphate	.....	.....	525	4,800	1,610
Graphite	11,866	39	.....	10,339	165
			Galls.		
Mineral waters .	1,260	5	32,537	17,246	.....
			Sq.		
Slate	10,828	30	4,000	24,000	20,056
			barrels		
Cement	125,000	30	1,011,194	1,314,551	1,127,335
			tons		
Magnesite	954	6	330	2,508	520
Marble	70,000	125	.....	130,000	
Flag stones ...	2,225	10	.....	8,500	3,600
Granite	122,780	268	.....	149,064	250,000
Lime	42,504	99	.....	105,489	96,000
Limestone	241,269	699	.....	457,143	223,580
Bricks	205,764	853	M.93,891	584,371	525,000
Tiles, drain tiles, pottery, etc. . (partly estimated)	.....	.....	.....	125,000	270,000
				$5,552,062	$5,458,998

We give below a table showing the value of the yearly mineral production of the Province of Quebec since 1900. It will be seen that in ten years the figures have more than doubled and it may be presumed that this increase will continue in the future.

Year.	Value.
1900....	$2,546,076
1901....	2,997,731
1902....	2,985,463
1903....	2,772,762
1904....	3,023,568
1905....	3,750,300
1906....	5,019,932
1907....	5,391,368
1908....	5,458,998
1909....	5,552,062

Mining Law.

During the session of 1909, the Legislative Assembly of the Province of Quebec enacted some amendments to the Quebec mining law. The changes are important and we deem it advisable to give a summary of the principles. As to details regarding the steps to be followed in order to conform to them, they are given in the text of the Mining Law of the Province of Quebec and in a small pamphlet entitled: "The Miner's Guide," which may be obtained on application to the Bureau of Mines, Quebec.

Under the new provisions, a miner's certificate must be taken out which is valid from the date of its issue to the 1st January following. The price of the certificate is $10.00.

Any holder of a miner's certificate may prospect on public lands, whether surveyed or not, or on private lands where the mines are reserved to the Crown.

Nevertheless, if such holder of a miner's certificate wishes to prospect on private lands, he must first give good and sufficient security, subject to the Minister's approval, for any damage he may cause the surface owner through his prospecting.

Every holder of a certificate has the right to mark out himself, on the ground in unsurveyed territories, one or more claims, but not exceeding five, of rectangular shape, the sides running north and south and east and west, each claim measuring at least forty acres in area and not exceeding two hundred acres in all.

In surveyed territories the holder of a miner's certificate may stake out only one or two claims, each of one hundred acres, or of the dimensions of one lot.

The holder of a miner's certificate, who has established a claim by proceeding as above, must without delay notify the same to the Department of Colonization, Mines and Fisheries or the official at the office nearest to the place of discovery.

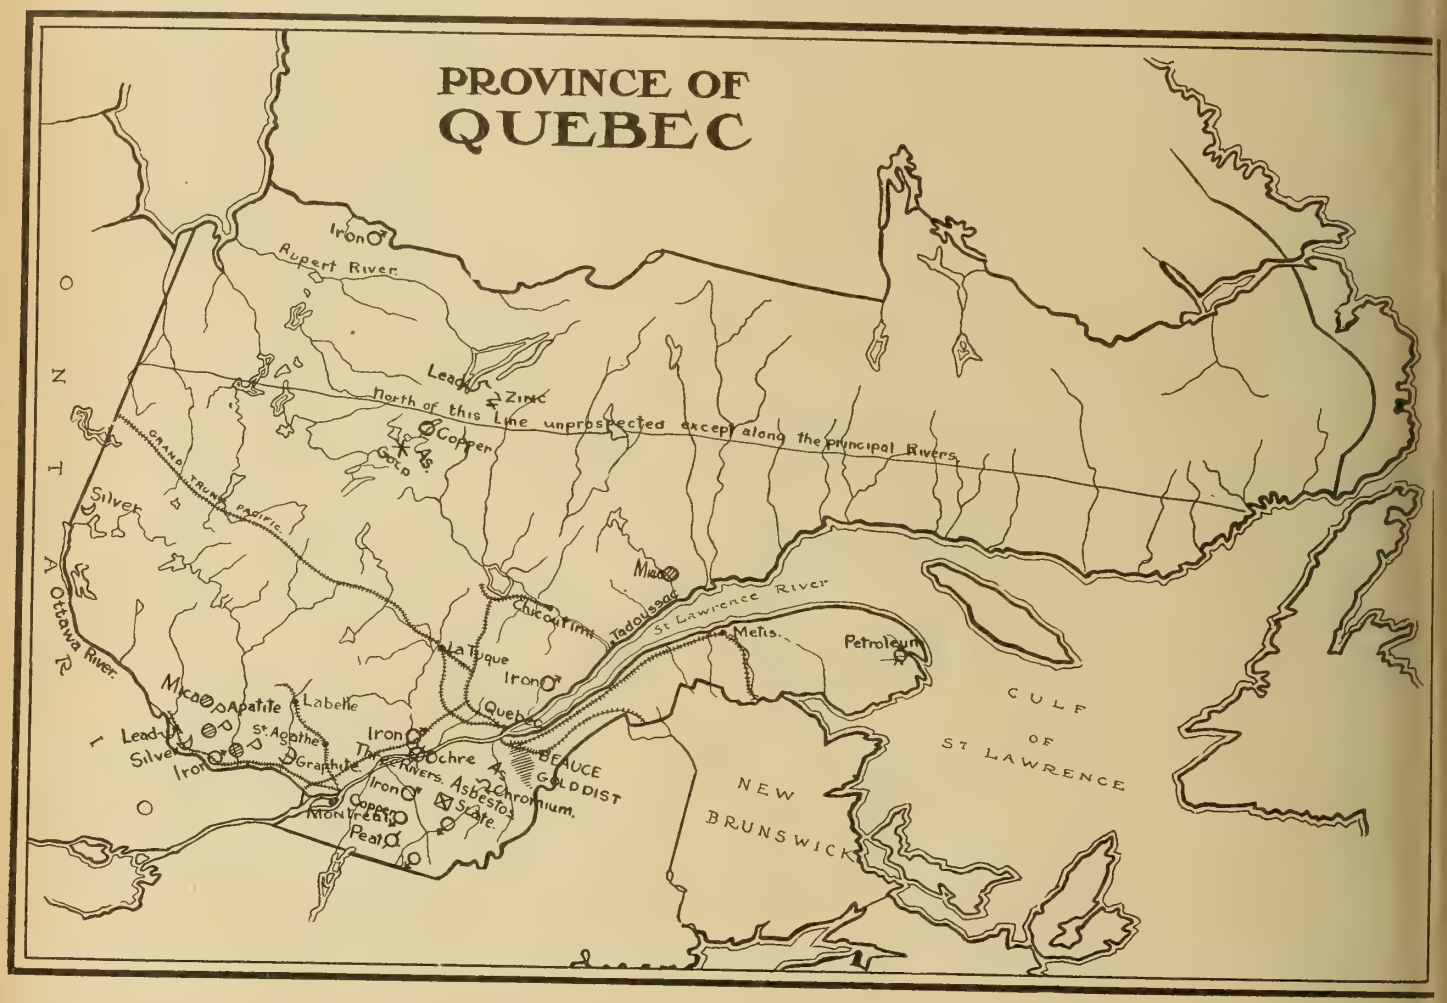
Within a delay of four months from the date marked on the stakes planted on the claim, he must, on pain of forfeiture of all his rights, obtain a mining license valid for one year and renewable. Such license is granted on payment of a fee of ten dollars and a yearly rental of one dollar per acre.

Or, if the holder of the certificate prefers to purchase the claim, he may do so by paying ten dollars per acre for superior metals when the lands are more than twenty miles from a railway and twenty dollars when such distance is under twenty miles. But letters-patent, giving full possession of such mining lands, are not issued

until the purchaser has exhibited specimens of the ore taken from it, accompanied by affidavits by competent and trustworthy persons establishing that the specimens exhibited come from such lands and that he has spent, within maximum delay of two years, the sum of five hundred dollars in mining operations.

The steps to be taken to conform to the Mining Law are set forth in a pamphlet entitled: "The Miner's Guide," copies of which can be obtained free of charge by applying to the Department of Colonization, Mines and Fisheries, Quebec.

Iron.



The Canada Iron Corporation, Limited, is the only siderurgical company operating in the Province of Quebec. That company has two blast furnaces at Drummondville and one at Radnor Forges, where charcoal pig iron is produced.

The whole of the ochre came from deposits in the vicinity of Three Rivers which have been worked for a long time. A portion of these ochres is calcined and used in making mineral paints, and the remainder in purifying lighting gas. Shipments of calcined ochre amounted in 1909 to 1,940 tons valued at $25,093, while the gas companies took 2,000 tons valued at $3,000.

The ochre deposits of that region cover large areas. One of the latter, at St. Malo, has been followed for a length of several miles, its width is from 300 to 600 feet and its depth varies between one and twenty feet.

Chrome.

During the year only 2,470 tons, valued at $26,604, were shipped. This is a marked decrease as compared with the previous year. The operators say they have considerable quantities of chrome iron ore in stock.

The iron industry has not been very active in 1909. The furnace of Radnor Forges alone was in blast, but it consumed only 3,300 tons of native ore. The chief source of supply is Ontario ore.

The following table contains a statement of the raw material used at Radnor Forges:

Imported ore	Tons,	10,256
Native bog iron ore	Tons,	3,300
Charcoal	Bushels,	641,742
Pig iron produced	Tons,	4,750

Ochres.

Our production of ochre in 1908 amounted to 3,940 tons, valued by the operators at $28,093 at shipping points.

A new company has taken over the plant and properties of the Thetford Chrome Company, lot 16, range A, Coleraine. That company is the Chrome & Asbestos Mines, Limited, which began working in June, 1909. Although there has been no production this year, preparations were being made for operations on a large scale in 1910. The whole of the concentrating works were being remodelled and twenty-five dry concentrating machines, of the Behrend system, were being put in.

It is intended to effect the concentration by crushing the ore in two jaw-crushers. It then passes into a dryer, then through rollers which crush it so that it may pass through a screen of 20 meshes to the inch. It is

afterwards sized by screens, and concentrated by Behrend dry concentrators.

Copper.

We have received returns of production of copper from only one company which works the Eustis mine.

The Albert Copper Company which owns the Albert mine at Capelton, lot 8, range 9, of the township of Ascot, did no work in 1909.

Mr. A. O. Norton, who has for some years carried on development work on a small scale at his mine on lots 2 and 3, range 11, township of Ascot, has continued to develop it, but has not yet shipped any ore.

Mr. J. McDonald, of Sherbrooke, has given an option on his property in Weedon, lot 22, range 2, Weedon Township, to a New York syndicate. A small development plant has been put up and the work of prospecting has been actively pushed. The shaft is one hundred feet deep and about one hundred feet of prospecting drifts have been run.

Some prospecting work was also done on copper deposits in the first range of St. Joseph, Beauce County.

The copper deposits of the Eastern Townships have already been the object of much study and working. One of the most recent reports dealing with the subject is that by M. John A. Dresser, entitled: "Report on the Copper Deposits in the Eastern Townships, Province of Quebec," published by the Geological Survey of Ottawa.

The most important deposits are generally in lenticular form. The average ore is low grade, but some rich zones of very high grade are met with.

The copper industry in the Eastern Townships seems, to a certain extent, to turn in a circle. The ores are not very rich, but, on the other hand, it is probable that they exist in considerable deposits and that development and prospecting work would lead to the discovery of large quantities of ore containing from 3 to 4 per cent. of copper. Such work, however, would entail considerable expense in sinking shafts, mining drifts, diamond drill boring, etc.

Low grade copper ores should be treated near the mines, which necessitates the erection of smelters. Consequently mine owners do not venture to incur the expense of development until they are sure that they will be able to dispose of the product of their mines to smelting works close by, and, on the other hand, one can understand the hesitation of manufacturers and capitalists to build and install a smelter without first being sure of the supply of ore.

A solution of this problem would be the amalgamation of several individual copper properties in a powerful company which might, after developing the deposits, operate smelters, as in the Boundary district of British Columbia where successful operations are carried on with large quantities of ore containing less than one and a half per cent. of copper, or as in Tennessee where the ores contain less than two per cent.

During the field season of 1909, Mr. A. W. G. Wilson, of the Mines Branch of the Federal Government, made a study of the copper deposits of the Eastern Townships and his report is opportune at the present moment.

Gold and Silver.

During the first six months of the year 1909, active work was resumed in connection with the gold-bearing lands of the Eastern Townships, but we have no production to record.

The right to mine for precious metals in the seigniory of Rigaud-Vaudreuil, formerly the scene of important work on the alluvial deposits of the Gilbert and Chaudiere Rivers, has been acquired by a syndicate which intends to begin operations at once. The company formed for the purpose is incorporated under the name of "The Dominion Gold Fields of Canada" with a capital of $1,000,000. It is proposed to work with steam shovels or dredges and the technical direction of the work has been entrusted to a Californian engineer.

The Marsborough Gold Fields Company, which has gold-bearing lands in the Lake Megantic region, has not sent in a report on its operations. That company put up a small stamp mill in 1908 for the purpose of making assays of the ore taken from veins of gold-bearing quartz, but we have no information as to the results.

In the County of Pontiac several companies have done some prospecting of more or less importance. It is said that very encouraging indications of the presence of argentiferous ore have been found in the Township of Fabre. It is too early yet to give an opinion regarding the value of the discoveries made in that township which lies on the east side of Lake Temiskaming, opposite the Cobalt district, but everything leads to the belief that prospecting will be actively carried on during the year 1910.

The Pontiac and Abitibi Gold Mines Company is working in the Township of Boischatel, to the northeast of Lake Opasatica, and is stated to be putting up mills for treating gold ores; the plant was transported over a road made by the company, connecting the mine with Larder Lake, a distance of about 18 miles. The lake is crossed in summer by a steamboat to reach Larder Lake city, whence a road has been made to Boston station on the Temiskaming and Northern Ontario Railway.

We also note that the Height of Land Mining Company has carried on rather extensive prospecting in the Township of Villemontel, County of Pontiac. The ores found so far consist of molybdenite and bismuth.

Asbestos.

The chief feature of the asbestos industry in 1909 was the amalgamation of several individual operators into powerful companies with large capitalization.

We note the formation of the Amalgamated Asbestos Corporation, with a capital of $25,000,000, which absorbed the following companies:

King Asbestos Mines, Thetford Mines.
Beaver Asbestos Company, Thetford Mines.
British Canadian Asbestos Company, Black Lake.
Standard Asbestos Company, Limited, Black Lake.
Dominion Asbestos Company, Limited, Black Lake.

The Black Lake Consolidated Asbestos Company, with a capital of $5,000,000, absorbed the following:

Union Asbestos Mines, Black Lake.
Black Lake Chrome and Asbestos Company, Black Lake.
Dominion Chrome Company, Black Lake.
Imperial Asbestos Company, Black Lake.

It is stated that great advantages will result from the merging of the mining interest into these two companies. In the first place the cost of management will be greatly decreasel by being centralized. It will be easier to establish for the trade, a methodical and standard classification of the various grades of asbestos and the importance of this feature cannot be exaggerated.

In the past, there has been no recognized standard and the various qualities of the different mines did not correspond to one another, to the great confusion of

the consumer who could only judge of what he bought on seeing samples. The Amalgamated Asbestos Corporation has already taken measures towards standardizing, but some time will be needed to effect such changes, which will certainly result in advantages both to the producer and to the consumer.

The value of the total production of asbestos in Canada in 1909 is slightly below that of the previous year, but it must not be inferred from this that there has been the slightest decline in the industry. On the contrary, the decrease is rather due to the fact that some important companies have made preparations during the year to greatly increase the production of their mills in 1910, and such changes have led to periods of inactivity while the necessary changes were being made both in buildings and plant.

On the other hand, it cannot be denied that the capitalization of the two above-mentioned companies is very high and, although several of the amalgamated mines are among the best and most important in the districts of Thetford and Black Lake, the high capital will certainly militate against a rapid increase in the shares of the companies.

However, the reserves of asbestos-bearing rocks are very large. Depths of 200 feet below the surface have been reached in some quarries and, at that depth, no marked change has been noted in the percentage of asbestos in the rock extracted. There is no doubt that there is no reason to fear any diminution in quality for a long while.

We have received reports of the production of nine companies representing fourteen mines in operation. The total value of the asbestos produced amounted to $2,296,584, not including $20,468 worth of asbestic which is an inferior product obtained in the course of the preparation of asbestos for the market.

But, besides these nine companies, about an equal number were preparing to produce in 1910. The companies having works and mills under construction in 1909 were:

The B. and A. Asbestos Company, East Broughton.
Berlin Asbestos Company, East Broughton.
Belmina Consolidated Asbestos Company, Belmina.
Frontenac Asbestos Mining Company, East Broughton.
Black Lake Consolidated Asbestos Company, Black Lake.
Jacobs Asbestos Mining Company, Thetford.

There are also three other projected mills and the Bell Asbestos Mines Company is altering its plant so as to increase its capacity to 1,000 tons of rock a day. It should be noted that the tendency is to build mills of ever-increasing capacity. Some years ago model mills were fitted up to treat from 200 to 300 tons of rock per diem, while at present they are being put up with a capacity of from 1,000 to 1,200 tons.

Prospecting has likewise been carried on at various places in the serpentine belt. An important discovery is mentioned on lots 23 and 24, range A, of Coleraine, where a new company, the Thetford Asbestos Syndicate, with its offices in the Liverpool, London & Globe Building, Montreal, has had considerable work done. This company will soon be in a position to produce.

On the whole, the asbestos industry of the Province of Quebec is flourishing. Almost the whole of the world's production of this substance comes from Canada and Russia and, in 1909, Canada's proportion was nearly four and one-half times greater than that of Russia. In fact, the asbestos mines of the Province of Quebec shipped 63,965 tons last year, while those of the Ekaterinburg district, in the Ural Mountains, during the same period, was 814,134 poods, equal to about 14,500 tons, according to an article which appeared lately in the commercial and industrial gazette of St. Petersburg.

The Canadian asbestos is obtained by working the deposits of the serpentine belt running through the Eastern Townships of the Province of Quebec. There are three very distinct asbestos-bearing areas which are, in order of importance: The Thetford, Black Lake area, the Danville area and the East Broughton area.

The serpentine belt consists of igneous and metamorphic rocks comprising peridotites, pyroxenites, diabases, granites and serpentinous talcous schists. Although the serpentine rocks occupy a much more limited total area than the other constituents of the belt, they are much more important from the economic standpoint and are more easily recognizable through their particular characteristics. Serpentine results from the alteration of intrusive masses of peridotite or olivine rock and in this altered rock are the veins of asbestos which belong to the chrysotile variety. The relations between the vari-altered rock, are the veins of asbestos which belong to the chrysotile variety. The relations between the various constituents of that belt of rocks are complicated and have not yet been established with any degree of certainty, but everything leads to the belief that they are old and it is probable that the rocks are of Cambrian age.

The percentage of asbestos in the rock extracted from the mines varies greatly in proportion to the veins running through it. It sometimes amounts to a maximum of from 12 to 15 per cent., but, as an average of mining operations extending over a period of one year, the yield does not generally exceed four or five per cent.

The presence of this mineral in the Ural Mountains was discovered about 200 years ago, but it was not systematically mined until about 25 years ago. As in Canada, the methods followed at the outset were very primitive, but the industry has been developed and many of the mines are now provided with the most modern plant, the motive power being electricity.

The principal mines are situated about 57 miles to the north of Ekaterinburg in the Ural Mountains. According to a paper read by Mr. Kriganouski at a meeting of the Imperial Academy of Sciences, in 1903, the mining district covers an area of 18 miles from north to south, and of 2 to 3 miles from east to west. The mines are limited to a mass of serpentine resting on schistose rocks to the west and cut off by a granitic intrusion on the east. The serpentine is traversed by dykes of diabase and porphyry and also by veins of quartz. Asbestos is not found everywhere in the serpentine; on the contrary the deposits are in ellipsoidal areas whose main axis invariably runs north and south and which attain a maximum length of 3,500 feet. The fibres of the veins are perpendicular to the walls as in the case of the Canadian asbestos. The richest asbestos-bearing rock yields over 50 pounds of asbestos to the cubic yard of rock, but, in other mines, the yield is from 28 to 33 pounds.

The work is done in open cuttings, the quarries not being deep; so far the depth has not yet exceeded 70 feet. The serpentine is, as a rule, soft enough to be got out without the use of explosive, but, as the depth increases, the rock becomes perceptibly harder and dynamite is used in the deeper workings.

Russian asbestos is said to be not as silky as Canadian asbestos and is not as easily woven.

The Mica Industry.

This industry has been inactive during the year 1909. The figures we have received in connection with the production show a considerable decrease from the year 1908. The quantity of mica from the Province of Quebec for which a market was found in trade and industry in 1909, is valued at $27,034 only, as compared with $95,311 in 1908. Of thirty operators who sent in returns, nineteen only had worked and thirteen only had shipped products.

The figures given above represent the value of the mica shipped. There are, therefore, considerable quantities of this material in stock awaiting an improvement in the market and a rise in prices, for shipment. The conditions of the mica market have been very unfavourable during the year; prevailing prices have been below the average.

Phosphate of Lime.

Phosphate of lime may be considered as a secondary product extracted while mining mica, for, at current prices, that substance could not be worked solely on its own account. The shipments in 1909 amounted to 525 tons, valued at $4,800. The whole of this quantity was used by the Chemical and Fertilizer Company, of Buckingham.

Graphite.

Active operations have been resumed in the graphite industry of the Buckingham region. In 1908, work was limited to prospecting and experimenting, but this year products to the value of $10,399 were shipped.

Operations were confined to the Buckingham district. Nothing was done in the vicinity of Calumet or Grenville.

Some work has also been begun by a Montreal syndicate, the Graphite Limited, Board of Trade Building, Montreal, which has prospected in ranges 6 and 7 of the Township of Amherst.

It should be noted that a considerable amount of prospecting has been done in various places, which augurs well for the year 1910.

Magnesite.

Work was continued in 1909 on the magnesite deposits of Grenville Township, in Argenteuil County. A quantity of 630 tons, valued at $2,508, was shipped to Montreal.

These deposits have attracted much attention for some years because they are the only ones in Canada capable of being worked. As mentioned in previous yearly reports on mining operations in the Province of Quebec, the most important use to which it is put is as a refractory substance for lining various high temperature metallurgical furnaces. For this purpose there would be a considerable market in the United States and Canada for the product of the Grenville deposits.

Magnesite, when used as a refractory substance, is calcined and crushed. After undergoing this process it is worth from $25 to $37 per ton of 2,000 pounds in New York. It should be noted, however, that for this use magnesite must be very pure, that imported from Greece containing an average of 95 per cent. of carbonate of magnesia. The operators working the Grenville deposits assert that they can meet the consumers' demands as regards purity.

So far a depth of fifteen feet only has been reached and it is said that the magnesite at that depth is already purer than at the surface.

The present means of transportation are a serious obstacle to the rapid development of these deposits. The mine is about thirteen miles from Calumet, the nearest shipping station. No shipment can be made in summer over the road connecting the two points; thus the operations are limited to a few months in winter when loads can be conveyed over the snow roads.

The company operating there is the Canadian Magnesite Company, Eastern Townships Bank Building, Montreal.

Portland Cement.

The manufacture of Portland cement is one of the most flourishing in the Province of Quebec. This year we have to record a marked increase in production over 1908.

The chief feature of this industry in 1909 was the merging of the various companies manufacturing cement in the province into an association whose influence has a national character. In fact, the Canada Cement Company has acquired the three large cement factories of our province, together with several others in the Provinces of Ontario, Alberta and British Columbia. It is expected that the result of this amalgamation will be a considerable saving in the cost of management and especially of transportation, by which consumers will certainly benefit.

The manufacture of cement has made remarkable progress for some years past. Previous to 1904 there was but one factory in operation, whose production varied between 25,000 and 40,000 barrels a year. In 1905, the International Cement Company, of Hull, began producing and since then the figures have grown year by year as may be seen by the following table:

Year.	Quantity. (barrels)	Value.
1904	33,500	$ 50,250
1905	254,833	408,000
1906	406,103	625,570
1907	.....	640,000
1908	801,695	1,127,335
1909	1,011,194	1,314,551

Building Materials.

The figures we give this year in connection with other building materials, such as lime, building and ornamental stone, bricks and other clay products, slate, marble, etc., are necessarily very incomplete because there are many producers of slight importance from whom it is difficult to obtain reports. The same remark applies in the case of mineral waters.

It will be seen by the general table that we have recorded a production of marble valued at $130,000. This is the product of the Missisquoi Marble Company, whose quarries are at Philipsburg. That company has installed a modern mining plant and very complete dressing works. The product is a very fine ornamental stone which finds a market in the United States and Canada. A considerable proportion of the product in 1909 was sent to Buffalo in the rough state. Some marble was also shipped from Philipsburg to Ottawa, Toronto, St. Catharines, Winnipeg, Edmonton, Victoria, Halifax, Moncton and other points in Canada.

Three methods of precipitating gold and silver from cyanide solutions by means of zinc ore are in vogue. First, zinc dust is mixed with the solution and the precipitate is treated in filter presses; or second, the solution is passed through a spongy mass of zinc shavings, the precipitate being cleaned off by hand-washing; or, third, the solution is passed over zinc plates which are automatically cleaned of the precipitate.

ABSTRACT OF REPORT OF MR. JAMES ASHWORTH.

The accompanying plan was prepared by Mr. W. F. Robertson and his assistant, Mr. Nation, from plans and information supplied to them, and also an enlarged plan of same, which was of very valuable assistance to every witness who was called before the Court. Mr. Shepherd also prepared large diagrams of some of the separate parts of the mine, and these figured prominently in the enquiry. In addition to these plans, Mr. Robertson also prepared a drawing on a large scale of the "cave" in No. 2 1-2 level, showing graphically the condition of this particular length of the level.

The Wellington Colliery Company did not produce any plans or explanatory drawings. The first point of importance that presented itself to me was the very small volume of air in circulation in No. 4 counter-level, but I was assured that this was due to the disorganized condition of the mine, although it was the eighth day after the explosion. No great mechanical damage was in evidence on No. 4 West level, but when we reached No. 3 West level there were evidences of contrary forces which required the most careful attention. The first of these was a damaged boot torn off the foot of a labourer named Milos, whose body was found ten or twelve yards on the out-bye side of it, thus indicating that at the time of the explosion his foot had been held fast, possibly by a track-frog, and that the force which affected him had torn his right foot out of this boot, splitting the top of it from the lace-holes to the toe and partly separating the sole from the top, also breaking the fibula of his right leg, and projecting his body out-bye with such force that the top part of his skull was terribly fractured, and this injury caused his immediate death. Dust was also driven into the skin of the face and through his pants into his leg. Still farther out-bye pieces of brattice-cloth showed evidence of contrary forces, and near the foot of room 24 two bodies were found close behind a trip of three loaded cars. They were slightly burned, and some timber was piled on the top of them. The mule drawing the trip appears to have been killed instantaneously, as there is no evidence of its kicking. A strong force had also come down Nos. 24 and 25 rooms from towards No. 2 1-2 West level, tearing down the brattice-cloths and some timber also. Near the face end of the level is room 29, and the condition of this room evidently demanded careful investigation.

Samples of dust were taken off the coal which had fallen from the face, and also off a shovel. Other samples of dust were taken in the level for microscopical and analytical examination. In the level close to the in-bye chute of No. 29 room the body of the miner working in this room was found, and was certified by the doctor as being only burned on the hands. At the face of room 29, which had only recently been started, I found evidence of blasting, and the appearance and position of the coal and of the miners' tools led me to infer that it had had some connection with the explosion, particularly as the fallen coal was thickly coated with dust. I probed behind the coal and distinctly felt that a portion of the shot-hole still remained. On calling the attention of Mr. F. H. Shepherd and Mr. Andrew Bryden to this fact, they assured me that the shot had been fired the day before, and that the fireman said he found it when he made his rounds in the early morning before the explosion. This difference of opinion came to public notice in the Coroner's Court, when Mr. Shepherd expressed his disagreement with my deductions, and the Court was adjourned after the Coroner had directed that the jury should visit the mine and see whether or not there had been a shot-hole behind the broken coal. Mr. Hawthornthwait, M.P.P., Mr. Wolflin, U. S. A. Geological Survey, Mr. Cosier, the fireman in question, and others accompanied the party. The result was that my statement of fact was completely verified; and there was the further evidence that the shot had been fired on the morning of the explosion, and that Mr. Shepherd had been very seriously misled by the fireman Cosier. This shot had therefore been fired before the arrival of Mr. Alex. Shaw, who, having temporarily taken up the duties of the usual shot-lighter, had told the men that he would be in the mine by 9 o'clock to attend to the shot-firing. Microscopical examination

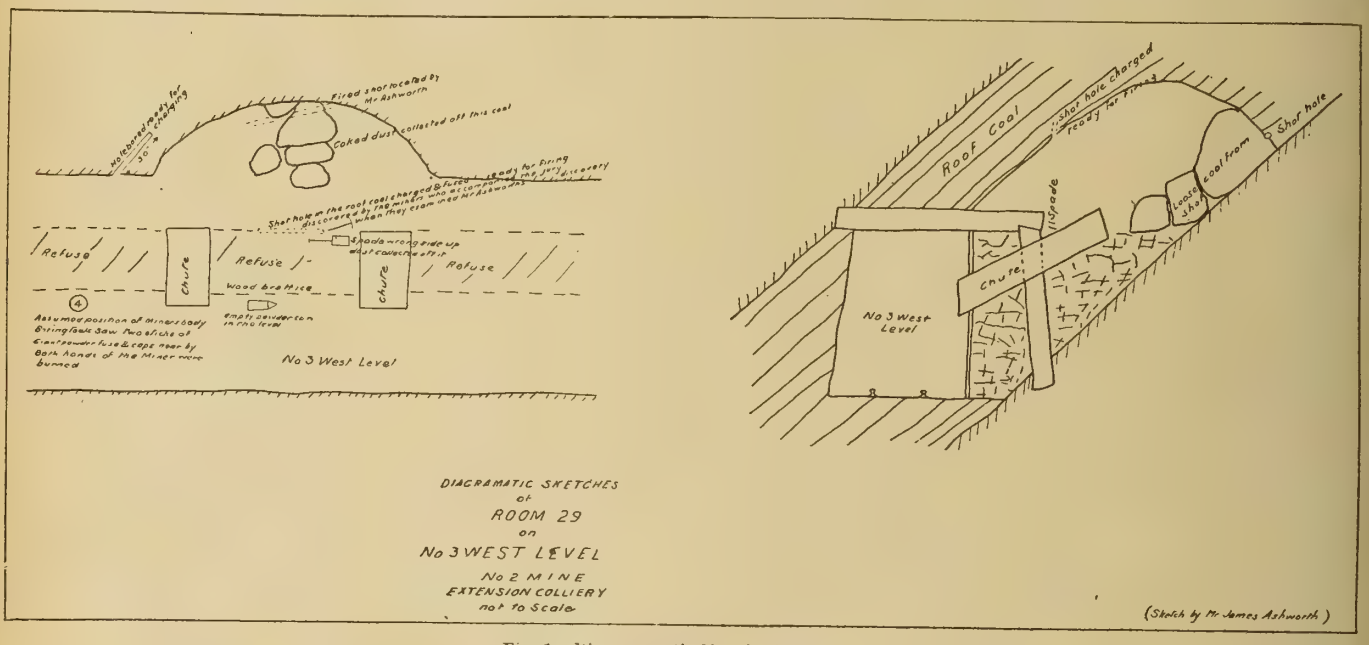


Fig. 1. Diagrammatic Sketch of Room 29.

by myself and others of the dust collected off the coal shows plainly that it has been affected by considerable heat, and this is also proved by the appended chemical analysis:

"Moisture, 9.69; Volatile Combustible Matter, 21.60; Fixed Carbon, 28.70; Ash, 20.01. The coking of the coal particles of this dust is very distinctly shown under the microscope, also in a sample taken off the top of the coal on the loaded cars between Nos. 23 and 24 rooms."

No. 29 room had an inclination of about 60 degrees, and was fitted with two chutes, down which the coal ran to the level where it was loaded into cars. The body of the miner Thomas, who worked in it, was recovered by a man who crawled in and brought it out of the level before it was considered safe to take a lighted lamp so far, and therefore the exact spot where it was found is only approximately known. The doctor who examined Thomas's body certified that it was burned on the hands and that the man died from carbon-monoxide poisoning. Why he should be burned on his hands only, seems a mysterious feature, but it shows that flame was present at this point. On every occasion when I inspected No. 3 West level I found not less than 3 per cent. of fire-damp mixed with the ventilating air-current.

Proceeding into No. 2 1-2 West level, I found a similar percentage of fire-damp. In No. 27 room there had been a heavy "cave" of the roof coal and practically everything in the room was buried under it. The miner working here, A. Keserich, had left his room for some reason or other, and was found in the level on the outbye side of the stall, and where the roof had not fallen. His body was the most severely burned of any in the mine, and the doctor certified that the hair, moustache, head, neck, hands, and left side of the chest were burned by fire. Farther out-bye a heavy "cave" of roof coal had taken place for a length of 240 feet (see Mr. Robertson's plan). The top of this cave was coated with dust affected by heat, as shown under the microscope, and therefore it had been deposited after the fall took place. The chemical analysis shows: Moisture, 3.69; Volatile Combustible, 27.70; Fixed Carbon, 36.00; Ash, 32.61.

Fig. 2. Plan of Extension Colliery No. 2.

Out-bye of this fall was a bridge of 36 feet long, where the roof had not fallen, but the timber supporting it had been knocked out by a force from the out-bye side, which had also thrown some of it on to the talus of the 240-foot fall. This force was caused by another cave of 239 feet in length, which at the east or out-bye end was 18 feet high. It was evident, therefore, that this cave took place after the explosion, and that the first-referred-to cave occurred before the explosion. This reasoning is further supported by the fact that some of the timbering that had been set up to support the roof of the first length was standing upright, with the fallen coal all around it.

The ignition and explosion of the fire-damp brought down by the first cave was undoubtedly the force which caused the main explosion and burned the men in the headings on the higher side of the level from No. 20 to No. 26, and also caused the pressure, burning, and percussive effects demonstrated in these working places.

degrees Fahrenheit. The mine was absolutely wet in the majority of places. A test was made with the Pieler spirit-lamp in the whole current of the return air, and although the tip of the flame was ill-defined, it was considered to be equal to a 2 per cent. content of fire-damp. The evidence given as to the volume of air circulating through this mine was so various that your legal representative, Mr. Harold Robertson, asked the coroner to send Mr. Dick, Inspector of Mines, to visit the mine and report the volume passing at three separate points. The estimate given by Mr. Dick in his evidence-in-chief was 17,500 cubic feet at the delivery end of the return, and at the same place Mr. Shepherd had 28,080 cubic feet as his measurement. Mr. Bryden gave three separate estimates of the volume of air in circulation: Firstly, of 90 per cent. of the whole return for the working places; then 25,000 cubic feet; and, later, 10,000 cubic feet at the faces. Mr. Dick reported to the coroner that he measured in the mine return air-way

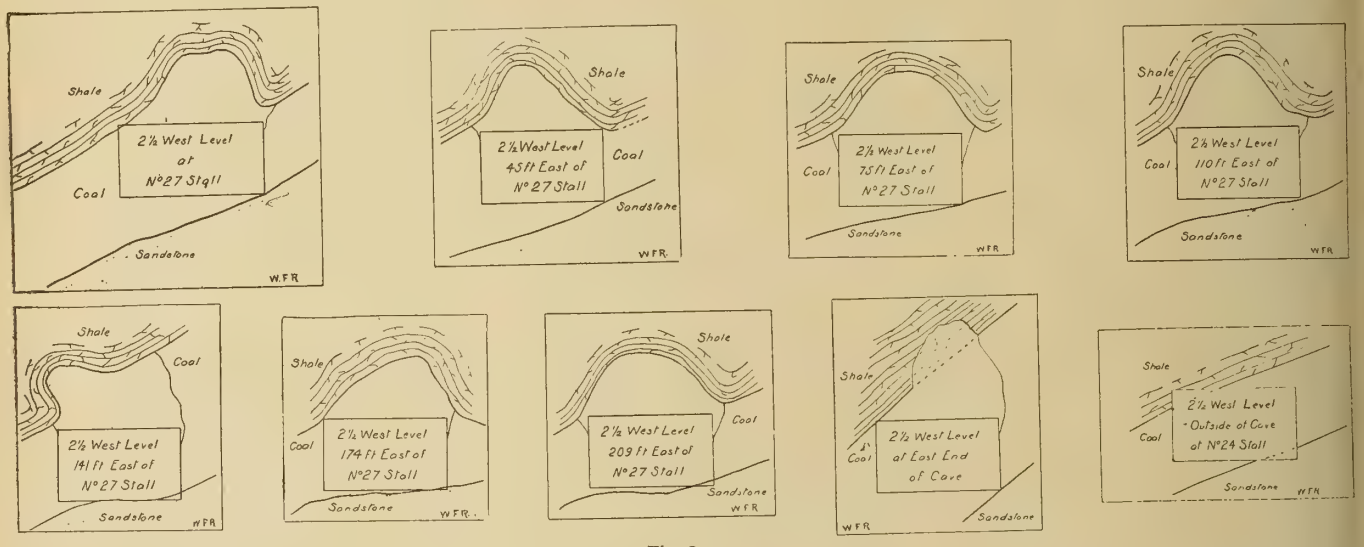

Fig. 3.

When the whole of the return air from this section of No. 2 mine was tested for fire-damp in the crosscut between Nos. 19 and 20 rooms, it showed fully 3 per cent. of fire-damp. Another evidence of the direction of force on No. 2 1-2 West level was found where No. 15's body was found. This boy had been driving a mule drawing two empty cars, and it is surmised that he was riding on the front car when he was blown into the car and burned on the face, neck and hands. The mule was either blown or jumped into the first car with its forelegs and was killed. The only animal which survived the explosion was a mule in No. 4 level. Several men on No. 2 1-2 West level, out-bye of the fall, were killed in various places on the level by carbon-monoxide poisoning, and were also slightly burned.

On the 16th inst. I accompanied Mr. F. H. Shepherd and Mr. Bryden to make tests on the volume and humidity of the air circulating in No. 2 West mine. The whole volume of return air amounted to 28,080 cubic feet per minute. For some reason or other the anemometer would not work in the crosscut between Nos. 19 and 20 rooms on No. 2 1-2 West, and no further tests could be made. Hygrometer tests were made in many places and all proved that the air in the mine was practically saturated with moisture, and in no case was there less than 5.10 grains per cubic foot, and not more than 5.51 grains per cubic foot. The greatest heat of the air inside the mine was only 59 degrees, and the lowest 52

34,500 cubic feet; in the intake in No. 4 West level, 16,000 cubic feet; and between Nos. 3 and 4 West levels, 6,600 cubic feet per minute. These figures were so conflicting that Mr. Robertson did not cross-examine on them. It is, however, important to consider them very seriously when deciding whether or not the mine was supplied with a sufficiency of air to dilute the gas produced, and to make the mine safe for shot-firing. I have not the least hesitation in saying that, on every one of the five visits I paid to this mine, it was unsafe to fire shots of black powder or giant powder in any of the working places on Nos. 2 1-2 and 3 levels of No. 2 West mine.

The English Royal Commission on Mines appointed a sub-commission to report on the ventilation of mines. After examining mines in England, Scotland and Wales, they suggested that 2 per cent. of fire-damp in the volume of air circulating in any working place should be considered dangerous. This suggestion, however, did not receive the approval of the coal-owners, and a minimum of 3 per cent. was suggested by one district as an alternative, and because the majority of officials cannot detect 2 per cent. of gas with an ordinary safety lamp. The matter is still *sub judice,* I believe.

As previously stated, there was at least 3 per cent. of gas present in the air ventilating Nos. 2 1-2 and 3 levels of No. 2 West mine of the Extension colliery, and therefore, on this basis, the volume of air was inade-

quate. What percentage of gas was called a "cap" by the Extension mine officials was not very clear, but the impression conveyed to my mind was that only such gas was reported as would bring the air-current very close up to the explosive point—that is, far above 3 per cent. The officials, however, stated in evidence that they considered a half-inch cap dangerous, and some thought 3 per cent. was dangerous.

In Messrs. Dick and Bryden's reports on the volume of air circulating in the mine, a leakage of not less than 27,900 cubic feet of air per minute was unaccounted for, and this leakage shows how important it is that the intake air in a mine should always be measured and compared with the whole of the return volume, and to thus ascertain the percentage of loss. The current of air ventilating the western part of No. 2 mine was also complicated by a current of air coming from No. 4 level east, and thus when the explosion occurred the after-lamp driven into the slope through the doors of Nos. 2 1-2, 3, and 4 levels was compelled to circulate with the air into the eastern part of the mine and return through No. 4 West counter-level. The west side might, therefore, have been more quickly cleared of after-damp if a heavy curtain hanging in the diagonal slope to divert the air into No. 4 East had been lifted up, and thus permitted more air to enter No. 4 West counter. It is surprising, therefore, to find that twelve men escaped alive. The question as to whether or not other five men lost their way is immaterial, because they were hemmed in on all sides by after-damp.

I have to suggest, firstly, that the ventilation of the east and west sides of No. 2 mine be by entirely separate air-currents; secondly, that the use of safety-lamps be made compulsory as the means of lighting; thirdly, that only permissible explosives be used in place of black and giant powders; fourthly, that shot-firing be permissible only under statutory regulations; fifthly, that no shot be fired where there is more gas present than would be indicated by a blue cap 1-4 inch high.

Increasing the Number of Inspectors.—The popular idea appears to be that more men should be appointed to examine and report on mines, and that such reports should be equal to the standard report of a colliery fire-boss. Personally, I do not think that it will work out as satisfactorily as it might appear probable to do at first sight, because such an inspection lowers the status of an inspector, who, from my point of view, should be equal to a first-class certificated manager, and should be able to supervise the manager and his officials, in the same way that a first-class certificated manager supervises his under-officials. On this basis an inspector of mines would take a more general view of mining, and would in no sense relieve the fire-boss of his responsibility, nor himself assume and responsibility for the safety of a coal-mine.

Cause of the Explosion.

Although the first cause of this explosion has not been positively ascertained, yet it has been demonstrated that if fire-damp had not been present there would have been no explosion, because coal-dust took no very pronounced share in it. If, therefore, a shot fired in No. 29 room on No. 3 West level were the initial cause, then it is clear that the ventilation was too small in volume to keep the mine clear of gas; but if the fall of roof in No. 27 room of No. 2 1-2 West level came down without the assistance of the disturbance caused by the shot in No. 29 room, then I should say that this very large fall of roof coal, which could not have been foreseen, brought down a large volume of fire-damp, and that the explosion originated at the open light of the miner No. 16, as shown on the accompanying plan.

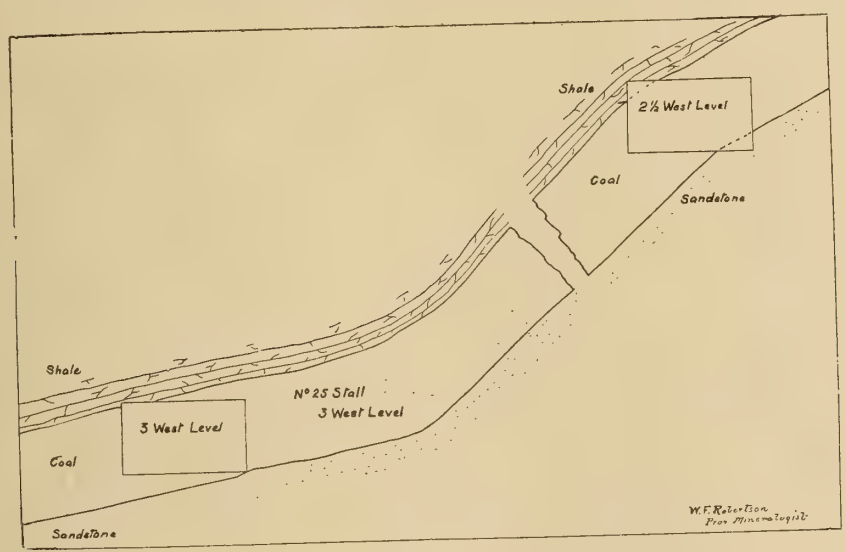

Fig. 4.

I have lastly to recommend that double doors be made compulsory in all cases where the system of ventilation is similar to that of the slope district of the mine in question.

Below I apend the report of Mr. S. D. Wark, of the Crow's Nest Pass Coal Company, Limited, Fernie, B.C., on a sample of dust from No. 29 room of No. 3 West level of the Extension mine, No. 2 district:

"Two slides were made, one of coal and another of the dust, and examined under the microscope, the object being to try and detect a difference, if any, in the structure of the two. An examination of the dust showed in a convincing way that it had been subjected to fire. It showed a steely grey appearance very much like coke, the boiling or swelling in the process of coking being very pronounced. The coal, on the other hand, showed no such alteration.

"By way of comparison, another slide was made from our own coke, and its likeness to the dust was very distinct.

"Following this, a test was made to try and detect whether any of the volatile matter had been driven off.

The sample was first dried for about an hour until it ceased to lose weight, and when examined again the steely appearance was quite evident to the naked eye, differing entirely from the dried coal-dust. An analytical comparison of the two samples shows the following:

	Moisture.	Vol. Matter.	Fixed Carbon.	Ash.
(29)	9.69	21.60	48.70	20.01—100%
Coal	1.05	35.00	56.95	7.00—100%

and, therfore, a decided contrast in the volume of their volatile contents.''

* * * * *

Since writing and forwarding my report on the No. 2 Extension mine explosion, I have received a copy of the plan prepared by Mr. W. F. Robertson, blue prints of Messrs. W. F. Robertson and F. H. Shepherd's

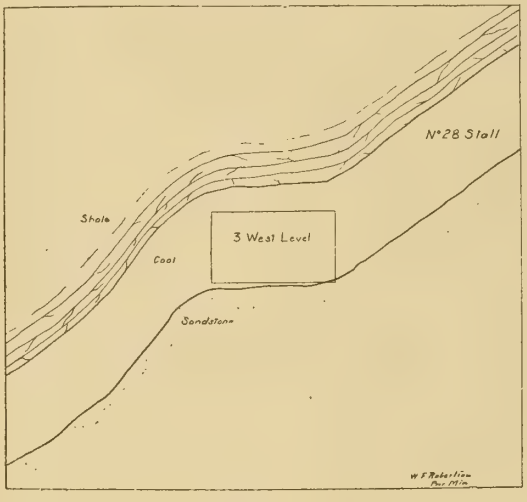

Fig. 5.

sketches, and also a copy of the verdict of the jury.

I notice that the plan does not show the entire course of the ventilation before the explosion, and, consequently, the direction in which the ''auxiliary'' current of air from the down-cast shaft, marked in the right-hand bottom corner, passed through some portion of No. 2 east workings, and was then added to the intake air entering No. 4 West counter-level. The ''cap'' of fire-damp found in No. 4 West counter-level probably came along with this auxiliary air-current. The plan shows single doors on Nos. 1 1-2 and 2 West levels, as well as on Nos. 2 1-2, 3 and 4 levels, and that coal working was proceeding on No. 1 1-2 level. These single doors evidently account to some extent for the great loss in the volume of the intake air-current entering the lower part of the mine.

With reference to the verdict of the jury, the principal point calling for attention is the apparent assumption that the fall or cave of roof coal in No. 2 1-2 West level took place under normal conditions, and without the assistance of any disturbing influence. It is, however, quite clear that there were other and prior manifestations of force preceding this cave. Thus there was the shot in No. 29 room of No. 3 West level, which was specially uncovered by the coroner's order for the jurymen to see, and the blowing of the man Milos (No. 6 body) out of his boot.

The positions in which the bodies of several men were found, away from their working places, showed that something had scared them before the explosion occurred at the cave-in on No. 2 1-2 West level. Thus No. 2 and 3 men had run out quite 200 feet from the face of No. 3 level; Nos. 7 and 8 had run about the said distance out of the face of No. 2 1-2 West level, and No. 16 had gone out of No. 27 room on the same level. Only one of these men, No. 16, was burned. The absence of burns on bodies Nos. 7 and 8 is of the greatest importance, because Mr. Shepherd fixed on the end of No. 2 1-2 West level as being the place where the explosion originated, for he says, ''the explosion was caused by the compression of the atmosphere in the face of No. 2 1-2 West level.'' He also acknowledges that there was coking near the face of the level, and of the dust on the loaded car at the face—and yet the men were unburned, and one man left his cap and lamp behind him near the face. Certainly, if these men had been in their working place when the flame of the explosion entered it, they must have been killed on the spot. Mr. Shepherd, in his written evidence, stated that there was no evidence of flame in No. 3 level, but, to my mind, there are most important traces of flame at this point. First, in the fact that the hands of the miner Thomas were burned until the skin hung on them like a glove, and then the fact that the dust I collected in No. 29 stall was coked.

Other important collateral evidence has been found in No. 29 stall—namely, a hole 50 inches deep bored into the roof coal charged with nearly one whole stick of giant powder and fused ready for firing; also another shot-hole 30 inches deep on the left-hand side of the room, uncharged. It is fair to assume that Thomas had drilled a series of three holes, and then removed his drilling tackle into the level; he then charged two holes, in contravention of Rule 9A of the ''Coal Mines Regulation Act,'' and fired one, probably intending to fire the other afterwards. It is not improbable that he was preparing to charge the 30-inch hole also, as two sticks of giant powder (not in a case), fuse, and caps were close to where Thomas's body was found.

These facts confirm my original opinion that the first factors in this disaster are disclosed in the surrounding conditions of No. 29 stall on the No. 3 West level.

With regard to the jury's No. 3 recommendation, life-saving oxygen apparatus such as the Draeger, Weg, etc., is expensive to buy and expensive to maintain, and if any of these apparatus had been in use at the Extension mine they could not have saved any lives. I might, however, mention a much simpler apparatus which I have often used—namely, the Denayrouse. It consists of a mouth and nose piece and a valve for the expired air placed at one end of a strong flexible tube, which is attached by a belt to the wearer, and the other end of, say, 100 feet of tube is coupled to an air-pump. This apparatus is easily kept in order and may be stored in any convenient place underground.

The August number of the Mexican Mining Journal is a special cyanide number. Special articles from many prominent experts and operators are presented. Eighty-two pages of reading matter are given over to articles on every phase of modern cyanide practice.

The Coal Mines Regulation Act of British Columbia provides that all the officers of a company having charge of work underground shall hold Government Certificates of Competency. These can only be obtained by passing an examination before the Managers' Board. Three certificates are granted, the First-Class or Manager's, the Second Class or Overman's, and the Third Class which must be held by every shiftboss, fireboss, or shotlighter.

MINING AND METALLURGICAL OPPORTUNITIES IN CANADA.

(Written for the CANADIAN MINING JOURNAL by A. B. WILLMOTT, Mining Engineer, Toronto, Ont.)

Prefatory Note.—In the following brief article attention is called to some industries connected with mining, which apparently might be profitably established in Canada at once. Where data are available the market is given, and the source of the raw material indicated. I do not pretend that I have critically examined into all the conditions that make for success, but only that the subjects mentioned are worthy of careful study by investors looking for meritorious propositions.

I.

Soda.

The report of the Department of Customs for the year ending March 31st, 1909 (the latest available), shows a consumption in Canada of caustic soda, soda sal and soda ash valued at $479,882. There was a further consumption of salts of sodium, omitting sodium nitrate, of over $150,000, some of which might be profitably manufactured. It thus appears that there is a market in Canada at present for over half a million dollars worth of sodium products. The following table compiled from the report referred to shows the present source of the sodium compounds consumed in Canada and their value as entered at the customs house:

Countries.	Imports. Quantity. Lbs.	Value.
Soda Ash—		
Great Britain	17,686,755	$138,811
United States	4,503,266	41,124
	22,190,021	179,935
Caustic Soda—		
Great Britain	7,368,959	139,525
Germany	100	10
United States	3,334,996	67,552
	10,704,055	207,087
Soda Sal—		
Great Britain	4,230,678	24,495
United States	6,867,461	68,365
	11,098,142	92,860
Total	43,992,218	$479,882

Salt, which is the raw material for all these compounds of sodium, occurs in great abundance in Ontario. In the district bordering Lake Huron and Lake St. Clair, from Lake Erie northwards as far as Kincardine, are strata of the Upper Silurian abounding in salt. At Kincardine the salt bed is found 880 feet below the surface, at Clinton at 1,170 feet, at Courtright 1,620 feet and at Windsor 1,272 feet. The quantity of salt is inexhaustible. At Goderich the six beds aggregate 126 feet of solid salt. At Blyth a bed 80 feet thick is known; at Petrolea, one 105 feet thick; at Windsor, one 250 feet thick. All the beds are not of equal purity; the second and third at Goderich are among the purest known, yielding on analysis 99.7 per cent. of salt. These beds are exploited by driving down a casing pipe to the salt bed in which is inserted a second pipe of smaller diameter. Water is forced down the outer pipe and rises to the surface through the inner, charged with the salt which has been dissolved. These brines are largely sodium chloride, with very small portions of calcium chloride, magnesium chloride and sulphate of lime.

The production of salt from Ontario in 1908 was 79,975 tons, valued at $378,798.

That these salt beds are well adapted for the soda industry is abundantly shown by the fact that across the Detroit River the Solvay Company has a very large plant manufacturing various soda products from the same salt beds that occur in Ontario.

On seeking a suitable locality for such an industry transportation of both raw and finished products must be taken into account, and to a lesser extent the cost of fuel or power. The source of salt will naturally be some point close to the Great Lakes, like Goderich, Sarnia or Windsor. Such a point offers water transportation for the finished products as well as rail, and further permits the importation of coal for fuel at a low figure. On the other hand, if electrolytic soda is to be produced some point in the Niagara Peninsula, where electric power is cheap, would seem more suitable. At any rate Ontario affords large quantities of salt of excellent purity and cheaply produced. There are, further, cheap power and excellent transportation facilities. Added to this there is a market now for half a million dollars' worth of sodium compounds yearly and the probabilities of a great expanse.

(To be Continued.)

THE PRICE OF COAL.

There has just been issued by the Federal Department of Labour a bulky special report entitled "Wholesale Prices in Canada—1890-1909." Mr. R. H. Coats, B.A., associate editor of the Labour Gazette, is the compiler.

The tabular statements showing the wholesale prices of coal are noteworthy. In 1890, the average wholesale price per ton of 2,000 pounds on wharf at Montreal was $2.462. For four successive years the average price remained at precisely the same figure. Then, up to 1900, there were very slight drops. During 1900, the price went up to $3.075, and in the succeeding year it reached $3.498. During 1909, the average price was $3.602. The increase in price, therefore, during 20 years is only 64 cents, or about 21 per cent. of the price in 1890. These figures apply, of course, almost exclusively to Nova Scotian coal.

In 1890, anthracite sold in Montreal at an average price of $4.875. In 1909, the price was $5.683—an increase of 80.8 cents, or about 16.6 per cent. of the former price.

The El Oro mine has ore reserves totalling 441,639 tons, and averaging $8.06 in gold per ton. The ore also carries 3 ounces of silver per ton. The ore ranges in gold content from $6.15 per ton to $18.09 per ton. In the previous year the average gold content was $9.10 per ton.

THE ENGINEER GROUP, ATLIN MINING DIVISION, BRITISH COLUMBIA.

Reported High Gold Returns from Small Quantity of Quartz.

BY E. JACOBS.

British Columbia newspapers lately printed a news despatch from Atlin, in which statements were made to the effect that 20 pounds 8 ounces of gold had been obtained from 800 pounds of quartz put through a stamp mill at the Engineer mine; that three tons of selected ore on hand will return from $6,000 to $10,000 per ton; that about 200 tons of ore taken out since January will average $150 per ton; and that a 100-stamp mill is to be erected. In view of the unusually high-stated value of the "selected" ore and the impression of the importance of the mining development there, as suggested by the alleged intention to erect so comparatively large a stamp mill on the property, the information given below has been taken from provincial official reports, so that those interested may be assisted in arriving at reasonable conclusions in this connection.

The original Engineer group was owned by the Engineer Mining Company, of Skagway, Alaska. It embraced thirteen mineral claims situated in Atlin mining division, on the east side of the southern part of Taku Arm, this arm being a branch of Tagish Lake. The old route from Log Cabin, on the White Pass and Yukon Railway, via Otter Lake to Atlin, crossed Taku Arm and entered Taku Inlet, the mouth of the latter having been known as the Golden Gate. The Engineer group is about nine miles south of the Golden Gate.

In the summer of 1900 the provincial mineralogist, Mr. Wm. Fleet Robertson, paid an official visit to Atlin district, but having to proceed thence to Chilkat district before the season was far advanced, he had not time to personally examine the Engineer group. However, he obtained from the secretary of the Engineer Mining Company, then resident at Skagway, the following particulars, which were printed in the Annual Report of the Provincial Department of Mines for 1900:

"The property was taken up by a locating party of engineers of the White Pass and Yukon Railway, hence the name 'Engineer' group. The discovery was made on a small stringer of quartz carrying free gold visible to the naked eye. Assays of specimens taken from this stringer gave any results up to $13,000 per ton. Development work was begun on this stringer and continued over the greater part of the property. In following the stringer a large body of quartz was struck, running at an angle of 60 degrees with the strike of the former. Further prospecting disclosed parallel ledges and stringers, and samples of quartz were taken and assayed, but gave little satisfaction. Four tons of ore from the rich stringer was then taken out and was milled at Juneau, some $23 per ton having been saved on the plates and one per cent. of concentrate, worth $83 per ton, obtained. A tunnel was then started from the shore of the lake and was driven 250 feet through slate, the formation dipping into the mill. At 215 feet in, and not quite at right angles, this tunnel cut a quartz ledge 20 feet in thickness. The company had nine men at work during the summer."

In a prospectus issued by the company there was shown a table giving details of results obtained by fire assay of five samples, described as general average samples, and from cyanide tests of three similar samples. The assay returns in gold and silver ranged from $10.54 to $17.09 per ton, with an average of $13.05; those from cyanide tests were from $30.03 to $59.63 per ton, with an average of $40.95. It was stated that "the great presence of tellurides in the ore accounts for the small fire assay of the identical samples. All cyanide tests have been made after a preliminary roasting of the ore."

The provincial mineralogist wrote: "I shall make no comments upon the remarkable differences shown above between the fire assays and cyanide tests on identical samples. A number of selected, not average, samples of the ore were obtained from the company, certain of which showed free gold, but, although tested repeatedly by the provincial assayer, none of the ore could be found to give the reaction for tellurides, although obtained from the company as samples of the telluride ore and in order that it might be so tested."

In the Annual Report for 1904 the provincial mineralogist gives the following information relative to this group: "Since 1900 considerable money has been spent on its development by the Engineer Mining Company. The claims, which have not as yet been surveyed, extend along the lake shore and part way up the mountain, covering the bench-like foothills, which are some 400 feet higher than the lake. The property has not been worked this past year. A tunnel, driven to crosscut a large body of quartz outcropping on the bluff above, had been started below the level of highest water mark, and had, in consequence, been flooded by the spring floods. The tunnel ran in straight for about 200 feet, and at a point 175 feet from the portal, a drift had been made to the right for about 115 feet, from which exploratory cross-cuts, etc., had been run to the extent of about 75 feet in all. The tunnel had cross-cut through slate, cutting in its length several small quartz veins, and the main vein was developed by the drift which showed the quartz to be from 7 to 20 feet wide. This main quartz lead continued in the drift for about 80 feet from the tunnel intersection, when it seemed to disappear into the wall, and the subsequent exploratory workings had not picked it up again, except as small stringers. The quartz is white and vitreous in appearance, showing very little mineralization, while samples therefrom gave only a trace in gold. The tunnel had been laid with steel rails, and well equipped with cars, blacksmith shop, sheds, etc. This is the largest showing of quartz seen on the property, but it is not the showing for which the stamp mill was brought in. That showing is located some 600 feet further to the south along the beach at the original point of discovery. Here, a small stringer of quartz at right angles to the general trend of the larger quartz vein—viz., east and west—cuts from the shore into the hill, on which from the beach a shaft had been sunk 30 feet, and from this shaft it is reported most of the rich samples taken from the property were obtained. Where this stringer should cut the hill, and 100 feet above high water, a 3-compartment shaft had been sunk for 70 feet. This was well equipped with a Joshua Hendy steam hoist and locomotive boiler, all covered over by

he frame of a fine building, which had never been completely boarded in, but was left unfinished. Just below, near the beach, has been erected the frame-work of a stamp mill and bins, all excellently built, but only half completed, while on the beach in a cabin is apparently the complete machinery for the mill which has never been erected."

The foregoing information, it should be kept in mind, relates to the Engineer group as officially described in the years 1900 and 1904 respectively. There was also a brief reference to the property in the Annual Report of 1902, as follows: "Some development work was done during last winter, and a triple-discharge Hendy stamp mill complete is now being installed on the property at an estimated cost of $15,000. The mill is expected to be in position and ready for work by February 1st, 1903, and as soon as warm weather sets in it is expected to open up on the ore body and start crushing." That expectation, however, was not realized. The only official mention made of this property since 1904 was this brief notice in the Annual Report for 1908: "Two years ago the original holders of the Engineer group allowed some of their properties to lapse and they were located by local parties, who have been doing some development work during the year and who are reported to have discovered some very rich ore. This rich ore is only found in small stringers, but I am informed that several larger and better defined ledges have been discovered on the properties."

Of course, it may be that the Engineer mine mentioned in the press despatch recently published, is distinct from that the official information above quoted relates to, but the probabilities are that the properties are identical. If so, it would appear that it is not reasonable to conclude that anything like sufficient development work has been done and ore blocked out to afford justification for the erection of a 100-stamp mill. It is not at all unlikely that a comparatively small quantity of selected and unusually rich quartz was accumulated during the time it was regarded as prudent to "keep quiet" pending the obtainment of a good title to the property, but beyond that it will be well to await full and thoroughly reliable particulars before giving full credence to the recently-published statements concerning this mine. It is satisfactory to learn that the Provincial Department of Mines has sent Mr. Herbert Carmichael, provincial assayer and assistant to the provincial mineralogist, to investigate on the spot and thereafter make an official report to the Minister of Mines. Meanwhile it will be well to suspend judgment, for recent experience has shown how utterly unreliable some of the so-called mining news published by newspapers has been.

THE ELECTRIC OPERATION OF THE INDIANA STEEL PLANT.

By Frank C. Perkins.

At Gary, Indiana, the new works of the United States Steel Corporation is very largely operated by electric power and the controlling apparatus of the Cutler-Hammer type utilized at the Indiana Steel Plant is of special interest.

The accompanying illustration, Fig. 1, is a view of the rail mill at Gary, Indiana, looking across the rail transverse and bloom shear table. In the pulpit immediately behind the bloom shear will be seen the starting panel for the bloom shear motor and the controlling apparatus for the stop motor. The illustration, Fig. 2, is a view underneath the tilting table at the 3-inch roughing mill, while at the left will be seen the automatic limit switch for stopping the table at the top and bottom, while at the right will be noted the disc brake and the conduits and methods employed in bringing the power cables to the apparatus. The electrically-operated 3-high roughing roll at Gary, constructed by the United Engineering and Foundry Company, of Youngstown, Ohio, will be noted in illustration, Fig. 3, which also shows the operating pulpits and controlling apparatus.

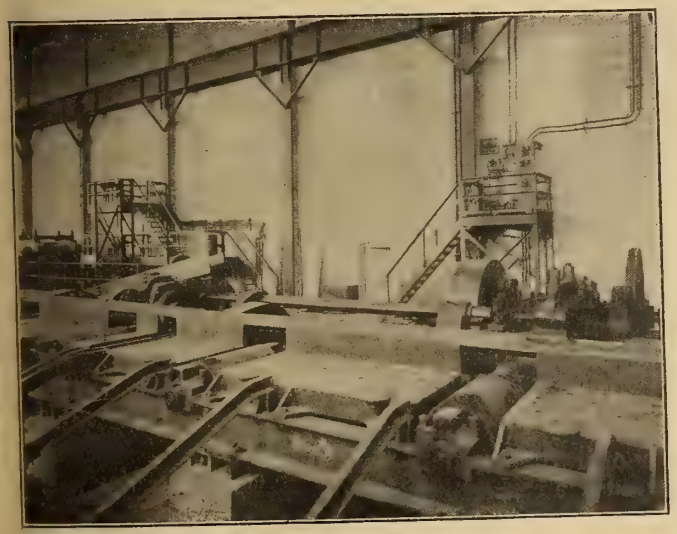

Fig. 1.

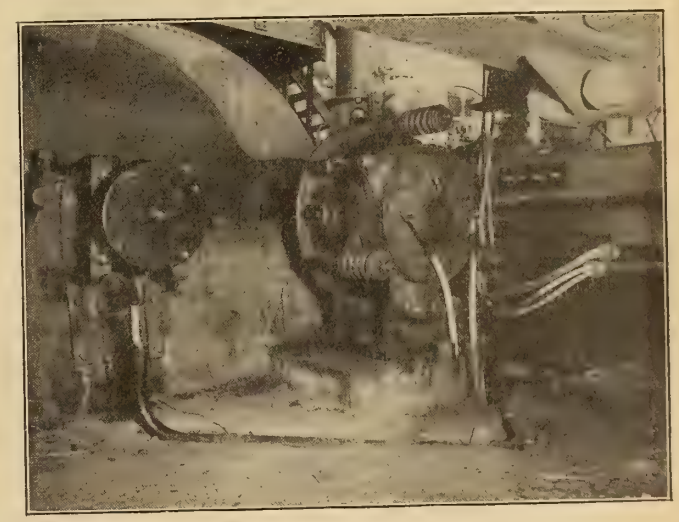

Fig. 2.

A typical contactor controller installation at the electrically driven rail mill at Gary, is shown in the accompanying illustration, Fig. 4. At the right of the control panel will be seen an auxiliary panel equipped with electric lamps for ground testing.

It is clear that the problem of control presented by the multitude of motors installed at this plant involve

many interesting features. The solution of these problems has engaged the attention of the many experts for many months and the automatic controlling devices installed at Gary represent the most recent developments in the art of electric control as applied to steel mill machinery.

There are automatic controllers in connection with motors on the transfers which make it possible for the operator to transfer the rails from one table to another by a simple throw of the lever, the motor being automatically stopped after the transfer has been completed.

There is a regulating system in the power house for use in connection with the storage battery plant, the object of this system being to maintain the power house load as near constant as possible. The various motor generator sets and converters, comprising this regulating system may be started and stopped from the bench board in the switching gallery by means of remote control field rheostats.

It is held that one of these remote control starters is remarkable for its great capacity and it is used in connection with a motor generator set which is started from the direct current end, and, although the starting current is not abnormally high, the rheostat is designed to carry 10,000 amperes under maximum working load conditions. This is believed to be the largest remote control starter ever built.

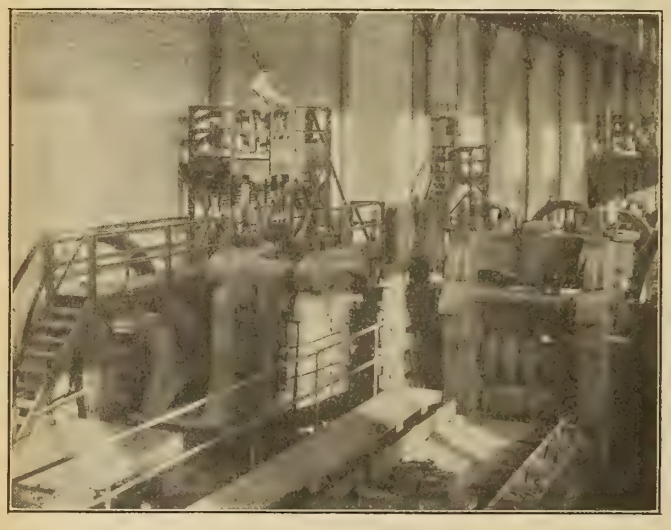

Fig. 3.

In connection with the various generators in the power house there are also installed a large number of Cutler-Hammer remote control field rheostats and field switches. The controlling apparatus is located in the basement as near as possible to the generators and are operated from the bench board located in the power house gallery. It may be stated that these rheostats used are of a unique design, they are of the "Cross head" type and are driven by means of vertical motors and are provided with automatic devices which insure the stopping of the motor at either limit of the "Cross head," travel, this is to say, either when all resistance has been cut in or cut out of circuit. Means are provided, also, for operating these field rheostats by hand in case of damage to the motor.

The controlling apparatus in the gas producer plant, where gas is generated for the open hearth is so arranged that it can automatically weigh and record the amount of coal used. At first the coal is received in the hopper-bottom cars from which it is dumped into a bin. A motor operated double skip hoist takes the coal from this bin, the door of the coal chute being automatically opened by a mechanical connection as the skip bucket settles into the pit beneath the bin. The opening of this door permits coal to discharge from the bin into the skip car and when 4,000 pounds of coal has been run into the car a counter weight is lifted and this automatically starts the hoist which lifts the loaded skip to the top where it dumps automatically and the hoist is stopped.

When the first skip car is in the dumping position, the second is lowered beneath the chute and the operation is repeated. The cycle continues as long as there is any coal in the bin and by means of a counter for counting the number of trips, the amount of coal delivered to the gas producer is accurately determined and recorded.

Fig. 4.

The automatic remote control devices installed in the rail mill are among the most notable at the plant. The control of the elevating and tilting tables, the bloom shear and the transfer is of special interest. The elevating table on the 48-inch blooming mill, weighing about 250,000 pounds is supported on huge bell cranks which are connected to a rotating crank driven by a 250 h.p. motor operating at 150 revolutions per minute.

Automatic controlling devices are used in the throwing of a master lever which starts the table from the lower level position and raises it to the highest level where it is automatically stopped. In lifting the table from the low to the high level, the rotating crank revolves through an arc of 180 degrees and on throwing the master lever to the reverse position the rotating crank revolves through another 180 degrees in the same direction, bringing the table to the low level once more. The operation of raising or lowering the table can be accomplished in a period of two seconds which is quite re-

markable when the masses to be accelerated, slowed down and stopped are considered.

A 75 h.p. induction motor operates the bloom shear, there is a pin on the clutch driven by a direct current auxiliary motor of 5 h.p. and the circuit of this 5 h.p. motor is interlocked with the controlling device for the 75 h.p. alternating current motor so that the former cannot be operated except when the latter is running at full speed. The latch is operated by a crank to which the 5 h.p. motor is geared. Pressure on a push-button under control of the operator, causes the motor to run long enough to revolve the crank 360 degrees thereby releasing the clutch and returning the pin to the initial or "Off" position.

It may be stated that the equipment of the tilting table is very similar in arrangement to the elevating table, one end being pivoted and the other end supported on a bell crank. The tilting table is driven by a 150 h.p. motor controlled by a Cutler-Hammer controller similar to that designed for the elevating table.

It will be noted that the steel produced in the open-hearth is cast into ingots which are delivered to the soaking pits where they are re-heated for rolling into rails; there are twelve soaking pits in all, six on either side of the rail mill. Two electrically-operated ingot buggies deliver the heated ingots to the rail mill, each buggy serving six pits.

These ingot buggies have a most ingenious system of control. On account of the length of the building in which the soaking pits are located, it is impossible for the operator stationed at the mill to see when an ingot buggy is opposite a particular pit. It was, moreover, necessary to guard against the possibility of the operator becoming confused and bringing both ingot buggies to the mill at the same time, which would result, of course, in a collision.

For guarding against this contingency a special automatic controlling system was provided and it also enables the operator to stop the ingot buggy at any of the pits by merely setting a controlling lever on the notch corresponding to the pit in front of which it is desired to halt the buggy.

It may be stated that the operator in the mill has in front of him two master levers for the control of the two buggies. Each of these controlling levers can be set in any of eight positions, one of these positions corresponding to the mill itself, six to the six soaking pits which the buggy serves, and one off position. If, when one of the ingot buggies is at the mill, the operator desires it to go to pit No. 5 and there stop, he merely moves the controlling lever to the position corresponding to pit No. 5. Immediately the buggy proceeds to that point and is there automatically stopped and there is a suitable interlock between the two controlling levers which renders it impossible for the operator to throw both levers to the mill position at the same time.

A clear track for each buggy is therefore insured. This controller equipment of the Gary electrically-operated steel plant undoubtedly represents the most up-to-date and successful in modern electric motor driven steel mill practice to-day.

The Portland Canal district has now a population of about 3,500 persons. This estimate does not include men employed on railroad construction.

A pyrite ore containing 40 per cent. recoverable sulphur usually assays between 42 and 43 per cent. Payments are customarily made on the assay values.

ARE BRITISH COLUMBIA ORES IMPROVING?

By E. Jacobs.

Among other notes on "The Financial Situation," the Toronto Globe on July 30th printed the following: "Are the British Columbia ores improving? The British Columbia Copper Company is bettering its position through increased gold values which have been encountered in its operations, and now comes the Consolidated Mining & Smelting Company with an increase in the percentage of gold in its metal production from 42.79 last year to 46.6 per cent. in the fiscal year ending June 30th. The larger percentage last year was important enough to add $458,000 to the company's receipts, in fact, the increase in the value of the metal production is due entirely to the gold. Silver and lead fell below the previous year, and copper made a very slight increase. The gross value of metal amounted to $5,911,000, and despite the very unsatisfactory condition of its markets, notably lead, the company ought to be in a position to make some dividend announcement in September."

British Columbia Copper Company.

First, as to the increase of gold shown in recent reports published relative to results obtained by the British Columbia Copper Company; probably this is due to the fact that the company has during June and July been smelting ore from its Wellington group mine, in which gold is the chief constituent of value, as well as copper ores from its Mother Lode and Oro Denoro mines. In June approximately 1,500 tons of Wellington mine ore was shipped to the smeltery, that having been the first month in which ore from that source was received at the company's works at Greenwood. Now, information obtained when I visited the mine last winter was to this effect—the greater part of the ore up to that time opened by development workings was oxidized and contained practically no metal of value other than gold, which, was stated to run from $6 to $7. per ton. In places bunches of sulphide ore, arsenical iron pyrites, had been found, some of these comparatively large; from this ore assay returns up to $20 per ton and even better had been obtained, chiefly in gold, but with about 2 per cent. copper. Allowing that 1,500 tons of oxidized ore had been smelted in June, this would probably add $9,000 to $10,000 to the value of gold recovered in that month. It may be, though, that these figures are high for June, since it is not unlikely the tonnage of copper ore smelted that month was reduced proportionately. Again, a little gold occurs in association with the copper, so that allowance should be made for this as well. These comments are not intended as a precise statement of the amount of gold recovered by the British Columbia Copper Company, but to indicate what is probably the chief factor in the improved situation alluded to by "The Globe." Since the Wellington group mine shipped about 2,500 tons of ore in July, it will easily be seen that returns for that month should show a still larger proportion of gold recovered, conditionally, of course, that the ore was smelted and not stored at the smelter.

Consolidated Mining and Smelting Company.

Now as to the larger percentage of gold shown in the returns of the Consolidated Mining and Smelting Company for the fiscal year ended June 30th, 1910, as compared with that of the immediately preceding fiscal year: if the tables printed in the Canadian Mining Journal of August 15th, be referred to (for my contribution on that date gave particulars of the opera-

tions and results of the company for its last fiscal year) it will be seen that the percentage of gold was 47.6, not 46.6 as stated by "The Globe." Without being informed as to the source of the larger proportion of gold produced at the company's big works at Trail, I state it as my opinion that most likely the increase, or most of it, came from the company's War Eagle mine, for it is well known that much ore containing a higher average gold value than usual was discovered in that mine during the fiscal year under review. It is worthy of note that the tonnage of ore from the company's Centre Star group of mines at Rossland, which includes the War Eagle, was 194,013 for the year to June 30th, 1910, as compared with 183,040 tons for that to June 30th, 1909, and it seems reasonable to conclude that the War Eagle contributed its share to the increase shown, and that of ore carrying a higher value in gold than in the preceding year mentioned. But apart from the question of the proportion of gold in the total value of metals produced during the year, the importance of which can only be properly determined by an analysis in detail of the several conditions which led to that result, there are two plain facts warranting much satisfaction with the progress made during the past fiscal year, at least as viewed from an industrial point of view. These are that (1) the tonnage of ore received was 485,457 tons in 1909-10, as against 347,417 tons in 1908-09, and (2) that there was substantial increases in gold and copper recovered, which left a considerable margin in value above the decreases in silver and lead. The quantities of metals produced in the respective fiscal years are shown in the following table:

	To June 30th, 1909.	To June 30th, 1910.
Gold, ounces	114,929	137,614
Silver, ounces	2,443,475	2,162,408
Lead, pounds	43,675,077	42,365,816
Copper, pounds	4,637,631	5,974,959

These figures show that against a loss of approximately 1,300,000 pounds in lead and 280,000 ounces in silver, there was a gain of nearly 22,700 ounces in gold and 1,337,000 pounds in copper, the final result being a gain in value of $406,000.

General Conclusions.

Speaking generally, I do not know of any changes in conditions that warrant an assumption or conclusion that there has lately been a definite improvement—that is, increase in average value—of ores mined in British Columbia. There will, of course, from time to time be changes in value of ores mined in the larger mines of the province, except in such cases as the Boundary mines from which thousands of tons of ore are taken daily. There will, also, be improvements in mill and smelter returns, the result of the use of machinery or metal-saving appliances better adapted for the recovery of the valuable metals contained in the ores treated; or, it may be, more efficient methods will be followed, so that the precentage of recovery is greater, but taking into consideration only the marketable metal contents of ores, no facts nor changed conditions have come to my notice that justify a belief or conclusion that the general run of ores mined in this province shows increased average values.

A few words in regard to the exceptions made in the foregoing paragraph—it may be added in explanation that in the case of the Granby mines, at Phoenix, the production of which over a period of seven months of the current year, to July 31st, has been on an average of 3,350 tons a day, or of the British Columbia Copper Company's Mother Lode mine, producing approximately 1,000 tons a day, the bulk mined and smelted is so large that the effect of shoots of ore of better grade being occasionally met with does not materially affect the general average value of the yearly production.

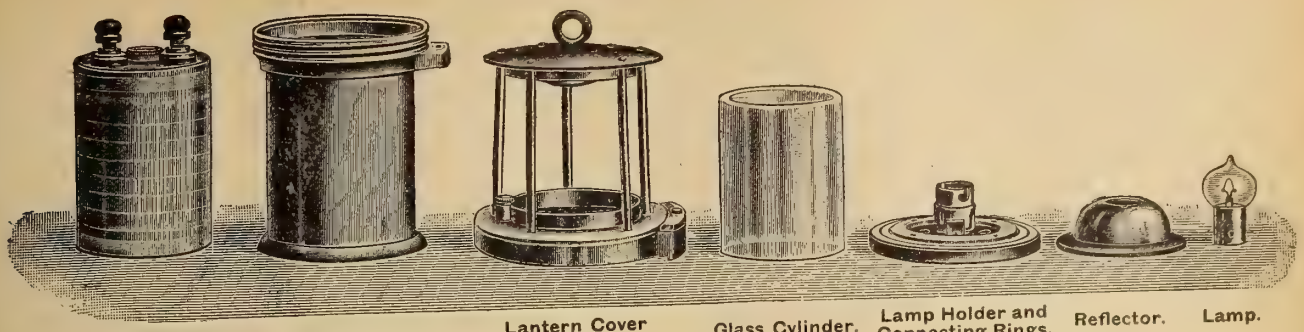
There are other instances, though, where different results are experienced, notably in such a case as that of the War Eagle mine, Rossland, where, as already intimated, a decided increase in value has been a gratifying experience within a period of probably less than twelve months. Not that such good quality ore had not previously been found in that mine, but that after the practical exhaustion of shoots found earlier, a large body of high-grade ore, the existence of which was not previously known, was found and is now being mined.

In closing, it may prove of interest to have an allusion made to the Nickel Plate mine, near Hedley, Similkameen. Eighteen or twenty months ago the then owners of that mine, which is the only comparatively large mine in British Columbia from which gold ore is being milled, were anxious to sell the property. A thorough sampling convinced a competent engineer, familiar with the mine, that it could be restored to a similar profit-yielding basis to that it had formerly occupied, so he unhesitatingly recommended its purchase by New York capitalists. To-day there is ore being mined from an ore body 80 feet in width and of an average value of $12 per ton. Further, improved milling practice and more efficient gold-saving appliances are together showing such markedly better results that this year's tonnage of ore mined and milled—should no unforeseen contingency arise to interfere with operations as now being carried on—will be at least 25 per cent. larger than in any previous year, while the average recovery of gold per ton will also be higher. To those who, like the writer in the Toronto "Globe," are not informed as to the reasons for such improvement in conditions, it may appear that higher-grade ore is being mined and milled, but to those who know the facts it is manifest that competent management and the utilization of improved methods and appliances are chiefly responsible for the decided change for the better that has been brought about.

CORRESPONDENCE.

The Editor, CANADIAN MINING JOURNAL.

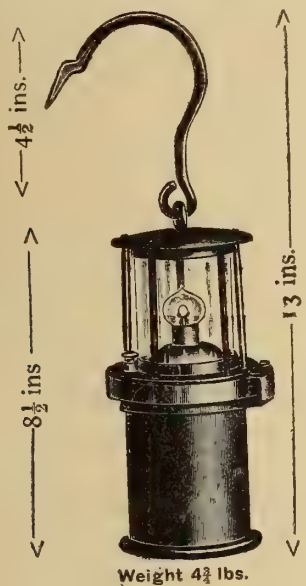
The phrase "intellectual proletariat" has been in use for many years in connection with the Socialist movement, but not at all in the sense in which you employ it, as denoting ineptitude or want of training. As used by Socialists it includes those brain-workers of all kinds who are dependent for their living upon their employment by others, and, therefore, should realize that they have common interests with manual labourers who are in the same position economically, notwithstanding that the latter receive "wages," while the intellectual proletariat draws a salary or commission.



Yours truly,

PHILLIPS THOMPSON.

119 Indian Road, Toronto,
August 18th, 1910.



The daily duty of the 1100-lb. stamp used at El Oro, Mexico, is 10.33 tons. The ore is crushed to 6-mesh or 8-mesh. The stamps drop eight inches, 101 times per minute.

INDUSTRIAL SECTION.

THE "GOOD LUCK" MINING LAMP.

The "Good Luck" miners' safety lamp is of the newest type of self-contained electric light. The casing is one aluminium casting free from zinc. It is threaded round the upper circumference and gives a substantial fixing for the lantern base, which is bored out and threaded to suit. Thus is formed a complete, dust-proof, gas-proof, and air-tight combination. A heavy glass cylinder, ground to suit exactly, is fitted as a lantern glass and protects the lamp from all possible injury. The lamp itself is one of the latest metallic filament tungsten lamps, taking one watt per candle power, as against four watts per candle power taken by lamps of this form with a carbon filament.

Accumulator.—The two negative electrodes and the one positive electrode that constitute the elements of the battery are especially strong and efficient. The positive consists of a heavy collecting frame in one piece and formed of longitudinal rings superposed at regular intervals. The frame thus formed carries the active material which is allowed to harden on it. By this arrangement not only is the manufacture of the collecting frame much simplified, but a battery of minimum weight and maximum surface is obtained, one that in its formation prevents disintegration. Of the two negative electrodes, each consisting of a double cast lead lattice cylinder, one fits inside of and the other outside of the positive. By this means the entire surface of the positive electrode is in action.

The accumulator is enclosed in a celluloid case, closed at the top with a double cover, and absolutely air-tight. Therefore the lamp can be operated in any position.

The lamp is locked by a magnetic lock and cannot be opened by any unauthorized person. It will burn for from ten to twelve hours with a discharge current of 0.75 amperes, giving a light of about 3 candle power. Orchard & Parker, Stair Building, Toronto, are the Canadian agents.

PAPER MILL PUMPS.

Capacity Equal to the City of Montreal Water Works.

The remarkable part played by pumping machinery in modern pulp and paper mills may be realized from the contract recently awarded by the Powell River Paper Company to the John McDougall Caledonian Iron Works Company, Limited, of Montreal. This contract calls for 11 Worthington centrifugal pumps varying in size from 3 inches to 12 inches at the discharge outlet. Two of these pumps, each having a capacity of 4,200 gallons per minute and driven by electric motors, will carry ground wood stock from the grinders to the screens. Two others, having a capacity of 4,000 gallons per minute each, and direct connected to water wheels, will carry ground wood stock to deckers. The remaining pumps will be used in connection with beaters and digesters and for boiler feed and general purposes.

These 11 pumps will have an aggregate capacity of 37,000,000 gallons daily, which is nearly equal to that of the city of Montreal water department, and will be built in the works of the company on William street. The Powell River Paper Company is backed chiefly by Minneapolis capitalists, and the mill is now being erected on the Powell River, a few miles from Vancouver, B.C.

The Jeffrey Manufacturing Company, office and works, corner Cote and Lagauchetiere streets, Montreal, Que., also having a Toronto office formerly in the Dineen Building, 8 Temperance street, has removed the Toronto office to more commodious quarters at 174 King street east.

Mr. H. W. Scott, mechanical engineer, formerly connected with the home office of this company in Columbus, O., is now in charge of the Montreal office and works.

The Jeffrey Manufacturing Company is an old, established concern, making a specialty of elevating and conveying appartus for handling all kinds of materials in lumber camps, mines, quarries, as well as conveying apparatus for handling materials from the docks, loading to vessels.

New machinery has been installed at the Montreal works for more economical production.

This company also has nearly 100 branch offices situated in the leading commercial centres all over the world.

PERSONAL AND GENERAL.

Mr. H. Mortimer-Lamb has returned from Europe.

Mr. W. S. Lecky has resigned his position as sales manager of Mussens, Limited.

Mr. John Hugh McMillan has been appointed Gold Commissioner for the Portland Canal Mining Division, B.C.

Mr. A. A. Hassan has returned to Brooklyn, N.Y., after a visit to Porcupine. Mr. Hassan will again visit Porcupine during September.

Mr. W. H. Trewartha-James, general manager of the Tyee Copper Company, Victoria, B.C., left that city on August 16th to proceed to the Ketchikan district, Southeast Alaska, on a business trip.

Professor Hardwick, professor of mining at Sheffield University, England, has been visiting mining districts in British Columbia. About the middle of August he was at Victoria, whence he proceeded to Nanaimo to see the coal mines there.

Mr. Sidney Clarke Ells, of Ottawa, son of Dr. R. W. Ells, of the Geological Survey, recently visited Queen Charlotte Islands. Five or six years ago he spent part Ells, of the Geological Survey, recetnly visited Queen Charlotte group, at the time his father was making a geological examination of coal measures there.

Mr. Mason T. Adams, formerly general manager of the Britannia Mining & Smelting Company, with a big copper mine on Howe Sound, near Vancouver, B.C., but now consulting mining engineer with headquarters at Denver, Colorado, recently went up to Portland Canal to investigate the mining situation in that district.

Mr. J. W. Bryant, who for three years has been mining engineer for the Tyee Copper Company, recently left Victoria, B.C., for England. During the first year of his association with the operations of the company he was superintendent of the Tyee mine, at Mt. Sicker, Vancouver Island, and since the practical exhaustion of the big ore body in that mine he has been engaged in examining mining properties for the company, covering an extensive field on the Pacific coast, from Mexico to Alaska, both countries included.

The Westinghouse Electric & Manufacturing Company has recently received an order from the La Blanca & Anexas Mining Company for forty type MS motors to be used in the company's mill at Pachuca, Mexico. The motors ordered range in size from 5 h.p. on the pulp thickeners to 75 h.p. on the tube mills. The order also includes seven 250 k.v.a. O.I.S.C. transformers, and one 12-panel switchboard.

The American Society of Engineering Contractors, of which Mr. D. E. Baxter, of 27 William street, New York City, is president, and Mr. D. J. Hauer, secretary, will hold their annual convention in St. Louis, on September 27th, 28th and 29th in the coliseum. The local committee of arrangements is E. H. A. Badie, chairman; J. L. Westlake, W. C. Swartout and L. C. F. Metzger. Papers will be delivered by J. B. Goldsborough and Ed. Wegmann, both of New York, on "Dam Construction for City Water Supplies," and by Geo. C. Warren, of Boston, on "Work Preliminary to Street Paving and Road Work." A banquet will be held, and several sight-seeing trips will be made to important engineering works in and around St. Louis.

The American Peat Society, through the efforts of President Dr. Eugene Haanel, Director of Mines, Department of Mines, Canada, held a series of meetings from July 25th to July 27th at Ottawa. The Canadian Government has a fuel testing station at Ottawa, which is equipped for the testing of power purposes for peat only. The power plant consists of a double-zone peat gas producer, wet coke scrubber, tar filter and dry scraper, a 4-cycle single-acting Keating gas engine of 60 effective horse power, a 50 k.w. direct-connected Westinghouse direct-current generator, and a resistance stand for absorbing energy generated. The power generated at this station will later be utilized in running the machinery of a metallurgical laboratory. The peat for the operation of the producer will be supplied from the peat bogs owned by the Dominion Government, near Caledonia Springs, about 40 miles distant from Ottawa, and has an area of about 300 acres. The Anrep process for manufacturing air-dried peat is employed, the plant installed having a capacity of about 30 tons per day of air-dried peat.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Dominion Coal Company, Limited, Employees' Benefit Society.

The new society is now in full operation, and a committee has been nominated to wait upon the Nova Scotian Government in Halifax and lay before them a statement of the work which it is hoped the society will perform. It is believed that the committee have a very good case to lay before the Government, and have excellent grounds for requesting a continuance of the grant which has been made in the past to the Colliery Relief Societies. On the 1st of July the accumulated assets of the various relief societies which have amalgamated to form the Dominion Coal Company Employees' Benefit Society amounted to, roughly, $47,000. The Dominion Coal Company has made an initial contribution to the society of $21,000, making a total fund of $68,000. It is estimated that the liabilities of the society for payments to widows and orphans already dependent on the funds amount to $24,000, which leaves the new society with an actual surplus of $43,000, with which to begin what everyone hopes will be a long and beneficial life.

A comparison of the benefits which will be given under the new schedule with those given under the constitutions of the old relief societies shows that the provisions which will be made in future for incapacity or death of the bread-winner will be very much more adequate. Under the old schedule a man incapacitated from work either by sickness or accident received $3.50 per week for twenty-six weeks; at the expiration of which period the extent of further relief allowance was decided by the managing committee. Under the new schedule, men similarly incapacitated will receive $6 per week for twenty-six weeks, $3 per week for a further period of twenty-six weeks, and then $2 per week for the two years following; after which, if the disability continues, it is in the power of the officers to make special grants in deserving cases. Under the old schedule, the death claim varied from $60 to $100. Under the new schedule, the amount immediately payable at death to dependents will be $100. It is not intended that this amount should be in any way analogous to a death payment under the ordinary insurance society or under the Compensation Act, but it is intended merely to cover the immediate necessities connected with interment. Adequate provision is made for widows, who, under the new schedule, will

receive $8 per month for five years, compared with $8 per month for one year only under the old schedule. The sum of $3 per month is allowed for each child until it reaches the age of fourteen years; under the old schedule the allowance was $2 per month until the age of thirteen years. In addition to the foregoing benefits, provision is made for special grants to members partially or totally incapacitated by the loss of eyesight or limbs. These special grants are in all cases in addition to the regular weekly indemnity. These much-extended benefits require, of course, a larger income, and the workmen have increased their monthly contribution from 25 cents to 50 cents per man. The company has agreed to contribute equally with its men; that is, it will pay into the funds of the society monthly an amount equivalent to that collected from the workmen. The Nova Scotian Government have contributed in the past to the relief societies three-tenths of a cent per ton raised, which is equal to, approximately, 12 cents per month per man. Therefore, the society will have an income of about $1.12 per month per man. The rules of the society make no distinction between sickness and accident, and the records of the past show that only one-third of the money paid in relief has been disbursed for accidents, while two-thirds has been paid out for relief during sickness. It is calculated that in the case of a normal family, consisting of the mother and four children, they would, in the event of the death of the bread-winner from any cause, receive in relief payments approximately $2,000, extending over a period of ten or twelve years.

The aim of the society is, in case of incapacity for work or death, to provide for those dependent upon weekly earnings a system of relief which shall approximate as nearly as possible to the normal conditions under which a workman receives his income, and to avoid what is one of the worst features of some forms of industrial compensation, namely, the payment of comparatively large sums of money to persons not accustomed to its possession. The relief payable is based on the necessity, being graduated according to the size of the dependent family.

Considerable attention and care has been paid to the framing of the constitution of the new society, so that it may have a long and useful life and properly carry out the very needful purpose for which it is designed, and the committee who are deputed to interview the representatives of the Government have no reason to be ashamed of the society they represent, which should have the hearty co-operation and commendation of all who are sincerely interested in the welfare of those employed in the mining industry.

Glace Bay.—The outputs of the collieries this summer have been consistently high, but for the first half of August the production has been considerably interfered with by the holiday season. The large production of the mines during June and July was partly accounted for by the fact that the returned strikers were in need of money, but now that the pinch has passed away, the men are not working so regularly. Prospects for the winter shipping are, however, by no means good, and the wise man will make all the wages possible before the close of navigation. One of the strongest arguments against strikes is that trade lost through the cessation of production is difficult to regain, and there probably never was a case where men had more to lose and less to gain by striking than those Nova Scotian miners who were brought out on strike on the order of the United Mine Workers of America. As was intended, the strike has worked permanent injury to the coal trade of Nova Scotia.

Recent events have shown that the Canadian workman is awaking to the fact that international unionism and the cessation of work at the edict of some labour leader in the United States is working great harm to the industrial interests of Canada. There is a striking similarity between the Grand Trunk strike and the U. M. W. A. strike at Glace Bay, and in every case where Canadian unionists have allowed themselves to be dominated by strike leaders from the States, it has been the Canadian workman who has lost his work and his savings. There was the trouble in British Columbia in 1903, brought about by the so-called Brotherhood of Railway Employees; the C. P. R. machinists' strike, the abortive U. M. W. strikes in Alberta and British Columbia; the U. M. W. strikes at Inverness and Glace Bay, and the Grand Trunk strike, which is so recent in memory. In every case the tale has been the same. The direction of affairs has been in the hands of strangers from the United States, unacquainted with local conditions; the peculiar intimidatory tactics of labour warfare in the United States have been introduced to the uncongenial laws of Canada, the strike funds have been wasted in riotous living and "rake-offs." Then, when irremediable harm has been wrought to the industry affected, and the savings of the men who have followed their careless leaders have been entirely dissipated; when hitherto law-abiding men and women have undergone the indignities of jail incarceration and the inevitable demoralization of mob-rule and license, these "international officers" negotiate a so-called "settlement" or they advise their deluded followers to return to work. The final upshot is that many of the strikers cannot get back their old employment, as their places have been filled by newcomers, and they have perforce to seek a fresh employment and a new residence, if by good luck they may obtain such. Long before this the gentleman from Columbus, Ohio, Indianapolis, or some city of the United States, has returned to his native air, sleeker in person and fatter in purse, and possibly secretly amused at the gullibility and ingenious enthusiasm of the Canadian workman, for their is no doubt these gentlemen possess a sense of humour.

The P. W. A. Picnic.—All the collieries were idle on the 13th of August, on which date the Provincial Workmen's Association held their annual picnic. By the courtesy of the Coal Company, free transportation was granted to the members of the society and their families from the mines to Sydney, from whence they were conveyed by the Coal Company's steamers to Baddeck, a sail of about one hundred miles up the Bras d'Or Lakes. The picnic party was quite a large one, numbering in all some 4,500 people, and the inhabitants of peaceful Baddeck must have been pleasantly surprised at the orderly behaviour of this immense crowd and their prosperous appearance after all that has been written in Nova Scotian newspapers about the oppressed and desperate condition of the miners in Cape Breton before the United Mine Workers of America came to their rescue. The picnic was a demonstration of the strength of the P. W. A. which was worth while, and we think this large gathering of miners and colliery employees compared favourably in all the outward aspects of intelligence and prosperity with any similar gathering either on this continent or across the water. It says a good deal for the self-control and the law-abiding character of the native organization that, throughout all the long period of contumely and intimidation to which they were subjected through the U. M. W. strike at the direction of the foreign officers of this alien organization, they did not once indulge in reprisals but went about their own business in the manner they thought best, which, after all, is what most Canadian working men desire and intend to do.

QUEBEC.

Considerable interest has been excited by the development of the copper deposit located on Lot XXII, Range II, Weedon, and about five miles northeast from Weedon station. The property was purchased from "Jack" Macdonald, of Sherbrooke, about a year ago, by Mr. John R. Allan, of New York, and work was commenced during the past winter. The plant consists of one two-drill compressor, two rock drills, one steam hoist and boiler and diamond drill. Shaft with mainway has been put down to one hundred and ten feet on an angle of about 45 degrees, following the footwall, and at this depth the vein is drifted on to a distance of about one hundred and sixty feet to the southeast and about two hundred and thirty feet to the northwest. At the bottom of the shaft a crosscut has been driven through the

ore body to a thickness of about forty feet. In the northwest drift and at a distance of about two hundred feet a diamond drill hole has been bored along with the vein to a further depth of two hundred and fifty feet in ore of same quality as found in drifts and shaft. A sample of ore from the northwest drift gave the following assay:

Gold	None.
Silver	1.6 ounces per ton.
Copper	14.76 per cent.
Iron	35.6 per cent.
Zinc	5.99 per cent.
Sulphur	41.23 per cent.

The deposit occurs in the sedimentary rock and the frequent granite extrusions apparently account for the deposition of the ore, and the country rock is more or less mineralized over a large area. About a mile distant occurs a range of eruptive hills and towards these hills and to a distance of several miles are found similar copper showings which promise well for the location of other valuable deposits.

The work at the mine has been carried on with energy and by practical men, who are highly gratified by the results so far obtained.

ONTARIO.

Cobalt.—Dividend figures for the first half of the present year show that three Cobalt companies have already redeemed their capital and that several others have almost reached that point. Nipissing has paid 87 per cent. and the cash on hand is more than sufficient to pay the other 13 per cent. on a capital of $6,000,000. In addition to this the ore reserves are larger than ever before and new ground is constantly being opened up. A large portion of their area is still practically untouched, and the probability is that other rich discoveries will be made. Although the Crown Reserve has been shipping only about two years and a half, it has paid 106 per cent. on a capital of $2,500,000. The cash reserve amounts to practically half a million and new discoveries have lately made a material increase in its ore reserves. The T. & H. B. has paid 16,300 per cent. in dividends, but this is due to the extremely low capitalization of $7,761. In addition the greater part of the dividends were paid with money received from the sale of the Silver Queen property. Other companies, such as the Buffalo, Kerr Lake and McKinley-Darragh, have made large dividend disbursements, and are still in a very strong position. During the last few months many important discoveries have been made, which will largely increase the ore reserves. The majority of these new veins were found underground.

The Dr. Reddick Larder Lake mines have gone into liquidation, and a meeting of the creditors was held in Ottawa on August 5th to settle the affairs of the company. This property was the best known in the Larder Lake district and also had the best showing. A considerable amount of work was done on it, but the results were not satisfactory.

The T. & N. O. Railway has started a passenger service on the Kerr Lake branch and is running two trains daily each way between Cobalt and the end of the line. This service fills a long-felt want, as the facilities for getting out to the mines of this section were formerly very poor. It is understood that the Nipissing Central will also build a spur line to the same section of the camp.

In order to develop the big smaltite vein found on the Fisher-Eplett some time ago a crosscut is being run from the 200 foot level of the Shamrock shaft on the adjoining property. Two promising veins have already been cut in this working, but they carried low silver values. On the Princess property, which also belongs to the La Rose Consolidated, a new vein has been found at the 130 foot level about 160 feet south of the shaft. It shows about five inches of high grade ore and is considered the best vein discovered on the property. This will make three high grade veins that are now being worked.

A new high grade vein has been found on the Townsite property near the Buffalo boundary. It is about two inches wide and in addition the wall rock is well mineralized.

Reports from the Mattagami Iron deposits are encouraging and Professor Baker, who reported on them for the Government, was very favourably impressed. Another exposure of ore has been found and has been traced for about 1,000 feet. It is a high grade of iron and suitable for all commercial purposes. In addition to many syndicates who are interested, the U. S. Steel Corporation and Mackenzie & Mann have engineers in the field.

On the Russel claim in the Gillies Limit a considerable amount of trenching has been done this summer and several promising veins have been discovered, although the silver values are low.

The O'Brien, Nova Scotia and Temiskaming lately made another shipment of bullion to England, consisting of 110 bars weighing approximately 98,000 ounces. The shipments of bullion from Cobalt to date are as follows:

	Ounces.
O'Brien	174,666
Buffalo	68,500
Crown Reserve	15,931
Nova Scotia	46,700
Temiskaming	40,000
Total	345,797

In the United States Circuit Court a memorandum has been filed denying the motion of H. M. Hitchings on behalf of himself and other stockholders in the Cobalt Central against Messrs. Nevins, Maloney, Eldredge, Eakins and the Standard Cobalt Mines, Limited, for an order directing the defendants to withdraw the proceedings instituted by them in Toronto for the liquidation of the Standard Cobalt Mines, pending the result of action now in the Circuit Court for that district.

A report recently submitted to the directors of the Crown Reserve stated that although the mine had produced 8,000,000 ounces of silver, the ore reserves were greater than at any time in its previous history. The new vein found 900 feet up the lake has the best showing on the 200-foot level. A raise has been put up eighty feet and it shows high grade ore all the way.

The big mill on the O'Brien property is credited with making an extraction of 90 per cent. of the silver contents of the ore. The total cost, including tramming and marketing charges, is fourteen cents per ounce. Three different products are obtained, jig concentrates, table concentrates, and the product from the cyanide plant. The first two are shipped to the smelter as high grade ore, while the latter is melted down into fine silver bullion which is shipped direct to England.

The drop in Kerr Lake stock is due to the rumour that the next dividend will be at the rate of forty cents per share instead of the usual fifty cents.

At the Reeves Dobie property in Gowganda the ground has been cleared and the new concentrator building is being erected. The machinery, part of which is already on the road, consists of four Nissen stamps, and six tables. This will be installed as rapidly as possible. During this summer the Millerett has shipped three car loads of ore down the Montreal River. Two more car loads are ready sacked in the ore house, but on account of the heavy transportation charges will not be shipped until next winter. The total tonnage of ore shipped from Gowganda and Elk Lake was 436 tons. A new discovery has been made on the Morrison. The English syndicate did not take up its option on the property, and it is now being worked by the original owners.

Mr. E. P. Earle, president of the Nipissing and a director of the La Rose, states that no new steps have been taken in the proposed Cobalt Merger. He was enthusiastic over the recent developments in the Nipissing, where some exceedingly fine ore has been opened up in the Mayer, No. 64 and No. 122 shafts. In the No. 64 on the 270 foot level the vein will average over a foot of high grade ore.

Porcupine.—Two companies are now in the field to generate electric power for the mines, and it is expected that they will have it ready by June of next year. It is probable that the length of time necessary has been under-estimated and that it will take considerably longer. Mr. E. A. Wallberg, head of the Mines Power Company of Cobalt, will erect one plant, having an estimated capacity of 7,000 horse-power, while Messrs. Bilsky and Symmes have obtained a lease on Sandy Falls in Mountjoy Township, where they expect to generate 4,000 horse-power.

The plan of building the dam at the mouth of Frederickhouse River, in order to raise the water so as to allow the running of gasoline boats, has been abandoned. The Government caused this work to be stopped, and although permission to continue was subsequently given, the restrictions were such that the promoters decided not to go on with it.

Another new section known as Cripple Creek is coming in for a good deal of attention. It is about thirty-five miles southwest of Porcupine and some very good discoveries are reported to have been made.

Work has been started on the seventeen Dobie claims purchased by Mr. Lorne McGibbon and associates. A large number of quartz veins have been discovered and some of these show free gold. Twenty-four men are now working and this number will probably be increased when supplies are cheaper.

The maps and reports of a limited section of this district, which were made under the supervision of Professor Miller, Provincial Geologist, have been completed. Three maps have been issued. One takes in the townships of Whitney, Tisdale, Deloro, Shaw, and part of Mountjoy and Ogden, embracing an area fifteen by twelve miles, while the two others show particular areas in Tisdale, one being a section near Miller Lake and the other the country near the Dome and Foster properties. The report states that the quartz outcrops, which are very numerous, are found in rocks of both Keewatin and Huronian periods and that the age of the rocks does not appear to have any bearing on the character of the veins either as regards form or gold content. One characteristic of the veins is that they are irregular as to width. They will widen out into large masses of quartz, sometimes one hundred feet in width, and then narrow abruptly. The geology of the country has been worked out as rapidly as possible and the maps will doubtless be inaccurate in some of their details. The Department, however, considered it would be better to publish them as soon as possible, when they would be of most service. During the rest of the summer the field work will be extended and new maps will be issued during the winter.

BRITISH COLUMBIA.

Mr. Wm. Fleet Robertson, provincial mineralogist, returned to Victoria on August 11th from an exploratory trip in Chilcoten district. Shortly afterwards he went to Lillooet to obtain information relative to mining operations and the prospects of the industry in that district.

Captain Desborough, of the Explosives Department of the Home Office, London, accompanied by Mr. Joseph G. S. Hudson, of the Mines Branch of the Dominion Department of Mines, Ottawa, has been visiting British Columbia. At Nanaimo, Mr. Hudson stated, according to a local newspaper, that Captain Desborough had come to Canada at the request of the Dominion Government to make an examination of, and advise as to the law in Canada regulating the manufacture, use, and testing of explosives. In this connection, it is understood that a bill is being prepared under the direction of Hon. Wm. Templeman, Minister of Mines, to provide for the regulation of the manufacture, etc., of explosives, in which the Mines Branch is interested, owing to there being many accidents in mines in the Dominion due to premature explosions or other results of the use of explosives. It is further stated that at the conclusion of Captain Desborough's tour the Minister of Mines will arrange for holding a conference of those more particularly interested—manufacturers of explosives, representatives of departments of mines, and others—to submit for their consideration a draft of a bill prepared as above suggested.

Cariboo.—Mr. John B. Hobson, who for many years conducted hydraulic placer-mining operations on a large scale in the Quesnel Forks section of Cariboo district, has been visiting placer-gold mines in the vicinity of Barkerville, Cariboo division. It is stated that he has purchased from a well-known miner a placer mine situated on Chisholm Creek, near Stanley.

Slocan.—The management of the Lucky Jim mine, near Bear Lake, is energetically preparing for a resumption of ore-shipping. Fifty men are employed putting in order the old wagon road from Three Forks to Bear Lake, a distance of three and a half miles, so that materials for reconstruction of buildings, ore-bins, tramways, etc., can be hauled to the mine. Men are also working at the mine getting things in readiness for production so soon as it shall be practicable to haul ore to the railway at Three Forks for shipment thence to the United States. At the Rambler-Cariboo mine, too, there is activity, supplies having been taken in by pack-horses. The wagon road from Three Forks will also serve this mine until railway transportation shall again be available. The lessees of the Whitewater group of mines and the representatives of the English companies owning these properties met recently in Vancouver, but there will necessarily be delay in determining what shall be done towards providing for resuming production, owing to the fact that some of those chiefly interested reside in England, while the lessees are in British Columbia.

Work at mines about Sandon and Cody is being continued without interruption. The largest producer in this part of the district in 1909 has been the Consolidated Mining & Smelting Company's Richmond-Eureka mine, which has shipped to Trail about 2,600 tons of silver-lead ore. The Standard, on Four-Mile Creek, Slocan Lake, has made an output of about 900 tons of sorted silver-lead ore, while the Van Roi has sent to the Wakefield mill for concentration a comparatively large quantity of silver-lead-zinc ore. Both the Ellis Silver Mining Company's Eastmont mine, on Ten-Mile Creek, and the Mollie Hughes, near New Denver, have been small shippers this year.

Rossland.—Although the big power plant over the Le Roi main working shaft is not now being used, miners are taking out ore from near the old Le Roi shaft, and there is a good prospect of their being similarly employed for several weeks longer. Air for operating machine drills, etc., is being obtained from the Le Roi No. 2 Company's compressor. The ore is sent to the Consolidated Mining & Smelting Company's smeltery at Trail.

Besides having a big shoot of ore containing good value in gold in its War Eagle mine, the Consolidated Company is mining and shipping ores from both the Idaho and Iron Mask of the Centre Star group. Le Roi No. 2 is regularly maintaining production from its Josie mine, sending the first-class ore to Trail for smelting, and putting a smaller quantity of second-class ore through its concentrating mill.

Nelson.—The mines in Nelson mining division sending ore to the smeltery are the Queen Victoria, near Nelson; Yankee Girl, at Ymir; Emerald, at Salmo, and several others which are producers on a smaller scale. The Granite-Poorman, near Nelson, and the Queen and Nugget, in Sheep Creek camp, are operating stamp mills on gold-quartz ore. Late reports from Sheep Creek give accounts of increasingly favourable developments on several properties, notably on the Nugget and Mother Lode. The last-mentioned mine is being worked by Mr. John McMartin, formerly of Cobalt, whose engineer is credited with the statement that on the fifth level, which has been driven about 700 feet, the vein has been encountered at a depth of 480 feet from the surface. This development is stated to be regarded as satisfactory and quite up to expectations, the ore maintaining both its width and average good quality.

Boundary.—A disastrous fire occurred at the Granby Company's No. 3 tunnel on August 12th. Practically all the sur-

face works of this unit—there are four shipping units at these mines, three being on the Knob Hill Ironsides and one on the Gold Drop side of the mountain—were destroyed. Unfortunately, the destruction of shipping facilities at No. 3 will temporarily reduce the output so that it will be necessary to reduce the number of blast furnaces to be kept in continuous operation at the company's smeltery, from six to four. Production had been at the rate of about 3,000 tons per diem, and this gave a sufficient supply for six furnaces. It is hoped, though, this decrease in the ore supply will prove temporary and not affect operations for long. No. 2 tunnel and the Gold Drop unit are both connected with the Canadian Pacific Railway only, while the output from No. 3 was shipped over the Great Northern Railway. Both railways are connected with the shipping bunkers at Victoria shaft, so it will still be practicable to ship some ore by the Great Northern. The loss of property from this fire included new machine and blacksmith shops erected last winter, crusher house and plant, and two residences, one of which was that of the mine superintendent, Mr. O. B. Smith, Jr. A rough estimate of the loss places that of the mining company at about $100,000, part of which will, however, have to be borne by insurance companies.

District newspapers state that work is to be done with the diamond drill at the British Columbia Copper Company's Wellington group mine, from which ore has been shipped of late. Production was commenced about the beginning of June, and since then some 5,000 tons of oxidized ore has been shipped to the company's smeltery at Greenwood. The chief valuable constituent of this ore is gold, which has been stated to average $6 to $7 per ton. Development work done prior to the recent completion of construction of a spur from the Eholt-Phoenix Railway has made available a considerable quantity of ore; further prospetcing, with the diamond drill, is expected to prove the occurrence of other ore bodies not yet reached.

Similkameen.—The ore body in the upper workings of the Hedley Gold Mining Company's Nickle Plate mine is approximately 20 feet in width and of an average value of $12 per ton in gold. In the lower adit, two ore bodies are being opened by north and south drifts. To provide for the conveyance of ore from this lower adit a branch electric tramway is being constructed from the main tramway between the old workings and the 40-stamp mill at Hedley. The new tramway will afford better facilities for conveyance of ore, the grade being easier than on the main tramway above the point of junction of the two lines. It is probable that ore from the old workings will also be taken out over the new line, after the necessary connections shall have been made between old and new workings. On the Bulldog claim of the Nickle Plate group an ore shoot 25 to 35 feet in width is being opened. Additional equipment is being installed at the stamp mill and cyanide plant, including tube mill, Deister concentrating tables, a circular filter press, and other appliances to assist in making a closer saving of gold.

Coast.—At the Great Granite Development Syndicate's Lucky Jim mine, on Valdes Island, a power plant, lately put in, is now being operated. This consists of an 80 horse power h.r.t. steam boiler, half of a Canadian Rand 15-drill air compressor, two 3¼-inch machine drills, 7x10 double cylinder Lidgerwood hoist, and all accessories. The plant is housed in a 40 x 60-foot frame building covered with corrugated galvanized iron and having room for a second boiler of like size, and the other half of the compressor when these additions shall be needed. A 40-foot gallows frame, with a 9-ton ore-bin or skip pocket, has been erected over the shaft, which is 115 feet in depth. At 105 feet drifts are being run both ways from the shaft in an ore body 8 feet in width so far as opened. The mine is situated about three miles from tidewater, communication being a short distance by tramway to a logging road and thence by the road to the sea. Shipment of ore to the Tyee Copper Company's smeltery at Ladysmith, Vancouver Island, will shortly be in progress.

News from Portland Canal is generally to the effect that on several properties development work is being done, and with promising results. The great harm done the new district by the sending out of such grossly-exaggerated statements as were freely published a few weeks ago, has been recognized, and now even newspapers that were among the chief sinners in the direction of disseminating the absurd stories to which publicity was given are now protesting the folly of such a damaging course. The Portland Canal Mining Company expects to soon commence concentrating ore at its mill, the first unit of which is nearly completed. Good accounts also come of the prospects of the Red Cliff mine, which is stated to have a large surface showing of copper-gold ore, to cut which at depth work is now being done. The excitement over Portland Canal has driven most of the prospectors from the Skeena country, but there are such promising indications in various parts of that big district that its mineral resources will not long be neglected.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax.—The Libby gold mine at Brookfield is to be pumped out and operated. Two or three prominent Canadians have formed a syndicate to tackle the mine. Mr. Percy Brown, formerly assistant manager of the Boston-Richardson, is the moving spirit.

Bass River.—A group of Oxford investors has taken hold of the abandoned silica (infusorial earth) deposit and plant here. Much energy is being displayed and there is ground for the belief that the venture will be successful.

QUEBEC.

Montreal.—The appearance of Superintendent Denis' Annual Report of Mining Operations has aroused much interest. In noting the falling off of mica and asbestos the general opinion is that this is only a temporary phase and that both industries will pick up rapidly. Asbestos, of course, is in a far different position from mica. But the same cause, namely, overproduction, has affected both minerals.

Further developments in copper are expected. Mr. Denis alludes in his report to the possibility of working several copper deposits successfully on a large scale, and he draws a very instructive parallel between the known Quebec deposits and certain copper mines of the United States.

ONTARIO.

Ottawa.—The Dominion Government has undertaken an investigation, under the auspices of the Mines Department, for the purpose of framing a law for the regulation of the manufacture and use of explosives, with a view to securing the greatest degree of protection possible to those who have occasion to handle them. Attention has been directed to this subject by the heavy list of accidents and loss of life which have occurred in places where explosives are used, an instance of this being cited in the fact that 114 men lost their lives on construction work on the National Transcontinental Railway alone during the past three years from this cause.

Capt. Desborough, inspector of explosives at the naval arsenal, Woolwich, has been engaged to conduct the investigation, and is now on the west coast for the purpose of consulting the British Columbia government.

Capt. Desborough has visited all the explosive factories in the

Dominion with the exception of two, and is confident that the death rate can be greatly diminished by a larger use of black powder, which he believes to be as efficient as the higher explosives in the ordinary work, particularly in railway construction and in such work where the operators are confined to limited space in which to seek safety. This has been found to be the case in Nova Scotia, where the fatalities have been reduced to a very small per cent., only three men having been killed or injured there during the past year.

The great object of the government, Capt. Desborough says, is to regulate by act the manufacture of powder in Canada the same as in England, where the regulations in this respect are the best in the world. The government also has in view a federal mining act, as well as a federal explosives act, whereby the authorities will be able to investigate all accidents in mines. A movement of this kind, he states, is also on foot in the United States, the mining inspectors having petitioned that government to take all mining matters under control, which action, they consider, would tend more to the safety of the employees in the mining industry.

At the conclusion of the tour by Capt. Desborough, the Minister of Mines at Ottawa, will call a conference of the manufacturers of explosives in Canada and the mining departments of the province, at which a draft of an explosives bill will be submitted.

Capt. Desborough states that he has received every courtesy from the managers of the various works visited, and believes he will have their hearty co-operation in the movement started for the better protection of the men required to use dangerous explosives in their work.

BRITISH COLUMBIA.

Nelson, B.C., Aug. 13.—The most disastrous fire that ever visited Phoenix, broke out to-day in No. 3 oil-house of the Granby Consolidated Mining & Smelting Company. No. 3 crusher building was also soon in flames, and sparks set fire to houses in the lower streets of the town, including the Methodist and Presbyterian churches, public school, Pioneer printing office, several residences and the new machine shops of Granby, all of which are reported to have been destroyed.

For a long time, it was feared that the whole town would be in flames, and a train crew with a passenger train was delayed in readiness to carry people out of the city.

Panic prevailed and many houses were emptied of furniture. After a strenuous fight the firemen gained the victory and the fire is now said to be under control.

Vancouver.—Among the visitors to Bowen Island on August 14th were Captain Desborough, chief of the explosive testing station at Woolwich arsenal, and Mr. J. G. S. Hudson, of the Department of Mines, Ottawa. They did not go up on a pleasure trip, but to inspect the powder magazine there, having only just returned from Vancouver Island where they inspected the powder and dynamite plants.

The proposed Canadian legislation will be based on the English Explosives Act, which has been found highly instrumental in decreasing the danger from the use of explosives in the British Isles. Last year in Great Britain fifteen thousand tons of explosives were manufactured for mining purposes, and there were only three accidents, none of them with fatal results.

Captain Desborough and Mr. Hudson left last night for the Crow's Nest Pass where they will examine some of the collieries, particularly one in which there was an explosion from "dust" a few years ago.

Victoria, B.C.—Capt. Desborough, inspector of explosives at the government arsenal at Woolwich, was here early in August. He came to Canada in connection with the legislation dealing with explosives which Hon. Wm. Templeman intends to introduce in parliament next session. It will be based upon legislation in force in Great Britain and European countries, which has proved very effective.

Phoenix, B.C., Aug. 18.—Mike Bauer and D. Hainan were running a machine at Snowshoe mine, when without warning, a large quantity of rock caved in, carrying men and machinery down the slopes below. Both bodies were recovered in a frightfully mangled condition. Both were experienced miners. Bauer has a brother in Milwaukee; Hainan, a Finlander, leaves a wife.

YUKON.

Dawson, Aug. 16.—The Yukon Territory has shipped to the outer world $150,000,000 in virgin gold. The greater part of this has been produced within fifty miles of Dawson, and perhaps 90 per cent. within one hundred miles.

While some of the other camps of the North are falling off in output, the Klondike camp is increasing its yield. This is due to the fact that the Klondike placers on the creeks are not so deep that they cannot be dredged, and those on the benches can be worked by hydraulic. On many of the rivers the gold also can be recovered by dredging.

Klondike's output is actually increasing, whereas some of the other camps are experiencing a falling off in yield. The output of this camp last year was $4,000,000 and this year it is expected to reach $5,000,000. Possibly the pace will be maintained for years. The extensive operations of the Yukon gold are to be rivaled by those of a giant new company now entering the field headed by A. N. C. Treadgold. Two or three other big companies are in the field with dredge companies, and two or three others are investigating this season with prospects of coming.

The hundred and fifty millions mentioned as produced to date has come chiefly from Bonanza, Eldorado, Hunker, Dominion, Sulphur, Gold Run, Quartz and other such well-known creeks and tributaries within fifty miles of Dawson. In striking this total about $16,000,000 is allowed for at the conclusion of the statistical total to cover the random creeks of the Forty-Mile, Eagle, Woodchopper and Circle, and such streams which in early days were opened by men toiling in this region. Aside from this general summary the handsome sum of one hundred and twenty-five millions has been produced within the borders of the Yukon Territory proper—that is, the British Yukon—and the greater part has been turned out within the last ten years.

The official figures of the returns secured for the British Yukon are based chiefly on the royalty returns, which were collected in early days by crude methods, and dependent largely on the affidavits of claim owners as to their yield. Even then the gold was estimated at the low valuation of $15 an ounce, which probably was a dollar per ounce under the real average value.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

London.—In 1909 there were 1,659 coal-cutting machines in use in Great Britain, as against 1,493 in 1907, the quantity of coal obtained by the aid of machines being 13,590,359 tons, or 8,142 tons per machine. This represents one ton in twenty of the total coal output, as compared with one in fifty in 1902. In 922 machines compressed air was employed as the driving power, the remaining 737 machines being driven by electricity. These figures indicate that Mr. W. H. Pickering's (The Yorkshire mines inspector) statement that the use of coal-cutting machines in British mines will beat hand work at the coal faces will be borne out. Another government expert has expressed the opinion that coal-cutting machinery under the Act limiting the working hours of collieries in British mines to eight

hours a day will prove a powerful factor in the maintenance of coal output. The probability is that there will be a much larger number of coal cutters at work in British collieries within the next few years.

SPAIN.

San Sebastian, Aug. 17.—Serious troubles are expected in Bilbao Tuesday, since the strikers have refused to accept the half-hour a day reduction granted by the employers. The latter have informed the government that they will begin work in the mines immediately, as other miners not belonging to unions have agreed to accept their proposition.

This announcement disclosed the fact that the employers are holding strike breakers in reserve. The employment of such men, the strikers say, will cause them to resort to violence in spite of the army or police.

Premier Canalejas still hopes for settlement. The strikers are prepared to storm the building of the Provincial Deputation, which is, according to them, the stronghold of enemies of the people.

SERVIA.

A Belgrade despatch to the "Kolnische Zeitung" reports the formation as an English company of the Danube Mining Concession, Limited, which is said to be a mining bank constituted with the co-operation of the Commercial Bank of Scotland. The company has acquired land on the right bank of the Danube in Servia to the extent of nearly 500,000 acres, has established a branch in Vienna and also proposes to found a branch bank at Buda Pesth. Mr. John Allan and Mr. W. Carlyle, formerly general manager of the Rio Tinto Company, will, it is stated, assume control in September.

RUSSIA.

The latest decree issued by the Russian Minister of Commerce will be of great importance to speculation in petroleum, which has immensely increased since the announcement of the naphtha deposits in the Kuban district. It is stated in the decree that until further notice—which is said to mean until confirmation by the Ministerial Council—concessions for the acquisition of land by foreigners in the Caucasus are only to be granted in case they are ready to undertake borings there at their own risk, but the purchase by foreigners of lands already known as petroliferous shall not be permitted as being opposed to Russian interests. It is assumed in St. Petersburg that the decree aims at putting a speedy termination to the unsound promoting period in the Caucasus. The government obviously wishes that foreign interests which have completely turned away from the Baku naphtha region should again devote themselves to it; and, therefore, the entrance of foreigners into the Maikop district is rendered difficult. According to a declaration made by the Minister of Commerce, it appears desirable that foreign interests should be active in the granting of loans, which are to be made to Russian firms for boring purposes, and this could be accomplished by the taking up of obligations or shares. Nevertheless, the correspondent remarks that foreigners would do well to exercise great caution in the matter, as the naphtha content of the lands of most newly-formed companies has not been determined at all with certainty, and it is very doubtful whether the results will only approximately correspond with the expectations.

AUSTRALIA.

The aid afforded by the Victorian Government to mining prospecting operations within its territory might be followed with advantage elsewhere. The discovery of a new mining field is of such value to any young country that money expended with that object cannot be considered really wasted even if it prove only moderately successful. A little over two years ago a Mines Development Act was passed in Victoria, which provided £100,000 for grants to assist mining. Of that sum all the money set aside for gold mining—£75,000—has been allot ted. Under the terms of the Act the remaining £25,000 coul only be expended in developing mining for other minerals tha gold. Of that £25,000 only £1,100 has been allotted, but the balance cannot be utilized for assisting gold mines. The posi tion therefore may be easily summed up. All the money voted for developing gold mining has been exhausted, and, ac cording to a statement made by the Minister for Mines, ther is little likelihood of another Mines Development Bill—provid ing for further grants for mining—being introduced durin the coming season. Mr. McBride, Minister for Mines, however has decided to recommend to the Cabinet that £5,000 be give to assist co-operative mining parties. An examination of th records of transactions between the government and minin companies discloses that a remarkably small proportion of th money advanced has been repaid. Since the inception of th Mines Development Act in 1897, about £380,000 has been ad vanced, and of that sum the State has received back approxi mately only £35,000. Of course, it is not expected that all th money advanced for mining will be repaid. A great deal of i is necessarily expended in testing ground which proves un payable. Mr. McBride states that numerous applications b companies and parties for assistance continue to reach the de partment. His recent visit to some of the mining districts ha confirmed his belief that in the vast majority of cases the ad vances have been judiciously made, and he admits that if th money were available a great deal more could be expended wit advantage to the industry.

Sydney.—The gold yield of New South Wales for Jul was 26,772 ounces, valued at £85,341. For the first seven month of the year the yield has been 126,901 ounces, valued at £445 979.

INDIA.

The gold production of the mines of the Kolar Goldfiel (Mysore) and one outside mine (the Hutti Nizam's), for Jul was 47,006 ounces, an increase of 252 ounces compared with th return of the previous month.

CHINA.

The Pekin Syndicate announces that the output and sales o coal for last month were as follows: Output, 23,000 tons; sale 17,500 tons; boiler consumption, 2,500 tons.

SOUTH AFRICA.

Pretoria.—The report of the Mines Commission, which wa appointed in 1907, is issued. It shows that the death rat among underground workers is 60 per cent. higher than amon those working above ground, ignoring those dying elsewher The average term of employment underground is seven to nin years, and the average age at death 35, as compared with 5 on the Bendigo mines. The report advocates rigorous measure in regard to health, housing and ventilation. No objection i made to the natives being supplied with a moderate and regu lated quantity of beer.

GOLD COAST.

The report of the government of the Gold Coast on the gol mining industry of the colony for 1909 is a rather belate document, but from its official character has, of course, a cer tain interest. The amount of gold produced during 1909 show ed a decrease of 50,763 ounces, as compared with the amoun produced during the previous year. This decrease, the repor reminds us, was nearly totally due to the fact that mines whic were producing in 1908 ceased to produce during the year wit a view to increasing their ore reserves so as to enable large tonnages to be treated. On the quartz and conglomerate mine in Ashanti and the Gold Coast Colony 404,853 tons were treate and produced 210,391 ounces, being an extraction of 10.40 dwts. per ton of 2,000 pounds.

UNITED STATES.

Spokane, Wash., Aug. 16.—When Judge Dietrich, in the fed-al court at Moscow, Idaho, ruled that mining companies oper-ting in the Coeur d'Alene district have the right to dump ailings into streams, a decision of prime importance became a atter of record in northern Idaho. Unless reversed by the ourt of appeals, the decision removes one of the most vexing ituations which the mining companies have had to face. These ases have been pending six years. The suit upon which the ecision was rendered was instituted by Elmer Doty, a rancher n the Coeur d'Alene River. There were 65 cases, but all of hem involved the same principle, the damages claimed amount-ng to $1,223,000. Mr. Doty alleged that by dumping the tail-ngs in the river the mining companies caused the river to rise nd overflow the lands along the river.

Joplin.—The Joplin district, including contiguous parts of Missouri, Kansas, Arkansas and Oklahoma, produced 147,310 hort tons of zinc in 1894. From this figure the output increased o 286,538 in 1907, dropping with lower prices to 258,628 in 908. In the meantime, and particularly since 1904, produc-ion elsewhere in the United States grew rapidly, though it was mall as compared with Joplin. This outside production is specially small if the higher content of the Missouri ore be aken into account. It was early determined that a tariff on inc ore would be laid; and on August 1st, 1909, the new duties ook effect. They are arranged on a sliding scale, the tax vary-ng with the percentage of metal in the ore; up to and includ-ng 10 per cent. the ore is free; from 15 to 20 per cent. the tax s ¼ cent; from 20 to 25 per cent., ½ cent; over 25 per cent., . cent per pound of metal contained in the ore. Since no ore nder 25 per cent. can be imported economically, the practical ffect is to levy the maximum tax. This, on the ores actually mported, which assay about 36 per cent. zinc, amounts to $7.20 a ton. On this basis, making due allowance for freight rate nd difference in grade, Mexican ore is as cheap at the Kansas urnaces equipped to smelt it, as is the near-by Joplin ore. If he amount paid as duty be deducted from the price paid the Mexican miner, which is largely done, the foreign ore may be reated at higher profit than the domestic. That this is true s shown by the fact that foreign ore has continued to be im-ported, though in somewhat reduced amount. In the seven months of 1909, before the new law went into effect, importa-ions averaged 10,338 tons per month. In the first seven months following, they averaged 7,627. For January and February they were equivalent to a little more than 28 per cent. of the Joplin production.

New York.—Utah's report for the second quarter ended June 30th, of its calendar and fiscal year, shows what the com-pany can do on an average selling price for copper at 12½ cents a pound. It shows the net profits for the quarter of $1,-548,979, equal to 10.05 per cent. on the 1,540,000 shares out-standing. After dividends of $1,155,243, the surplus balance for the quarter of $393,735 is equivalent to 2.55 per cent. on the total par value of the company's stock. At this rate earn-ings for the year would show 40.2 per cent., or 10.2 per cent. in excess of dividend requirements.

Combining the reports for the first two quarters of the year, gives a half-year's showing as follows:

Net profits from mining and milling operations, $2,042,981; additional income, $21,525; income from Nevada Consolidated dividend, $712,856; total, $2,777,362. Dividends, $2,310,486; net surplus for six months, $466,876.

For some unexplained reason the Nevada Consolidated divi-dend was not included in the first quarter's report, but is taken into consideration in the above table.

The foregoing six months' surplus of $466,876 is at the rate of $933,752, or 6.6 per cent. for the year on the stock outstand-ing. Production for the second quarter totalled 25,124,052 pounds, or at the rate of 100,496,208 pounds for the year, which probably represents the maximum rate of production which the Utah will attain for some time, or at least until the price of copper improves. Following is the record production by months (in pounds):

January	4,745,066
February	5,913,465
March	7,853,288
April	7,902,643
May	8,862,913
June	8,358,496
Total	43,635,871

Production was retarded in the first quarter by bad weather, and the output from the Boston Consolidated plant, which was taken over about February 1st, did not begin to show fully until the second quarter arrived. In 1909 the Utah Copper Company produced 51,749,000 pounds of copper at an average cost of 7.787 cents a pound. During the first quarter of 1910 the net cost per pound was 8.43 cents and 7.53 cents in the second quarter, making an average for the half year of 7.88 cents. This is exceeded among the porphyry mines by only the 6.34-cent record by the Nevada Consolidated for the quarter ended June 30th last. During May, the Utah cost per pound was 7.17 cents and the cost at the Magna plant was 7.06 cents, not taking into consideration in either instance outside earn-ings.

MEXICO.

Commencing with the present fiscal year, which began July 1st, mining concerns in the producing stage in the State of Jalisco will be taxed 1 per cent. on the value of ore or mill products sold the smelters and ore and metal buyers. This tax is something new in Jalisco, although a number of other Mexican states collect a similar tax. It constitutes the third direct tax on values of mining products, computed on their market value. The two others are the federal impost at the smelter and the federal stamp tax on the "factura," or bill of sale to the buyer. The combined direct taxes based on each bill of sale are about 3 per cent. of the total.

The metals mentioned as taxable under the new Jalisco law, which was passed by the state legislature in May and put into effect by a decree of Governor Ahumada, are gold, silver, cop-per and lead. Monthly the state treasurer will advise local col-lectors the market prices of these metals for the following month, which will be calculated from the average prices in for-eign market during the first 20 days of each month.

COMPANY NOTES.

TEMISKAMING'S QUARTERLY STATEMENT.

Following is a statement issued by the Temiskaming directors for the second quarter of the current year. The great improve-ment in the company's finances since the annual meeting no doubt accounts for the strength of Temiskaming stock in the mining market.

During the first six months of our fiscal year we have pro-duced and shipped 851,725 ounces of silver as against 670,930 for the whole of last year. Of this amount 635,889 were pro-duced by hand picking, and 215,906 were recovered at the mill from 9,177 tons of ore during 92 working days.

The mill feed consisted in the main part of the discard from the hand sorting tables, and ore from the development faces. The remainder, or about one-third of the whole, was made from the dump reserves.

The milling reserves as blocked out in the mine, as shown in

our last annual report, remain untouched, while the dump reserve has been reduced by but 860 tons.

The main shaft has been carried to a depth of 520 feet. Crosscutting to No. 2 vein has now commenced from the 500-foot station, and there is still some 50 feet to drive before we encounter it.

The formation to this depth remains the same, so we look with confidence to equally good results here as obtained on the 400-foot level.

At the latter depth considerable development work has already been done in opening up veins Nos. 1, 2 and 4, with results that are most gratifying. No. 4 is most spectacular, varying up to 26 inches of bonanza ore. No. 2 varies from 6 to 10 inches wide from three to four hundred-ounce ore, and No. 1, which we have just encountered on this level, is some 6 inches wide and equally high grade.

The high-grade reserves have more than trebled during this period, and our condition is such that we can easily maintain our present heavy output for a considerable length of time.

We think the stockholders are to be congratulated on the fact that whereas on February 1st we were in debt to the extent of some $97,000; this has now been liquidated, and after paying all indebtedness, we show a balance of $179,496.45.

The statement summarized is as follows:—

Assets.

Capital assets	$2,628,579.60
Cash assets	266,684.84
Treasury stock	829.00
	$2,896,093.44

Liabilities.

Cash liabilities	$ 87,188.39
Capital stock	2,500,000.00
Balance brought down and profits for 6 months	308,905.05
	$2,896,093.44

A statement issued by the Temiskaming directors states that the mine during the first six months of its fiscal year has produced and shipped 851,725 ounces of silver, as against 65,670,930 ounces for the whole of last year.

The Intercolonial Coal Company has declared a dividend for the half year of 3 per cent. In the second half of the year the company pays 4 per cent., or a total of 7 per cent.

A meeting in London on August 18th of the shareholders of the Le Roi Mining Company unanimously agreed on liquidation. A. J. McMillan was appointed liquidator. The property will probably continue to be operated.

McKinley-Darragh-Savage Company has declared the regular quarterly dividend of 3 per cent., and an extra dividend of 2 per cent. payable October 1st. Books close from September 10th to October 1st, inclusive.

STATISTICS AND RETURNS

CROW'S NEST OUTPUT.

The output of the Crow's Nest Pass Coal Company's collieries for the last three months follows:

	May.	June.	July.	Total.
1910	92,900	116,450	104,000	313,350
1909	54,000	83,400	72,000	209,400
Increase	38,900	33,050	32,000	103,950

COBALT ORE SHIPMENTS.

The shipments in tons from Cobalt for the first seven months of the year 1910, by months, are as follows:

January	2,025.06
February	2,248.99
March	2,594.78
April	2,814.08
May	2,243.17
June	2,917.00
July	3,014.92
Total	17,858.00

Bullion Shipments.

	Ounces.	Value.

Emerald Hill	7	7
Other mines	...	16,037
Total	7,765	298,981

Owing to the disturbed condition of affairs at Phoenix, following the fire of Friday, this week's returns of the Boundary shipments were not issued. On the basis, however, of the figures for the last four weeks, the following estimates for the time being may be accepted:

Boundary shipments	30,825	1,074,146
B. C. Copper Co.'s receipts, Greenwood	8,068	218,084
Granby Co.'s receipts, Grand Forks	20,597	733,941

On the basis of the above calculation, the total shipments for the week should approximate 40,650 tons, and for the year to date, 1,427,700 tons. The total receipts for the week, on the same basis, should be 36,330 tons, and for the year to date, 1,251,000 tons.

TORONTO MARKETS.

Aug. 24th.—(Quotations from Canada Metal Co., Toronto.)
Spelter, 5½ cents per lb.

MEN OF WEALTH

Are almost invariably the greatest believers in Life Insurance because they recognize the value of a "Cash" estate absolutely secured, and therefore they aim to maintain a considerable portion of their estate in the form of Life Insurance.

The North American Life Assurance Company appeals to business men because of its long record of success and its able and progressive management.

Assets, over $10,500,000. Net Surplus, over $1,000,000.
Good Agency openings for energetic men.

The Nissen Stamp Mill

Will Save 50% of Your Power

Owing to the maximum crushing efficiency secured, the power required to operate Nissen Stamp Mills is about half that of other mills of the same capacity output.

READ THESE LETTERS

NORTHERN CUSTOMS CONCENTRATORS, LIMITED.
COBALT, ONT., December 31st, 1909.

The Canadian Fairbanks Co., Toronto, Ont.

Dear Sirs:—

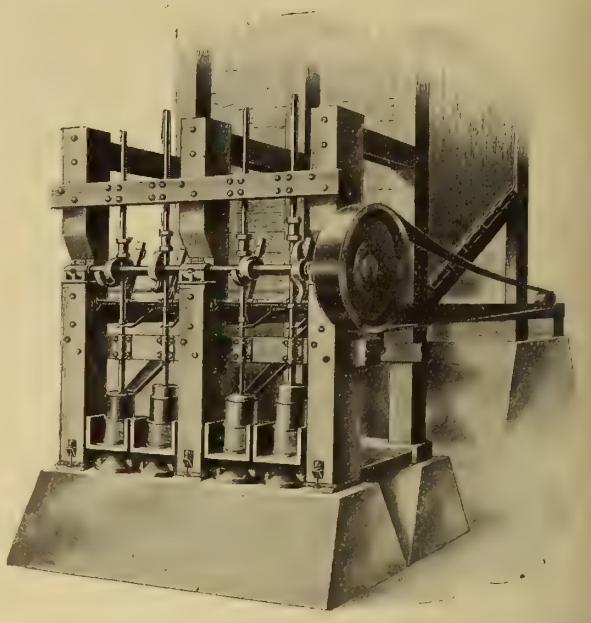
In answer to your inquiry regarding the Nissen Stamps supplied by your firm. These stamps are running steadily on some of the hardest rock on the Continent, they are crushing 5.3 tons of ore per head in twenty-four hours. The feed rolled down to go through about a one inch hole.

The screen used for the above tonnage was 30 x 30 mesh, 28 gauge wire, opening .018. With a coarser screen the tonnage would of coarse be larger.

The shoes and dies wear even, and the splash is well distributed over the screen. The arrangements for keeping up the weight of the stamps are very good.

I can recommend the stamps. Yours truly,

(Sgd.) F. J. Bourne, Superintendent.



COBALT, ONT., July 11th, 1910.

The Canadian Fairbanks Co., Toronto, Ont.

Gentlemen:— Re Nissen Stamps

The two stamps installed in our mill by you last winter have given excellent satisfaction, so much so that having to increase our tonnage output, we have decided to place an order with you for two additional stamps. Details of this will be sent and we would ask you to rush delivery.

Yours truly,
NORTHERN CUSTOMS CONCENTRATORS, LIMITED.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price,

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE FOLLOWING GEOLOGICAL MAPS HAVE BEEN RECENTLY ISSUED:—

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1025. Waverley Sheet. Scale 1 mile to 1 inch.
1037. Windsor Sheet. Scale 1 mile to 1 inch.

QUEBEC

1079. Geological and Topographical Map of St. Bruno Mountain, Chambly Co., Que. Scale 800 ft. to 1 inch.

ONTARIO

1076. Gowganda Mining Division. Scale 1 mile to 1 inch.
1061. Explored routes in a portion of North Western Ontario, traversed by the National Transcontinental railway between Lake Minnitaki and Lake of the Woods. Scale 4 miles to 1 inch.

ALBERTA

1032. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland. Scale 400 feet to 1 inch.
1004. Geological Sheet, Rossland Mining District. Scale 1200 feet to 1 inch.
1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1105. Map No. 4A. Geological—Golden Zone Mining Camp near Hedley, B.C., by C. Camsell. Scale 600 feet to 1 inch.
1106. Map No. 3A, Geological—Mining Claims on Henry Creek near Hedley, B.C., by C. Camsell. Scale 800 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1041. Geological Map Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of the ore bodies of the same belt.
1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.
973. Catalogue of Canadian Birds, by John Macoun and James M. Macoun.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotland Part I, Economics, Part II Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

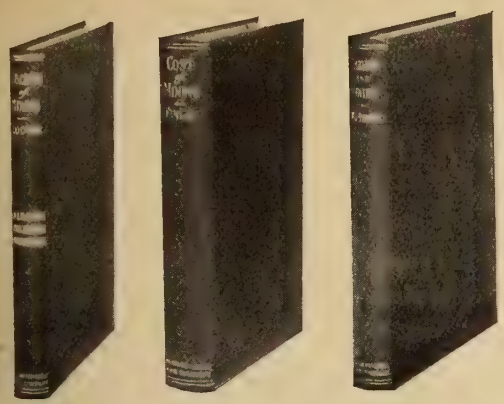
ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon and Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
980. Report on a portion of Algoma and Thunder Bay Districts, by W. J. Wilson, and on the region lying north of Lake Superior between the Pie and the Nipigon Rivers, by W. H. Collins. A map showing the geology along the water courses from Lake Superior to the Albany River and from Missinabi to Nipigon River accompanies the report.
1075. Report on the Gowganda Mining Division 1908, accompanied by a map, by W. H. Collins.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.

YUKON and NORTH WEST TERRITORIES



1050. Whitehorse Copper Belt, accompanied by maps, by R. G. McConnell.
1097. A Reconnaissance across the McKenzie Mountains on the Pelly, Ross and Gravel Rivers, Yukon and North West Territories, with map, by Joseph Keele.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Book Dept. CANADIAN MINING JOURNAL, *Confederation Life Building* TORONTO

Geology Applied to Mining

By Josiah Edward Spurr, A.M.

Mining men, prospectors, investors and students have found this book a treasure house. It is a plain, simple, straightforward application of economic geology to mining problems. It is a concise summary of the principles of ore deposits for the man who wishes to exploit them. It isn't *geology*, but *geology* as *applied to practical mining*. It boils down the abstract science for the practical mining man and student—the processes of deposits, the arrangement of stratified rocks, igneous rocks, structures, placers, chemical geology, etc., etc.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silve $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Mineral or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,0 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land h been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in t Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

Westinghouse Motor-Generators

Westinghouse Standard Motor-Generators are built for both 25 cycle and 60 cycle circuits, in sizes up to and including 2,000 kilowatts, utilizing either synchronous or induction motors. Synchronous motor-generators are arranged for self-starting from the alternating-current end, and all sets may be started from the direct-current end.

In general, Westinghouse Motor-Generators may be used without step-down transformers on alternating-current voltages up to 6,600 volts. Direct-current voltages are 250 and 600 volts.

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

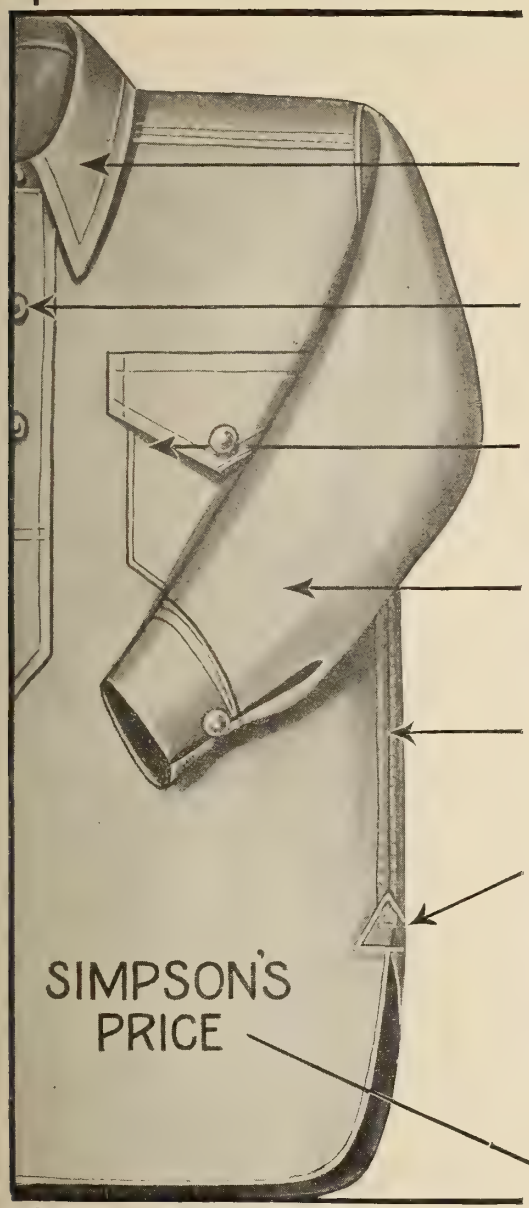
"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines



Nobel Monobel, Saxonite and Carbonite.

KHAKI DUCK SHIRT

For Miners, Lumbermen, Prospectors, Surveyors

MADE THE SIMPSON WAY

NOTE THE DIFFERENCE FROM THE ORDINARY WAY:—

COLLAR will fit neatly, all ways, all the time. Is well interlined to retain its shape. Steels inserted to prevent curling points.

DOME FASTENERS of brass used throughout. No buttons to come off. No occasion to swear. A feature that will be appreciated by every man.

POCKET Two pockets, one on each side, with dome fastened flap. A splendid idea. Plenty of *pocket space* is a Simpson improvement.

SLEEVES are made large. Plenty of elbow room. Inter-lined wrist-band, dome-fastened. One of the strong points not to be overlooked, viz.—roomy sleeves.

DOUBLE STITCHED seams throughout, with extra strong thread insuring strong wear. This Simpson shirt is made stronger to wear where the most wear comes.

GUSSETS are made strong and double stitched, adding extra strength. You can be absolutely sure the seams will not rip at this point.

FABRIC extra heavy khaki duck. Wind-proof and shower-proof. Will stand the hardest kind of wear. Try it. Almost indestructible.

KG522 IS THE ORDER NUMBER
Sizes 14½ to 18

$1.00

THE POSTAGE IS 20c EACH

"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just becanse it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be the stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we **know**, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs **per year** than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line. As you have everything to gain and nothing to lose, why not investigate NOW?

BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

Another Victory for the "DEISTER"

We are placing 180 Improved No. 3 Deister Slime Tables and 132 No. 2 Deister Sand Tables in the Miami Copper Company's mill, Miami, Arizona. This large order was the direct result of the showing made by the Deister Tables. The No. 2 Deister competing against all of the well-known makes of tables on the market—The Improved No. 3 Deister competing against vanners.

By eliminating teeth in the roller and rocker arm, our driving mechanism is now the most effective, noiseless and durable on the market.

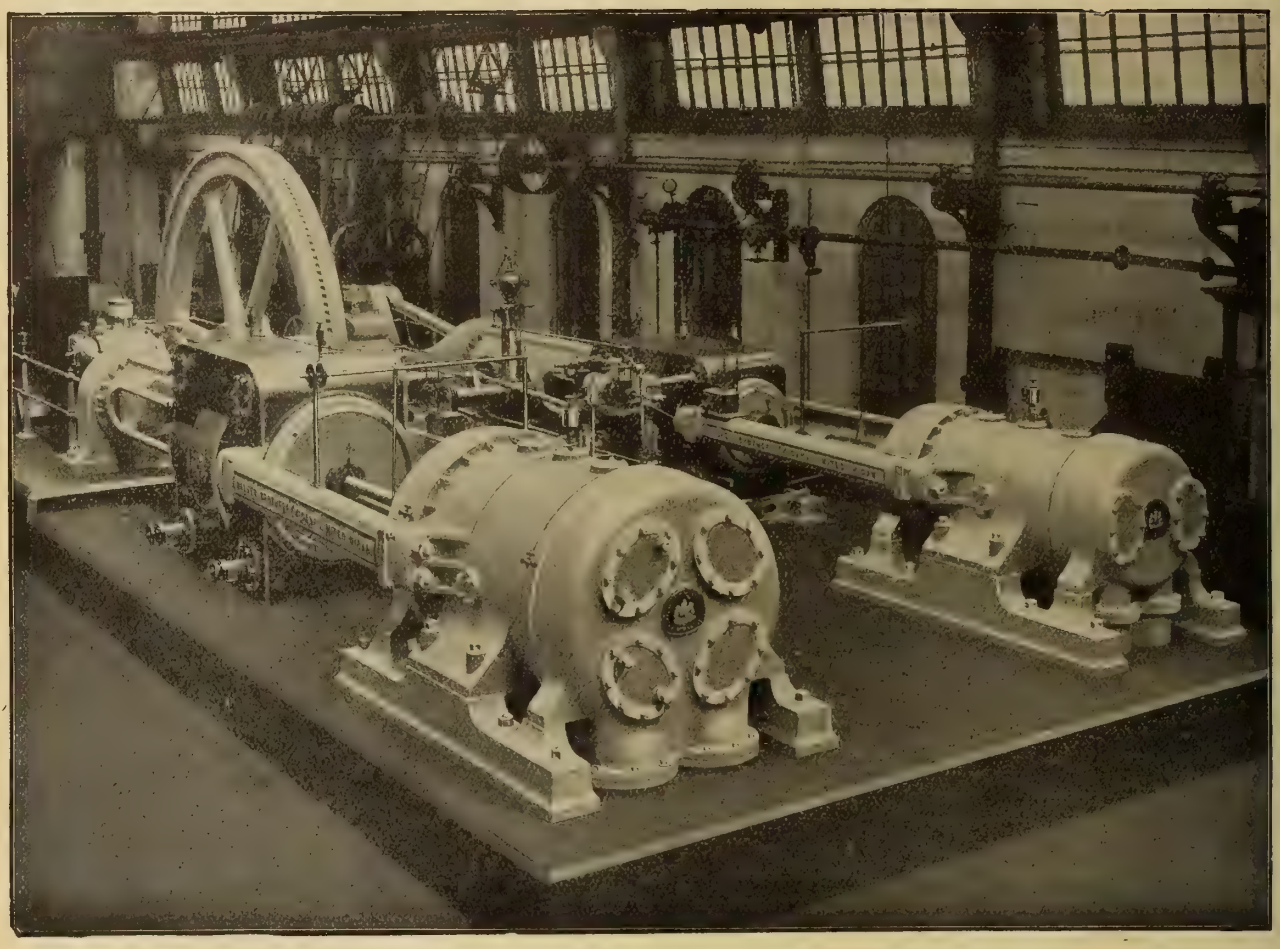
An Engine that is built for Mine Haulage Work.

THE McEWEN

The simplicity, accessibility, close regulation and general reliability of these engines make them ideal for Mine work.

They are smooth running, require little attention and are quick and sensitive in regulation under full load or when running light.

A heavy rigid bed. Cross head guides, main bearings, and face for cylinder attachment machined at one operation. All parts are in perfect line and will stay so. Piston type valve, double ported, frictionless. Balancing pressure plate slotted to correspond with valve seat. A quicker more powerful stroke by providing double admission and exhaust edges. Automatic Begthrup Inertia Governor.



Built in simple or compound units of from 10 to 700 H. P.

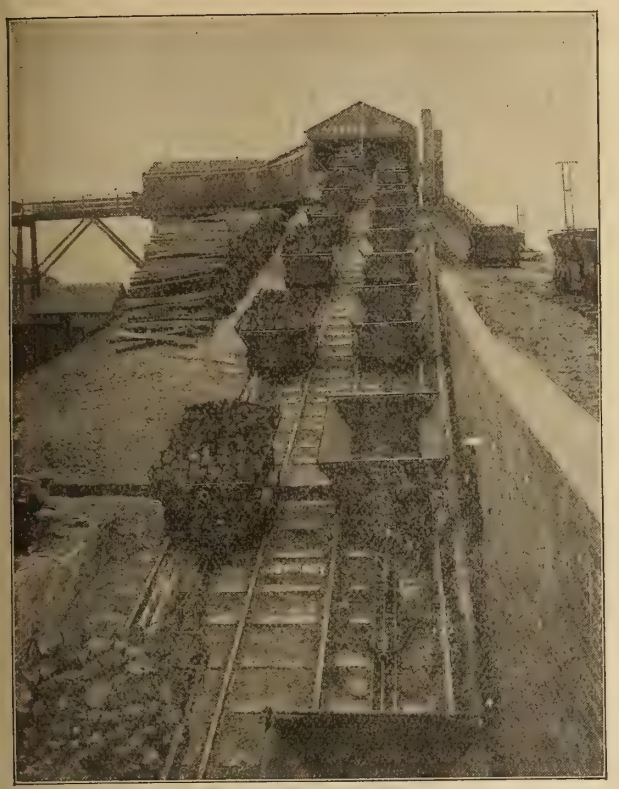
CYANIDE HANDBOOK BY J. E. Clennell



Over 500 pages, 6x9, illustrated, $5.00 (21s) net, postpaid

Mr. Clennell has been in close touch with the rapid developments of cyaniding. He has been instrumental, too, in many important discoveries, and his work in this field has taken him to the leading plants of the world. It deals generally with Cyanide and does not confine itself to the process alone. It is divided into nine main parts covering the subject more fully and exactly than it has heretofore been handled.

Especially noteworthy is the full treatment of recent developments and important phases heretofore *inadequately treated.*

EAST AND WEST.

Mr. Kipling, the chanticler of Empire, once wrote to the effect that East is East, and West is West. He added some remarks upon the entire improbability of a meeting between the two. Indeed he went so far as to asseverate that that meeting would not take place until Judgment Day.

Several historic assertions are on record as to the precise date of Judgment Day. None of these assertions has been proved correct. Thus we have no means of judging the accuracy of Mr. Kipling's statement. Yet we are confronted with the fact that a meeting must soon take place between Canada West and Canada East. And this is why.

Nova Scotian coal operators are traditionally opposed to anything resembling reciprocity in coal as between Canada and the United States. Their reasons are obvious, numerous, and well set forth. Albertan and British Columbian coal operators are strongly in favour of reciprocity for reasons equally cogent. Heretofore Nova Scotia has had the stronger voice at Ottawa. But now the West is vocal.

Our honoured Premier, Sir Wilfrid Laurier, has but now completed an official tour of Western Canada. On not one, but on many occasions, good citizens made opportunities to pour into his ear their complaints on matters pertaining to tariff and trade. At Lethbridge, particularly, he listened to the sorrows of local coal-mine operators. The substance of their plaint was that they have reached the present limit of the domestic market and that the tariff barrier precludes them from exploiting the United States market adequately. One manager stated with great frankness that they needed the market, needed it badly, and were shut out of it because Nova Scotia desired protection from Pennsylvania and Virginia. Free trade, he claimed, would develop enormously the Western field and would reduce the price to consumers. And he added a suggestion that, if necessary, a tariff zone be established in Nova Scotia, the West being left free from restrictions.

Whilst without question it is useful to hear both sides of every debate, we fear that Sir Wilfrid will not find that the problem is as simple as it seems. In fact, it is far from being simple. Each side has a right to be heard. Neither side can be dealt with at the expense of the other. The chief difficulty lies in so adjusting matters as to do fairly by both.

A struggle at Ottawa between Eastern and Western interests would be neither expedient nor profitable. We suggest that accredited representatives of both meet on neutral ground and discuss matters fully. This has long been needed. The issues to be considered are

clear. The steps to be taken can, we believe, be made not unfair to either East or West.

Meanwhile there would be no harm in a public investigation of railway freight rates.

NOVA SCOTIAN TUNGSTEN MINING.

In this number of the CANADIAN MINING JOURNAL will be found a brief description of the tungsten deposits that are now being opened at Scheelite, Halifax County, Nova Scotia. The article referred to is meant to be as general as possible. At this stage it is unwise to be too specific.

A visit to Scheelite is instructive. Here is the first recent instance of an enterprise entirely Nova Scotian in discovery, exploitation, and organization. The discovery was made by two local prospectors, Messrs. Reynolds and Currie, aided by Mr. A. L. McCallum. The financial organization was undertaken by Mr. H. C. Borden, a brother of Mr. R. L. Borden, leader of the Federal Opposition. If present indications may be taken at their face value, the enterprise will be successfully conducted by the present operators. It is most gratifying, in any case, to witness the rare sight of Nova Scotians giving tangible evidence of their confidence in themselves and in their country. It is also gratifying to learn that the intimate knowledge of the mineral deposits of Nova Scotia possessed by local prospectors has been recognized. The Nova Scotian prospector may not be able to write technical papers, but he has a remarkable nose for ore.

That Mr. Faribault's diagnosis of the field is correct constitutes another feather in his already well decorated cap. Mr. Faribault's advice gave direction to the work from the first. Without the counsel of this distinguished official of the Geological Survey the mining problems might not yet have been solved.

We note with pleasure that the mine is not being over-equipped. Thus costly errors are to be avoided. The positive advantages of cheap mining, cheap and efficient labour, easy access, and ample territory wherein to work and prospect, are all evident. All in all, the mining camp of Scheelite has had an auspicious beginning and promises good things. When it is remembered that the concentrates will be the equivalent of high grade Cobalt silver ore, and that the ore itself is ideally susceptible of treatment, a standard of comparison is gained.

We shall watch with keen interest the development of Scheelite. If it lives up to our expectations, Nova Scotia will possess an industry that will attract much more than local attention.

PUBLICITY.

We are often filled with shame because of the paucity of general mining news in the Canadian press. It is quite true that columns will often be devoted to spectacular finds or to special promotions. But regular mining news service there is none.

Coal, iron, and steel outputs are reported sporadically from the east. Shipments from Cobalt and Gowganda are published weekly. Southwestern British Columbia ore shipments are likewise reported, and the statements of ore received at the smelters of these districts are made public. Apart from a few coal mines, the above mentioned branches of the industry are about all from which the public hear with any degree of regularity.

For instance, from the asbestos concerns of Quebec only annual statements are issued, and these are by no means complete. From the large copper-nickel enterprises of Ontario no regular statements or reports are forthcoming. And so on through the list. Numberless small concerns are hidden in perpetual obscurity.

This is decidedly not as it should be, and it behooves the powers that be to bring about a change. Statistics, provided they are timely, complete, and accurate, have a distinct commercial value. If belated, incomplete, and inaccurate, they are worse than useless. The one means of securing accuracy and completeness is to insist upon weekly returns from each and every considerable producer of coal, of ore, and of metallurgical products. Any attempt to collect figures merely from year to year is wrong in principle and uncertain in results.

The remedy for this condition in Canada lies in the hands of each province. The Mining Department of each is capable of bringing pressure to bear upon companies operating under its jurisdiction. Pressure, however, may not and should not be necessary. At worst, a system of weekly open returns may not be welcome by mine operators, but we are confident that their objections will not be long-lived.

When one examines the analytical returns made public by the Rand, one has no difficulty in perceiving their value. The public, kept fully informed as to the capacity of each plant, the value of ore mined and of reserves, has its interest constantly inspired. The direct effects of this publicity are to guide investors, to improve mining practice, and to localize and minimize waste. The operator whose reports and returns are read by thousands is not prone to careless work. He is stimulated to his highest and best.

We have spoken before of the splendid isolation of the mining industry. That isolation costs money. That isolation, also, would disappear if the public were taken into the confidence of the operator. If in nothing else, surely in the item of outputs bona fide mining companies gain nothing and lose much by the unjustifiable policy of silence.

THE EXPLOSIBILITY OF COAL DUST.

It is not our intention here to discuss the question of the explosibility of coal dust. What we wish to point out is that some of the factors in the case have not yet been determined, and that, therefore, final pronouncements are not in order.

At the Pittsburg Testing Station, erected by the Technologic Branch of the United States Geological Survey,

and now under the control of the newly created Bureau of Mines, experiments have been carried on for the purpose of investigating the nature of coal dust, with especial reference to its explosibility. The chief mining engineer of the Bureau, Mr. George S. Rice, has recently written a bulletin describing these experiments. Certain conclusions are outlined by Mr. Rice. Whilst the reader is informed that these conclusions are tentative, yet as they are expressed in definitive language they are fairly to be criticized. And on two points, at least, we fear that Mr. Rice has erred.

The conclusion that in ordinary conditions the dust must have originated from coal carrying at least 10 per cent. of volatile combustible matter has not sufficient basis in fact or, rather, in experiment. British experiments have proved that explosions can be obtained with charcoal dust. Mr. Rice mentions this latter fact, but apparently does not accept it.

Again, the preliminary statement that the force of the explosion of firedamp is terrific, is quite wrong. Firedamp explosions develop no terrific force.

It is not wise to overlook the fact that the British experiments have covered a much longer period of time than have those conducted in the United States. Long and unsparing study is a pre-requisite. This has not been absent in Great Britain. But we must express a candid doubt as to the fitness of the United States Bureau of Mines to rush into print concerning a subject so involved and so highly technical. It were better far to defer official reference to controversial phases until such time as the Bureau may have become more firmly established.

It is generally admitted that much is to be learned concerning coal dust. When the United States Bureau of Mines has a serious contribution to make we shall welcome it.

TECHNICAL LITERATURE ONCE AGAIN.

Laterly we gave utterance to the hope that the tilt between Mr. T. A. Rickard and his critics would be lively. It is. In Bulletin No. 71 of the Institution of Mining and Metallurgy, two new contributions appear. Both contributors, after a brief bow, proceed to carve Mr. Rickard and to place salt on the wounds. In an entertaining ten pages Mr. Rickard replies to each and all who have entered the lists against him.

In our opinion, Mr. Rickard has escaped with surprisingly few marks. He seems fairly to have established his position in objecting to the use of such localisms as "mullock." His objection to the misuse of the word "partially" is also sustained. But in the matter of preposition-verbs, the critics have worsted him. All this by the way. The outstanding fact is that Mr. Rickard has single-handed resisted the onslaught of many tall and fiery knights. His pen arm yet is free. A bloody wound or two can be detected. But he has emerged, if not victorious, yet by no means defeated. And his agility has been beautiful. We had truly believed him at least temporarily disabled.

The discussion that has now been closed has indisputably aroused more and keener interest than any of recent years. To our resolute brother the profession owes a hearty vote of thanks.

THE QUICK AND THE DEAD.

A change is coming over general mining activities in Canada. It is not uncommon to hear of independent Canadian investors taking up abandoned mines. This is probably more the case in Ontario than elsewhere, but evidence of revival is not lacking in Nova Scotia, New Brunswick, Quebec, or British Columbia.

In Nova Scotia, for instance, old gold mines are being re-opened; gypsum and infusorial earth deposits are being again taken up; and generally there is a great deal of quiet work being done. In New Brunswick, copper is being investigated, despite the record of the past. Copper and alluvial gold are subjects of revived interest in Quebec. Ontario's western gold mines show signs of life. Of British Columbia's lead and zinc the same thing is true.

These facts, considered in conjunction with the many new activities in coal, iron, gold, oil, feldspar and so on, surely mean that the mining industry of Canada is on the eve of expansion to limits not heretofore hoped for. Statistics may not show the measure of this expansion. But, before long, even statistical statements will be affected.

PORCUPINE AND COBALT.

He who denies that experience teaches need only glance over the histories of Cobalt and of Porcupine. Porcupine has learned wisdom from Cobalt. The pioneers of Porcupine were in the main strong, clean men who frowned upon crookedness. So far as is humanly possible Porcupine has been developed on its own merits. Cobalt was sadly afflicted for years with bad men and bad methods. The process of weeding out was long. Porcupine has commenced weeding early. That it may be continued is our earnest prayer!

EDITORIAL NOTES.

Diamond drilling has brought satisfactory results in Porcupine ore bodies.

Rhodesia has established a Geological Survey. As the gold output of the colony is now about $13,000,000 per annum, this step is not rash.

The rise in the price of tin has been phenomenal. Lately in London the spot price has reached £164 10s., whereas a week before it stood at £159.

An exceedingly rich ore shoot was recently struck at a gold mine at Renfrew, Nova Scotia. Specimens of the ore, filling a small pan, contained more than 50 ounces.

The Nugget gold mine has attracted much attention to the Sheep Creek district, B.C. It has been producing steadily for a considerable time. It was exploited by Mr. A. H. Gracey, a former student at Kingston School of Mines.

In the United Kingdom the proporition of workpeople affected by changes in wages during 1909, was largest in the coal mining industry. The gain in wages in the industry was larger absolutely and proportionately than in any other industry.

A new detonator is being manufactured by a French firm. It consists of a metallic tube which is filled with tri-nitro-toluol and drawn out thin. This detonates frozen nitro compounds, and, it is claimed, reduces by 30 per cent. the amount of explosive used.

The gas wells of the Maritime Oilfields, Limited, near Moncton, New Brunswick, are yielding handsomely. One well has a flow of 5,000,000 cubic feet per day. Oil, also, has been struck in commercial quantities. A scheme is being formulated whereby Moncton and other towns will be supplied with light, heat, and power from the gas.

The Porcupine Mine Owners' Association is a recent organization formed to give clean publicity to the Porcupine camp. From the New York office news bulletins will be distributed. The object is to discredit irresponsible rumours and to circulate authentic information. Mr. C. A. Foster is president and Mr. H. P. Davis secretary.

BOOK REVIEWS.

FROM PROSPECT TO MINE—BY ETIENNE A. RITTER, MINING ENGINEER,—166 PAGES—ILLUSTRATED WITH HALF-TONES AND DIAGRAMS—THE MINING SCIENCE PUBLISHING COMPANY, DENVER, COLORADO, 1910.

A consecutive discussion of the life history of a mine and of the successive steps by which a prospect becomes a dividend-paying mine, are here set forth. Dr. Ritter has attempted with a large measure of success to clothe his thoughts in language simple, direct, and instructive. He writes especially for the investor; but his book also serves as a review for the engineer.

To the layman the perusal of Dr. Ritter's modest little book should prove alike refreshing and informing.

ORE MINING METHODS — COMPRISING DESCRIPTIONS OF METHODS OF STOPING AND MINING IN NARROW AND WIDE VEINS AND BEDDED AND MASSIVE DEPOSITS, INCLUDING STULL AND SQUARE-SET MINING, FILLING AND CAVING METHODS, OPEN-CUT WORK, AND A DISCUSSION OF COSTS OF STOPING — BY WALTER R. CRANE, PH.D. — 219 PAGES. RENOUF PUBLISHING COMPANY, 25 McGILL COLLEGE AVENUE, MONTREAL, AND JOHN WILEY AND SONS, NEW YORK, 1910.

Mining methods vary with every locality. Even the same methods will change in different hands and in different circumstances. But it is generally true that some methods are unsound in principle and that others have proved sound and adaptable. To these latter Dr. Crane devotes his attention.

The sequence of treatment is as follows: Support of Workings, Methods of Stoping and Handling Ore in Stopes, Mining in Narrow Veins and Bedded Deposits, Methods of Mining in Wide Veins and Masses, Open-cut Mining, Cost of Mining.

In several respects Dr. Crane has not made his work inclusive enough, at least, to justify the title. For instance, shaft-sinking is not dealt with, nor is the relation of the shaft to other workings touched upon adequately. But these phases have been well developed in other text-books. In the main, "Ore Mining Methods" stops a gap successfully. It will serve as a useful source of reference to Canadian operators. Mine managers are all too prone either to follow local methods blindly, or to go off at a tangent. And the mine manager can afford to do neither.

In all probability the chapters on stoping will be found most suggestive. They cover a wide range, and they are well done. The last chapter, "Cost of Stoping," will give mine managers an excellent datum point.

Typographically the book is all that can be desired.

THE CANADIAN ANNUAL REVIEW OF PUBLIC AFFAIRS—1909—BY J. CASTELL HOPKINS, F.S.S. ILLUSTRATED — PRICE, $3.50 NET — THE ANNUAL REVIEW PUBLISHING COMPANY, LIMITED, TORONTO.

"The Canadian Annual Review of Public Affairs for 1909," by Mr. J. Castell Hopkins, is a volume of 660 pages packed with information regarding Canada—statistical, historical, descriptive. In this ninth year of its issue the work deals in literary and readable style with every phase of Canadian development and activity. Imperial and foreign relationships, material progress and prosperity, individual enterprise and business efforts, during the period under review.

Amongst the subjects to which sub-sections of the volume are devoted might be mentioned:

Germany, the British Navy and Canada's Position.
The Meeting of the Imperial Defence Conference.
Position and Policy of the Dominion Government.
Parliamentary Events and Discussions of the Year.
Tariff Affairs and the Canadian Manufacturers Association.
Militia Conditions, Appointments and Progress.
Dominion Labour Legislation and Conditions.
The Imperial Press Conference — Speeches and Results.

SCHEELITE.

A New Tungsten Mining Camp in Nova Scotia.

(Written for the CANADIAN MINING JOURNAL.)

The occurrence of scheelite in small quantities in Nova Scotia has been known for some time. The first discovery of scheelite-bearing quartz veins was made two years ago (See CANADIAN MINING JOURNAL, September 15th, 1908) in the gold mining district of Moose River, Halifax County. Not until last winter were arrangements completed to commence developing the property. It is now being handled by Mr. A. A. Hayward, formerly secretary of the Nova Scotia Mining Society. The syndicate that is behind Mr. Hayward is composed of Mr. R. L. Borden, Mr. M. J. O'Brien, and other prominent citizens. It was organized by Mr. H. C. Borden.

Scheelite, as the new settlement has been christened, is situated 28 miles northeast of Halifax City, and lies 12 miles from the Atlantic coast. The most direct route is from Elmsdale, on the Intercolonial, through Middle Musquodoboit, to Moose River. Except for the last two miles connecting Moose River and Scheelite, the roads are excellent. The projected railway between Dartmouth and Antigonish will pass within a few miles of the mines.

The geology of the district has been well described by Mr. E. R. Faribault in his paper appearing in the Summary Report of the Geological Survey for 1909. The rocks are the typical, altered, grey quartzose-sandstone, interstratified with beds of dark grey slate. These are the lowest strata of the gold-bearing series. They occur along the apex of the highest and most prominent anticlinal fold which passes through the Moose River gold district.

Rock exposures are scarce. Hence prospecting is not easy. Indeed, it appears to require special aptitude and

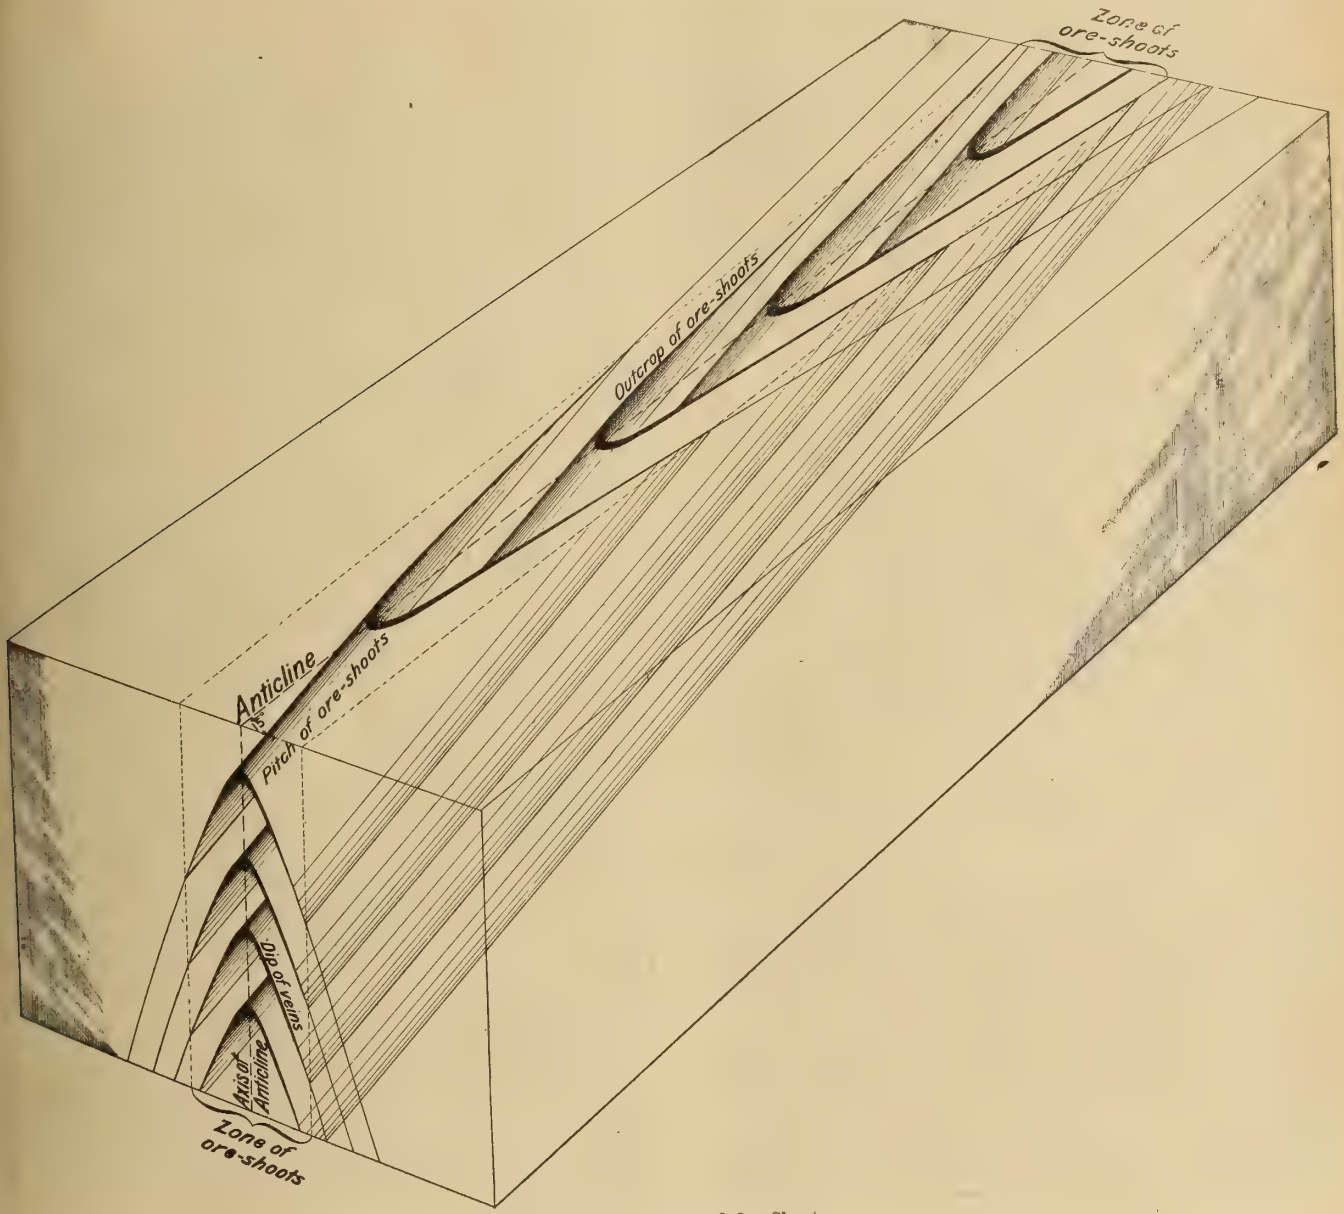

Diagram of Veins and Ore Shoots.

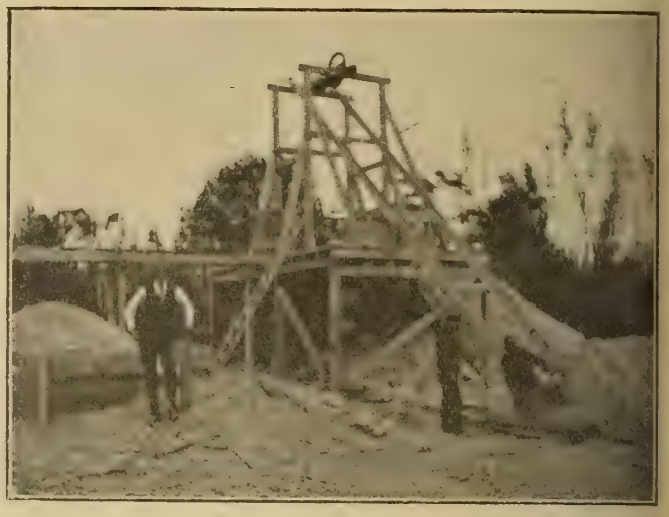
experience, and to the intelligent persistence of Messrs. Reynolds and Currie is due the credit of most of the discoveries so far made.

VEINS.—The accompanying diagram gives a clear idea of the geological structure. The scheelite-bearing veins, interbedded between "whin" (altered quartzite) and thin layers of slate. The profound folding to which the strata have been subjected has developed the usual system of synclines and anticlines. The veins themselves have their horizontal extension east and west.

View of Scheelite.



They dip either to the north or south, according as to whether the north or the south leg of the anticlinal fold is encountered. The horizontal axis of the fold pitches towards the west. Hence, successive outcrops are found of veins that overlie each other, the overlying vein being to the west of the underlying vein. Thus a vertical section from north to south would expose a series of veins, crumpled into arches and corresponding troughs,

View of Dwelling Tents.

and the whole body pitching gently to the west, and, in the section, converging gradually until successive complete anticlinal folds are visible in the centre of the series.

The veins range in width from one inch to two feet. Those richest in scheelite do not exceed 6 inches, and, in general, the average width lies between 4 and 6 inches. The richest veins are usually uniform in thickness. Distortion at the crest of an anticline or at the trough of a syncline may induce rolls or pockets that are abnormally thick. The vein matter is principally quartz, scheelite, and mispickel. The proportions in which these minerals are found vary within wide limits. In most of the veins scheelite is the more abundant, although occasionally mispickel predominates, and in one vein constitutes the whole. Occasional thin plates of calcite are found. But the three minerals mentioned above are by far the most important constituents. Other

Head-frame at Incline Shaft.

minerals commonly associated with Nova Scotian gold-bearing veins are entirely, or almost entirely, absent. As pointed out by Mr. Faribault, the presence of tourmaline and of mica, considered in connection with the intense metamorphism of the surrounding country rock, indicates that the tungsten deposits are of profound origin.

Messrs. A. A. Hayward, H. C. Borden, and R. L. Borden

Whilst the extent of the scheelite deposition is not yet known, it has been proved to be larger, more regular, and richer than was at first supposed.

Manager Hayward is now sinking an incline shaft on the outcrop of a syncline. The tram rails are exactly over the trough, and in each wall is visible one leg of the syncline. That is, on the north wall, the south leg of the anticline begins, and the crown of that anticline

as been discovered but a few feet north. Similarly on he south wall of the shaft the north leg of the syncline ext to the south is exposed. On both walls the vein natter has been allowed to remain. Examination proves these veins to be exceedingly rich. Much of he vein carries more than 50 per cent. of scheelite. All hat has been exposed will mine well over 20 per cent. The shaft is to be continued to the pitch of the synlinal trough and will make easy dry mining. The hope s entertained that the ore shoot will prove continuously to follow the pitch of the measures. Up to date here has eventuated nothing to disturb this hope.

There are, excluding the incline shaft, five prospect shafts sunk on different veins. In addition, there are eight other veins cut in trenching. Some of these are rich, some lean, but all carry scheelite.

Having glanced cursorily over the camp as a prospect, let us turn for a moment to another aspect. The work of establishing the new camp was begun on April 1st. At Moose River, two miles distant, 140,000 feet of

John Reynolds.

spruce and pine timber were sawn. 80,000 shingles were also made. The frame timbers of a 5-stamp mill were cut and are now in readiness. Next the town-site was prepared. Originally about 100 acres had been cleared of timber. This ground was now thoroughly stripped of bush, a necessary step to prevent damage from forest fires. Substantial storehouses, residence, cookhouse, and stables were built. The other necessary residences are tents erected on strong wooden platforms. Over these platforms will be built wooden houses ere the snow flies. Incidentally, though perhaps the subject deserves more than incidental mention, every building and every dwelling is kept in a condition of thorough cleanliness. The cook-house is spotless. The sleeping tents are fitted with immaculate double-deck iron beds. Nowhere is uncleanliness of any kind permitted. The sanitary arrangements are most effective. It is quite apparent that the men are encouraged to live up to a strict hygienic standard.

Steam is still being used for sinking. No costly machinery is on the ground, and none has been ordered. It is expected that a 5-stamp mill, equipped with suitable concentrating machinery, will be all that is necessary to produce dividends. It is possible that rolls and jigs may be employed instead of stamps. A mill of capacity equivalent to 5 stamps would yield at least one ton of 75 per cent. concentrates. On a great deal of the ore so far exposed the yield will be much higher. Without removing the arsenic from the concentrates they can be sold for more than $7.50 per unit. However, the arsenic, about 3 per cent. of which is contained in the concentrates, can be cheaply and expeditiously removed by roasting.

It is probable that mining can be carried on in Nova Scotia at lower figures than can be paralleled elsewhere. For instance, the incline shaft, 6 feet by 7 feet, is constructed at a cost of $9.50 per foot. This figure is inclusive of all surface expenses except fuel. A vertical shaft, 6 by 14 feet, was constructed at $14 per foot, inclusive. Drifting, it is estimated, will cost $5 per foot. In section the drift will approximate 7 feet in height and 4 feet in width. Mining costs will aggregate about $4 per ton for breaking the ore. This includes all underground charges. Can any readers of the CANADIAN MINING JOURNAL show lower costs than these?

To refresh the memories of those who have forgotten what scheelite is, it may be well to include a paragraph or two. Scheelite is calcium tungstate, a chemical combination of lime and tungsten trioxide ($CaO.WO_3$) containing when pure 80.6 per cent. of tungsten trioxide and 19.4 per cent. of lime. In some deposits copper, a very deleterious element, replaces to various extents the tungsten. In Nova Scotia, however, the only harmful element present is arsenic in the form of mispickel.

As scheelite has a specific gravity of 5.88 to 6.14, and as mispickel closely approximates this, 5.89 to 6.30, a close separation in the mill is not practicable. But it is quite practicable to roast off the arsenic.

. . . . .

It is altogether too soon to predict the future of Scheelite. The venture, however, is developing most favourably. If no interruptions are experienced, and it that bugbear of Nova Scotian mining, litigation, be avoided, the enterprise has all the earmarks of success.

MINING PROSPECTS ON UPPER FRASER RIVER, B.C.

A party of prospectors, representing a Kamloops, B.C., syndicate, after having spent the summer examining the country along the route of the Grand Trunk Pacific Railway between Fort George and the head waters of the Fraser River, lately returned to Kamloops. The "Standard," published in that town, says: "During the trip every care was taken to examine the country thoroughly both for agricultural purposes and for mineral. The country to Tete Jaune Cache contains much excellent agricultural land easily cleared, which will be along the line of railway when completed. It is, however, likely to become a mineral producing area, according to reports made by Mr. J. C. Bradley, who was in charge of operations for the syndicate, and outside of mica deposits will never produce any surprises. The mica deposits are immense, though, and the Tete Jaune Cache country may in a few years be able to control the markets of the world so far as this mineral is concerned. At Tete Jaune Cache the party met Mr. Stanley Washburn, of Minneapolis, who, with Mr. C. A. Thurston, a New York mining engineer, was examining the mica deposits at that place." (See also Geological Survey of Canada "Summary Report" for 1909, page 129.)

MINING AND METALLURGICAL OPPORTUNITIES IN CANADA.

A. B. WILLMOTT, Mining Engineer, Toronto, Ont.

Prefatory Note.—In the following brief articles attention is called to some industries connected with mining, which apparently might be profitably established in Canada at once. Where data are available the market is given, and the source of the raw material indicated. I do not pretend that I have critically examined into all the conditions that make for success, but only that the subjects mentioned are worthy of careful study by investors looking for meritorious propositions.

II.

An Alberta Iron Industry.

The provinces of Alberta and Saskatchewan, about 500,000 square miles in area, are rapidly settling up. Already the population is in the neighbourhood of 700,000 and within a few years it will have reached the vicinity of two million, which was the population of Ontario not many years ago. This population will undoubtedly require a certain amount of pig iron for local foundries. This will probably be mainly employed in repair work, though there will also be a demand in connection with local manufactures.

At present pig iron sells in the vicinity of $25.00 a ton at Winnipeg and at about the same figure at Vancouver. As one goes west from Winnipeg and east from Vancouver the price rises as distance increases. The price at such points as Calgary and Edmonton is at present practically prohibitory for any manufacturing purposes. At the same time local foundries would no doubt spring up at many centres in Saskatchewan, Alberta and Southeastern British Columbia, if the price of pig iron were reasonable. Prince Albert, Saskatoon, Regina, Moose Jaw, Edmonton, Calgary, Lethbridge, Fernie and Nelson should all be consuming points for a small amount of iron and at prices much above those secured in the east. The market would not be a large one, but would probably consume the product of a 50 or 100-ton furnace.

As to the raw materials for such a furnace, coke is, of course, abundant in the Crow's Nest Pass region and can probably be furnished north if required. This coke is of excellent quality and finds a large sale at the copper smelters.

A supply of iron ore is more uncertain and comparatively little is yet known of the ore possibilities. Near Kitchener eastern interests have drilled a deposit of hematite with results which were reported as very encouraging. On Bull River, north of Jaffrey, on the Crow's Nest division of the Canadian Pacific Railway, hematite deposits are also reported. At present there is no incentive to prospecting for iron ore as there has been no demand for properties and no sale for ore. Undoubtedly if a furnace were erected a number of deposits would be found. Moreover, the size of the furnace would not require any large amount of iron ore.

While the heading of this article implies that the furnaces should be located in Alberta it might, perhaps, be found better to locate on the British Columbia side of the boundary. The proposition to which I wish to direct attention is the possibility of furnishing from the ores and coke of the Crow's Nest district a local supply of pig iron for the prairie provinces and for the mining industry of southeastern British Columbia.

III.

Salt in the Prairie Provinces.

The prairie provinces are supplied with salt partly from the district bordering on Lake Huron in the province of Ontario, and partly from the United States salt from the latter source being subject to an income tax. The production of salt in Ontario in 1908 is given as follows: Sales, 79,975 tons value exclusive of packages $378,798, value of packages, $168,019. From these figures it can be calculated that the salt, as estimated by the producer at the point of production, is worth 23.7 cents per cwt., and the value of the packages 10.5 cents per cwt.

Freight from Windsor to Winnipeg by combined rail and lake amounts to 28.3 cents per cwt., and from Windsor to Edmonton to 63.3 cents per cwt. From this it is apparent that the cost of salt laid down in Edmonton is 97.5 cents per cwt., exclusive of the freight on the packages. At Winnipeg the cost is 62.5 cents per cwt. The actual cost of salt at Edmonton is thus a little over four times the cost of the same salt in Windsor. If salt could be produced at some central point in the west and the freight rate from Windsor to Winnipeg alone saved, the producer would have as his profit not only the profits of the producer in Ontario, but also the latter's whole cost of production.

The consumption of salt in the prairie provinces is unknown, but may be determined approximately as follows: The total consumption of salt in Canada for 1908 was 391,384,000 pounds. Assuming the population at that time to have been six million and a half, the consumption per capita was sixty-one pounds. The population of the three prairie provinces is to-day believed to be one million two hundred thousand, and the consumption of salt estimated on a basis of sixty pounds per capita would thus amount to 72,000,000 pounds per annum. If a freight rate of 25 cents per cwt. were saved on this consumption the saving would amount to $180,000 per annum.

In the west a number of salt springs are known which have furnished salt, of rather a crude character it is true, to the Hudson's Bay Company for many years. The most important of these are located along the shore of Winnipegosis Lake. James Monkman began working one of these as early as 1820. In the Geological Survey report of 1890, part E, the following springs are noted:

Salt Creek, west of Lake Dauphin.
Banks of Mossy River.
Salt Point, south of Lake Winnipegosis.
Monkmans Salt Springs, Red Deer Peninsula.
Pine Creek.
Pelican Bay, mouth of Pelican Creek.
Pelican Bay, west side.
Mouth of Bell River.
Salt Point..
Salt Point Peninsula, with salt near its base.
Salt Point Peninsula, north side of its base.
Mouth of Steep Rock River.
Lower Red Deer River, many places.
Banks of Shoal River.
Mouth of Swan River.

According to Mr. Tyrrell these springs have their sources chiefly in the Devonian rocks. The salt of the springs is thought to be derived from crystals of salt scattered through the rocks rather than from beds of pure rock salt. In Ontario the salt occurs in beds of the Upper Silurian period. Silurian and Devonian rocks extend from Lake Winnipeg northwest to the Mackenzie River. There are probabilities that actual salt beds exist as well as the springs referred to above. Boring will be required to determine this point and no definite inference can be made from geology that such beds of salt will be found. The probabilities are, however, strong. With an assured market for a large consumption and with a natural protection due to freight rates there should be sufficient encouragement to take up this enterprise.

EXPERIMENTAL WORK IN TREATMENT OF ZINC ORES.

(Contributed by E. Jacobs, Victoria, B.C.)

Last December a convention of mining men and others interested was held at Nelson, British Columbia, to consider the question of the best course to take to secure the making of experiments in the treatment of zinc ores, especially of ores in which zinc occurs in association with lead and iron. The attendance at that meeting was large and representative of the whole of the Kootenay district in particular, in which are known to exist great quantities of ore containing zinc, and this frequently with lead, in connection with which it is generally a detriment, since the shippers of such ores to lead smelteries are usually penalized when there is more than a certain percentage of zinc in the ore. The meeting unanimously adopted resolutions in effect petitioning the Dominion Government to make a sufficient appropriation to admit of experiments being carried on with a view to making the utilization of the zinc ores of British Columbia and other parts of the Dominion commercially practicable.

About a year earlier works designed to smelt lead-zinc ores by electro-thermic process, using the Snyder patented process, had been completed according to plans and a commencement had been made to smelt district lead-zinc ores, but, while a certain measure of success was achieved, working costs were high and results were not such as would bring profit to those concerned. The Provincial Government of British Columbia has already aided the undertaking by a substantial money loan ($20,000), so it was not reasonable to ask it for more. In January, 1909, a periodical general meeting of the Western Branch of the Canadian Mining Institute was held at Greenwood, and several members resident in Nelson and Slocan districts attended that meeting and secured the adoption there of the following resolution:

"Resolved—That this the Western Branch of the Canadian Mining Institute, in meeting assembled, hereby expresses its approval and appreciation of the action of the Federal Government, through its Department of Mines, in seeking a solution of the difficulties attendant on the economical smelting of eastern iron ores, by practical experiments in electro-thermic reduction, conducted at the public cost.

"In this connection this meeting recommends to the Government the desirability of aiding in and contributing to the advanced experiments which have already been made in British Columbia towards the separation and reduction of lead-zinc ores by electro-thermic energy. These experiments have demonstrated the practicability of the separation of metallic zinc from metallic lead, and its recovery as spelter from complex lead-zinc ores. Important deposits of such ores occur in this province and remain unworked through lack of economic reduction facilities. In the opinion of this meeting a solution of this problem will be of very great importance to the mining industry of the Dominion."

This resolution was duly communicated to the Dominion Government, but, so far as known to the writer of this article, no action was taken in this connection. The resolutions passed at Nelson late in 1909 were, however, persistently urged upon the Dominion Government, the entire cessation of work at the electric zinc smelter at Nelson having meanwhile taken away the hope previously existing that the difficulties in the way of continued operation of the works would be overcome. The outcome of this agitation and urgent representation to the Government was that an appropriation of $50,000 was made and the Mines Branch of the Canada Department of Mines was authorized to make enquiries into the subject and conduct such experiments as should be deemed desirable towards arriving at a solution of the difficulties of the situation. Since then little definite information had been made public in British Columbia as to what steps had been, or were being, taken in this important matter, so the occasion of the recent visit to British Columbia of the Prime Minister, Sir Wilfrid Laurier, was considered a suitable one to again press upon the attention of the Government the urgency of progress being made towards solving the problem of the reduction of zinc ores. Accordingly, the Kootenay-Boundary British Columbia Liberal Association adopted the following resolution, among others, for submission to Sir Wilfrid Laurier at the time of his visit to Nelson on August 29th:

"Resolved—Whereas the Dominion Government has appropriated for experimental work in the treatment of zinc ores, the sum of $50,000,

"And whereas in the opinion of this convention such appropriation is a wise and judicious one,

"And whereas British Columbia is the centre of the zinc industry in Canada,

"And whereas it is the opinion of this convention that such experimental work should be, as far as practicable, carried on in the country which will benefit from the results thereof;

"Resolved, that the Dominion Government be thanked for the appropriation already made,

"And further resolved, that the Government be urged to carry on the experimental work as far as possible in British Columbia."

The Nelson Daily News, from which the information relative to the adoption of the resolution, and the account of the statement afterwards made by Hon. Wm. Templeman, Dominion Minister of Mines, has been taken, did not state what the reply of Sir Wilfrid was. However, the matter was dealt with by Mr. Templeman at a public welcome to the Prime Minister and his party before they left the city on their return to Eastern Canada. The Hon. Minister of Mines is reported to have said:

"I may on this occasion make reference to a question in which the people of Nelson are, I know, all very deeply interested. Some years ago, at the request of the mining interests of the province, and particularly of this district, the Dominion Government secured the voting by Parliament of a sum of money as a bonus on the production of lead mined in Canada, which amount has not yet been exhausted. The production of lead during the years that have intervened has, I

believe, been maintained at a normal level. That bonus on lead has been of enormous benefit to the Kootenay district. I doubt whether without it the lead mining industry would have been as successful as it has been during the past five or six years. There has now come a time when the production of lead-zinc ores needs assistance. There are many mines in this part of the province producing low-grade ores of zinc and lead, and in numerous instances the zinc cannot be recovered profitably by reason of the difficulty of smelting zinc. An amount of $50,000 has been voted, and since I arrived here I have heard many enquiries as to how we propose to spend that money. This is, I think, a proper opportunity to explain what we have done and propose to do further in the matter. Our first step has been to secure the services of an eminent mining engineer in London to make a report upon all the electrical zinc-smelting processes at present known in Europe. That engineer, Mr. F. W. Harbord, is now engaged in that work. (Note by E. J.—Mr. Harbord is a prominent member of several influential mining and metallurgical institutes and other societies in England. He has large experience in iron and steel manufacture, in which he was for some years engaged in the Midlands. For 14 years he was consulting metallurgist to the Indian Government; afterwards he went into private practice, and in 1908 entered into partnership with Mr. Edward Riley, of London, an eminent metallurgist, analyst and consulting chemist. He is a well-known authority on electric smelting, has visited all the principal electric furnace works in Europe, and is the author of several papers on this subject. In 1904 he was consulting metallurgist to the Commission appointed by the Canadian Government to investigate the different electrothermic processes for the smelting of iron ores and the making of steel, in operation in Europe. In 1909 he was appointed by the Transvaal Government to report on the general metallurgical position on the Rand, especially in regard to the fuel question. He is external examiner in the Imperial College of Science and Technology, London, and examiner in metallurgical chemistry for the Institute of Chemistry. He has visited nearly all the countries of Europe; also the United States, Canada and South Africa. His firm—Riley & Harbord—makes a specialty of the examination and testing of iron and steel and other metals, fuels, iron, and manganese and other ores and minerals, copper and other alloys, cements, and the various materials used by railways and engineers generally. He is also the author of the standard book "The Metallurgy of Steel" and various technical papers read before technical societies. See the London Mining Journal's "Who's Who in Mining and Metallurgy.") We have also retained the services of Mr. Walter Renton Ingalls, New York, editor of the Engineering and Mining Journal, whose name is familiar to most mining men, I think, as the greatest zinc expert in America. We are, therefore, at the present time investigating. When we have the reports from these experts we will form a plan of procedure as to experimentation. I may say, we have received from the Canada Zinc Company, owning the zinc smeltery at Nelson, the entire record of the experiments carried on here for some months, which I believe resulted in a certain measure of success, but which were not entirely successful. This data is being considered by Mr. Ingalls, who will make a report upon it. It is proposed, as soon as we receive and consider all the information that can be obtained as to results achieved thus far in the electric smelting of zinc, to submit that evidence to the best experts we can find, the best metallurgists and chemists on the continent and to be guided by their advice as to the experiments we shall carry on. It is proposed by Dr. Eugene Haanel, director of the Canada Department of Mines, to, if possible, make the experiments in the zinc smelting process at the works at Nelson, provided, of course, the experts recommend it. I had a conversation with Mr. Ingalls, when I was in New York, and he thought in all probability it would be found expedient to take up the Snyder process and, if possible, try to bring it to success.

"Now, I want it to be distinctly understood that this is a difficult problem. We may succeed, or we may not. It may be that we shall spend all the money and not find the solution of this problem, but we know the enormous benefit that will result to this portion of British Columbia if a commercially successful process for smelting low-grade zinc ores shall be found. We are proceeding carefully; very little money has yet been expended. We shall procure the best advice obtainable and probably carry on experiments in a small way in other places where there are experts and small laboratories in which the work may be done on a small scale. Then, when we shall be in a position to attempt smelting on a commercial scale, the work will be carried on at the smelter at Nelson."

LONDONDERRY STEEL.

The five-ton basic open hearth furnace of the Steel Foundry Department, Londonderry Iron & Mining Company, Limited, Londonderry, N.S., is doing excellent work, and proving, so far as known, a world's record breaker.

The regular metallic charge is 12,000 pounds, of which 40 to 50 per cent. is local sand pig iron carrying 1.25 to 1.40 per cent. phosphorus, and occasionally as high as .2 per cent. sulphur. About 20 per cent. of limestone is used.

Heats have been made—from beginning to charge to tapping—in well under four hours, and excellent quality of castings, both chemically and physically, produced. When considered that the furnace is charged by hand, and charging alone takes about two hours, the work accomplished is all the more remarkable.

Owing to the intermittent character of operations common to steel foundry practice, only two heats per day of twenty-four hours are at present taken off; but everything points to a possibility, by continuous operation, of from thirty to forty heats per week of six days.

The furnace is built for producer gas with slag chambers underneath gas and air uptakes, and regenerator chambers under charging floor. The present fuel, however, is oil.

This is the only five-ton basic open hearth furnace in Canada and was designed and built by Mr. William Brown, the company's general superintendent, who also designed and built, assisted by Mr. Frank Smallwood, construction engineer, the entire steel foundry plant. Mr. Brown was for some years open hearth superintendent for the Dominion Iron & Steel Company, Limited, Sydney, N.S., and prior to that held similar positions with several of the leading United States manufacturers.

The death-rate among underground workers in the collieries of the United Kingdom during 1909 was 1.61 per 1,000 people employed, as against 1.46 in 1908. The death-rate of the surface workers was 0.67 per 1,000, as compared with 0.76 in the previous year.

OUR EUROPEAN LETTER.

Miners Assembled in Convention at Brussels. Important International Labour Proposals on Questions of Working Men Inspectors, Wage Agreements, Safety, Female and Child Labour, and the Eight-Hour Day. The London Mining Market. A Survey of the Position on the Rand.

(Exclusive Correspondence of CANADIAN MINING JOURNAL.)

London, August 19th, 1910.

Recently the mining engineers met in world's convention at Dusseldorf and the result was that all records were broken both of attendance and convention generally.

The working miner has just had his turn. In connection with the Brussels Exhibition the 21st International Congress of Miners opened on August 8th. Miners were the pioneers amongst trade unionists in the international organization of their craft, and British miners appear to have led the way. Sixty delegates attended on behalf of the Miners' Federation of Great Britain. The agenda prepared before the conference was a very full one. The appointment of working men inspectors with a practical knowledge of mining was the subject of two resolutions from Great Britain and Germany. The nationalization of mines was put down from French and Belgian sources. Three resolutions on the wages question came from Germany, France and Belgium, all containing indications of the influence of the international movement to secure for all mine workers those improvements in conditions which were obtained by the mine workers of any other special nation. France, Germany and Belgium had resolutions down seeking to secure wage agreements on similar lines to those ruling on the British coal fields.

The improvements of the methods of mining with a view to preventing accidents and securing the greater safety of the workmen was the subject of a resolution from the British miners. German miners were keen on the regulation and abolition of the employment of women and children in and about mines, and on these matters secured the undivided support of the British miners. Belgium, France and Germany all put forward resolutions on the eight-hour day, and there were four other resolutions relating to old age and invalidity pensions. France and Belgium both asked for the regulation of coal supplies, and other matters discussed were compensation for accidents, universal peace and annual holidays.

On the question of mining inspectors the German representative, Herr Friedrich Hooseman, described the German system of inspection, by which the workings are inspected twice a month by practical inspectors familiar with the method of working the mines. A feature of the German system is the appointment of a committee by the workmen at each pit, whose duty it is to make any complaints to the inspectors about the administration of the mines.

The method of appointing workmen inspectors in France was fully described by M. Cordier. The law under which workmen inspectors are appointed was passed in 1890, so the miners have had some twenty years' experience of the system. In the early days of workmen inspection there was stated to be a good deal of hostility on the part of the owners. The hostility was attributed to the fact that the workmen appointed as inspectors were men who had been foremost as trade union leaders, and consequently the employers regarded them as enemies. This feeling of hostility on the part of the owners has been gradually dying down. The terrible catastrophe which happened at Courriéres a few years ago was stated to be largely responsible for the improved feeling of the owners towards the system of workmen inspectors.

In Belgium there is also a law which provides for the appointment of workmen inspectors, but its operation is unsatisfactory to the workmen. M. Ballas explained to the Congress that these inspectors were appointed from a list drawn up by the Council of Industry and Labour, which consisted half of workmen and half of employers. The committee usually disagreed, with the result that the appointment had to be made by the Minister, who generally selected the owners' nominee.

For the first time in the history of the international movement Holland was represented at the Congress. Within the last few years mines have been sunk and coal has been raised in Holland near to the German frontier. The Dutch miners have formed a trade union. Another nationality new to these congresses followed in the person of M. Avramoff, of Bulgaria.

The debate on an eight-hour day was brief. No one opposed its legal enactment. Mr. Wadsworth, M.P., explained that in England this law had increased the number of miners employed, and had not reduced wages. It was too soon to know its effect on the frequency of accidents. A resolution in favour of an eight-hour law from bank to bank was carried unanimously.

In all the sections old age pensions were discussed and explanations were given concerning the position in each nation. Mr. Stanley, M.P., described the British system as an awakening of the public conscience, which promised many improvements on what already existed, particularly as the Chancellor of the Exchequer was meditating unemployment and sickness insurance.

On the subject of compensation for accidents all the speakers advocated the free choice by the patients of the doctor. A resolution was carried demanding that compensation should equal the entire loss of wages.

The miners of the Continent of Europe are eager to follow the lead of the British miners in the obtaining of wage agreements protected by a fixed minimum. The success of this method of dealing with wages in the British coal-fields has so impressed the coal miners of other countries that the Congress has discussed resolutions from Germany, France and Belgium asking for the regulation of wages by agreements containing a minimum standard.

The most interesting disclosure of the debate was the comparison of wages paid in the various coal-fields of Europe. As might be expected, Great Britain stands highest in the list. The figures given by Mr. Harvey showed wages at the present time in the British coal-fields to range between $1.48 a day in Scotland and $1.84 a day in South Wales, and the districts where wages are controlled by the English Conciliation Board. The present wage in France is $1.44 per day, in Germany $1.30 per day, in Holland from $1.14 to $1.20 per day, and in Bulgaria, which stands at the bottom of the list, the wages paid range from 28 cents to 48 cents for

12 hours, and in some cases 14 hours' work at the coal face.

Mr. Elfers, who represented the Dutch miners, frankly stated to the Congress that when they applied for a higher wage and quoted the wages paid in England, the owners told them "the economic condition of affairs in Great Britain is very different, and admits of things being done there which are not possible in Holland." The wages paid in the Belgian coal-field were not given, and though John Wilson, of Scotland, tried to obtain the figures, he failed to accomplish his purpose.

The president of the British Federation brought forward a proposal for further legislation to promote the safety of workers in mines. Mr. Edwards is a member of the Royal Commission on Mines, and with the labours of the Commission as yet incomplete he was somewhat handicapped as to what he was in a position to state publicly to the Congress, but he made so strong a case that the British resolution on the subject was unanimously accepted without discussion.

The Congress then proceeded to discuss the prohibition by-law of the employment of women in the mining industry and the raising of the age of boy labour. There is no direction in which greater strides have been made by the International Congress. When the first Congress was held at Jolimont, twenty-one years ago, large numbers of women were actually employed underground. This has been entirely prohibited while the number of surface workers has decreased.

The French representative stated that in the Calais district some 3,000 young women are employed in the loading of canal barges with coal. With a touch of gallantry he claimed that these girls were as fair and beautiful as any in Europe, but at the end of their day's work they were more like negresses than Frenchwomen. The German delegate stated that they had a law which prohibited the employment of boys underground before reaching 16 years of age, except on a medical certificate of physical fitness for the work. Some 4,000 boys were employed.

The Congress also discussed the quantitative regulation of the production of coal. The French and Belgian delegations, in agreement, demanded that in case of a general strike in a given country the Miners' Federations of the neighbouring countries should limit their production by determined abstention from work. M. Hooseman, a German delegate, remarked that the miners' organizations are not stable enough and sufficiently well organized to enable such a resolution to be put in force. He demanded that the proposal should be referred for supplementary consideration to the International Committee, and this proposal, after some discussion, was adopted. The Belgian delegation proposed then that the International Committee should allot an annual holiday of a fortnight for workers in mines in order to place a check on over-production. This proposal was adopted unanimously. Another proposal to the effect that the International Congress should meet henceforward only once in two years was rejected after long discussion.

The Congress concluded its sittings after having discussed the question of the regulation of the production of coal. The next Congress will be held in London.

* * *

Going back home it is good to see that the mining share markets have revived considerably despite the fact that the holiday period is now well with us. South Africans are slowly climbing into favour again and the more the situation is studied with respect to the Rand the sounder it appears. There is evidence on every side of steady progress being made, and in more than one direction there is probability of improved economy in working as time goes on. The latest information concerning stope drills points to the wide adoption of machines which will almost certainly effect a very considerable economy in development work. Whether this will have as wide an effect as is supposed in some quarters in the way of increased employment of whites is as yet a little dubious, but it would certainly seem that the position is full of possibilities in that direction. Providing that the training of white miners is carried on upon a sufficiently large scale, and in a rational manner as regards selection and organization, it would seem quite impossible that within a comparatively short period a far greater number of white miners will be available, well versed in the technique of stope drilling.

Again, we are unquestionably at the beginning of a period in which the Rand mines will be able to get their power supply very much cheaper than has been the case in time past. The actual cost for a given amount of energy is likely to be decidedly less, and at the same time there will be the facility for using electrical power in many positions where hitherto it has not been dreamt of. How far underground work may, with advantage, be done by electric installations is yet quite an open question, but judging from the success which has attended electrically-driven mining equipment in the United States, it is quite within the bounds of probability that revolutionary changes may come about on the Rand in this connection. The supply of colored labour, though it will always, of course, be subject to fluctuations, appears on the whole to be quite reliable as between one year and another, and the effective value of the "boy" is, beyond doubt, increasing. Slowly, but surely, his habits are getting more businesslike, and there is less difficulty in teaching him his lesson than formerly. This must be put against the fact that if there is any change in the rate of wages paid to the native underground workers, the change will be upwards, and not downwards. When taking a survey of the probabilities concerning Kaffirs, extending over, say, the next twelve months, the East Rand field is not likely to be omitted from consideration.

SUCTION GAS PLANTS IN SOUTH AFRICA.

An interesting paper on "Suction Gas Plants" was read by Mr. H. W. Miller at the last meeting of the South African Association of Engineers, Johannesburg, which may be of particular interest to those having power plants to install where there is a scarcity of water or where conditions prevail rendering the adoption of suction gas plants advisable.

The instance taken was for lighting the town of Bethlehem, in the Orange Free State, South Africa, oil engines being first adopted, three-cylinder, three-crank high-speed vertical engines direct coupled to the dynamo. Three-wire system, two generating machines of 250 volts each, driven tandem fashion, output 20 kilowatts, but the high price of paraffin oil (12s. 6d. a case) was considered a drawback, and when it became necessary to install a larger plant, suction gas engines coupled direct to the dynamos, were adopted. Single generator was decided on, a single 500-volt machine with a static transformer to give 250 volts on the outside lines, being directly coupled to a gas engine of a rated horse power of 600 h.p. The capacity of the plant is 58 kilowatts at a speed of 190 revolutions per minute. One feature was the placing of the producer in a separ-

ate room with the party wall taken up to the roof, thus keeping the engine, dynamo and switchboard as clean as possible.

Prior to the installing of the gas engine the consumption of oil by the oil engine averaged about two cases of paraffin oil per night, so that the average costs for fuel and lubricating oils was about 25s., and as the units generated per month were only from 1,500 to 1,600, the costs were extremely high.

The gas engine installed is a horizontal on the Otto cycle cylinder, 16½ inches in diameter, stroke 23 inches. Two classes of fuel were used—wood charcoal to start and afterwards a low class anthracite coal from Dundee, Natal, of the following composition: Mixture, 2.08 per cent.; volatile matter, 9.40 per cent.; fixed carbon, 72.64 per cent.; ash, 15.88 per cent.; combustible matter, 82.04 per cent.; sulphur, 3.34 per cent.; with a theoretical calorific value of 12,250 B. T. units. The cost of the anthraule coal first used was £1 6d. per ton, and of the charcoal, 50s. per ton of 2,000 pounds.

The following is a record of one week's running:

Number of hours run, 32.
Number of units generated, 368.8.
Coal consumed, 1,949 lbs.
Quantity consumed whilst engine was working, 1,742 lbs.
Quantity consumed while standing by producer, 207 lbs.
Gross amount consumed per unit generated, 5.3 lbs.
Nett amount consumed per unit generated, 4.72 lbs.
Gross cost of coal per unit, .66 pence.
Nett cost of coal per unit, .59 pence.
Average number of units generated per hour, 11.5. units.
Average cost of coal per evening, 34.82 pence.
Cost of fuel for the week's run, 19s. 11¾d.

The cost of this work with the oil engines that this plant superseded would be £7 10s., representing twelve cases of paraffin oil at 12s. 6d. per case.

Consumption of oil during the trial run was 4 pints of cylinder oil and 16 pints of machine oil, the plant being new, oil was liberally used.

The results for the four months, March, April, May and June, were as follows:

Number of units generated, 9,229.
Anthracite coal used, 35,500 lbs.
Charcoal used, 11,500 lbs.
Cost of coal, £25 6s.
Cost of charcoal, £14 7s. 6d.
Weight of fuel burned, 47,000 lbs.
Cost of fuel burned, £39 13s. 6d.
Cost of fuel per unit generated, 1.031 pence.

During these four months coal had increased in price to 23s. 6d. per ton of 2,000 lbs., and charcoal to £2 19s. 8d. per ton.

The consumption of oil and stores during the four months of March, April, May and June, were as follows:

Cylinder oil, 29 gallons at 6s.....	£8	14s.
Engine oil, 28 gallons at 2s. 6d.....	£3	10s.
Miscellaneous stores	£2	10s.
	£14	10s.

This is equivalent to .382 pence per unit generated. The total costs per unit generated for fuel and stores were thus 1.413 pence. Cost of same work with the oil engines would have been £167 16s. for the four months, as against £54 7s. 8d. for the suction gas plant, an annual saving of £340. The total cost of the suction gas plant was £2,400, of which buildings represent £900.

Another instance was given of the working of a small pumping plant at Bellbron by suction gas, where, working eight hours, 19,000 gallons of water were pumped into a reservoir from a borehole against a head of 175 feet, consumption of anthracite coal being 12½ lbs. per hour, costing 37s. per ton. Pump horse power works out at 2.12, so the consumption of coal per pump was 6 lbs. The pump was meter-driven consumption 45 units, equal to 5.625 units per hour. Quantity of electrical energy per pump horse power was thus 2,653 units or 3.56 electrical horse power. Total horse power being 60.5, the consumption of coal was 1.65 lbs. and per pump horse power, 5.88 lbs. Costs come out at one farthing per horse power hour, 81.3 pence per pump horse power hour.

Mechanical efficiency of pumping plant and motor works out at 28 per cent. Cost of pumping for fuel being only 1.16 pence per 1,000 gallons, so that the consumption of fuel per brake horse power may be calculated at 1.3 lbs. of coal.

Professor Dobson in moving a vote of thanks to the author pointed out that at Bethlehem the cost per unit for fuel, stores, wages, capital charges and water, but excluding costs of supervision and distribution was 5.6 pence per unit, a sufficient inducement for small municipalities to adopt these suction gas plants.

IMPORTANT COPPER MINES.

Messrs. Thompson, Towle & Company, of 15 Broad Street, New York, have prepared and published an elaborate table showing the production, estimated earnings, and dividend rate of most of the important copper mines of the United States, Mexico and Canada. There are 55 dealt with, and of these only two are Canadian, namely, those of the British Columbia Copper and Granby Companies, respectively. The particulars given relating to these are as follows: British Columbia Copper Company—Location of mine, near Greenwood, Boundary district; company controlled by Newman Erb; general office, New York, U.S.A.; present rate of copper production, 10,000,000 lbs. per annum; prospective rate of production within two years, 15,000,000 lbs.; estimated cost per lb. of copper, 8½ cents; number of shares issued and par value, 591,709 at $5; estimated earnings per share, with copper at 11 cents per lb. 42 cents, at 12 cents per lb. 59 cents, at 13 cents per lb. 76 cents, at 14 cents per lb. 93 cents, at 15 cents per lb. $1.10, at 16 cents per lb. $1.27; high and low quotations for stock, in 1906 $15 and $12.50, in 1907 $14.75 and $3.25, in 1908 $8.50 and $3.87, in 1909 $9.00 and $5.87, in 1910 $8.75 and $4.75; last dividend paid in September, 1907, amount 40 cents per share.

Granby Consolidated Mining, Smelting & Power Company—Location of mines, at Phoenix, Boundary district; company controlled by American Metals Company; general office, New York, U.S.A.; present rate of copper production, 24,000,000 lbs. per annum; estimated cost per lb. of copper, 10½ cents; number of shares issued and par value, 148,500 at $100; estimated earnings per share, with copper at 11 cents per lb. 81 cents, at 12 cents per lb. $2.41, at 13 cents per lb. $4.03, at 14 cents per lb. $5.63, at 15 cents per lb. $7.24, at 16 cents per lb $8.86; high and low quotations for stock, in 1906 $150 and $93, in 1907 $152 and $60, in 1908 $109.50 and $78.75, in 1909 $110.50 and $91, in 1910 $111.75 and $20; last dividend paid in December, 1907, amount $2 per share.

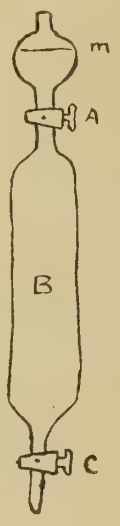
ESTIMATION OF NICKEL AND COBALT.*

BY C. W. BADGLEY.

Dissolve 1 gram of HCl and HNO_3 in a 250 c.c. beaker and evaporate to dryness. Take up with HCl and dilute to 150-200 c.c., make alkaline and then just slightly acid with HCl. Now pass H_2S through the solution to precipitate any Pb, Cu, As, etc., that may be present. Filter, wash and then boil the filtrate till all H_2S is expelled. Add a few crystals of $KClO_3$ to oxidize the iron and boil for few minutes. Dilute and make ammoniacal and filter. If much iron is present, as in a matte or speiss, it is best separated by the ether method—see below. If there is not much iron the precipitate of the hydroxides may be dissolved in HCl and reprecipitated repeating this three or four times till the iron no longer holds back any nickel. (Shown by evaporating the solution of ferric chloride down almost to dryness in a casserole, any nickel, if present, will show decidedly green.) Or the iron may be more cleanly separated by the basic acetate separation if zinc is not present. If zinc is present the sodium acetate prevents its separation later on.

Combine the several filtrates and make just neutral with HCl using methyl-orange, pheno-phthalein or litmus as an indicator. The solution should be concentrated to 150 c.c.

If zinc is present, add two drops of HCl to the neutral solution and 5 grams $(NH_4)_2SO_4$. Heat the solution to 50 degrees C and saturate with H_2S. If difficulty is experienced in obtaining this precipitate some of the free HCl may be neutralized by adding a few drops of a very dilute solution of sodium acetate, but not sufficient, however, to neutralize all the HCl, or nickel and cobalt will also be precipitated, shown by the formation of a grayish to blackish precipitate.



Allow the beaker to stand covered in a warm place for some time, till the ZnS settles and the upper liquid is clear.

Filter and wash the ZnS with hydrogen sulphide water which contains in every 100 c.c. 2 grams of $(NH_4)_2SO_4$ or NH_4Cl. Heat filtrate to 70°-80° C, add 10 c.c. strong solution of ammonium acetate and pass H_2S through the solution which should completely precipitate the nickel and cobalt as sulphides and leave any manganese in solution. Filter and test the filtrate by adding excess ammonia. If this darkens the filtrate repeat the precipitation with H_2S, etc., and combine the precipitates.

Dissolve the precipitated sulphides with HCl and a little HNO_3 and take carefully to dryness. Take up with water and 5 to 10 c.c. H_2SO_4. This is preferable to fuming with H_2SO_4, as in that way a basic sulphate of nickel is formed which is very slow to go into solution. Cool and then make strongly ammoniacal and if any precipitate of iron or aluminium is formed it must be filtered off. To filtrate add from three to five grams of $(NH_4)_2SO_4$ and NH_4OH in large excess and electrolyse over night with a current of 1-2 ampere.

Separation.—Dissolve the weighed nickel and cobalt from the platinum cylinder with hot HNO_3, as small amount as possible being used. Evaporate to dryness. Take up with 4—5 drops HCl and 20—30 drops water and then add 2—3 grams of pure potassium nitrate dissolved in the least possible amount of water, acidulated with acetic acid and filtered if necessary. The presence of cobalt is shown by the formation of a bright yellow precipitate. Stir the solution thoroughly and allow to stand 24 hours in a warm place with occasional stirring. Filter on a small ashless paper, wash with water containing potassium acetate and a little free acetic acid, remove the filtrate containing the nickel and wash the precipitate and filter free from potassium acetate with alcohol. Ignite the precipitate and paper carefully in a porcelain crucible, care being taken not to raise the temperature high enough to fuse the precipitate. Transfer to a small beaker, and digest in nitric acid and sulphuric and evaporate to fumes. Add 5 c.c. water and excess ammonia or ammonium sulphate and electrolyse.

Heat the filtrate from the cobalt to boiling and add a slight excess caustic potash, boil a few minutes, filter and wash with hot water. Dissolve the precipitate through the paper with HCl, make the solution neutral with ammonia, add 2 drops HCl 10 c.c. ammonium acetate, heat to 70—80 degrees C and precipitate with H_2S. Filter with H_2S water, dry and ignite. Allow to cool, add a little ammonium carbonate and heat again to dull redness to volatilize any sulphuric acid that may be present. Cool and weigh as NiS or NiO_2 which contain 78.55 per cent. Ni. This precipitate is generally pure, but may be tested for insoluble and iron which should be deducted.

Separation of Iron by Ether.

Dissolve the thoroughly washed precipitate of ferric hydroxide and included nickel and cobalt, etc., with HCl and evaporate to syrupy consistency. The solution should have specific gravity of 1.100 to 1.105 for the most satisfactory separation. The tube shown is well adapted for the treatment with ether. It consists of bulb B of 200 c.c. capacity, about 8 inches long and 1 1-2 inches diameter, with stopcocks A and C at the ends. The upper one connects with a bulb D of 100 c.c. capacity with a line at m to show when the bulb contains 30 c.c.

Close both stopcocks, pour a few drops of ether into upper bulb, open A and allow the ether to run into B. Close A and warm B with the hand. Open and close C. This will make a partial vacuum in B. Transfer the solution of the chlorides to the bulb D, washing it out of the beaker with HCl (SpG 1.10) and filling D to mark m. Stand the tube in a vessel of cold water, open A and let the solution run with B. Close A and

fill bulb D with ether. Allow the ether to run slowly in B so that it forms a separate layer over the other solution. Mix the solutions by giving the tube a circular motion keeping it cool in the meantime by a jet of water playing on it, to prevent any of the ferric chloride being reduced by the ether by a rise of temperature. Finally close A, shake the tube well, open A to relieve the pressure, return the tube to the jar of cold water and allow it to stand for some minutes to give the liquids opportunity to separate. The upper stratum is the ethereal solution of the ferric chloride and the lower the hydrochloric acid solution of the other metals with usually 1 per cent. of ferric chloride. Open C, allow the lower solution to run into a small beaker, close C, and wash the end of the tube with a little water. Introduce about 10 c.c. HCl (1.10 SpG) into D and allow it to run into B. Close A, shake apparatus and allow it to stand for a few minutes. Allow the lower liquid to run into the beaker which will now contain all the nickel and cobalt. Heat this solution to drive off the ether dissolved in it, add some HNO_3 and evaporate to dryness. Take up in HCl dilute—make slightly ammoniacal—boil, filter and wash. Redissolve the iron precipitate and repeat the operation, adding the two filtrates together. Add these filtrates to the filtrate from the original hydroxide precipitate and proceed as before described.

---

*Paper read before the Colorado Section, June meeting.—Western Chemist and Metallurgist.

PRECIPITATION.

An interesting paper on the subject of precipitation was recently read before the Chemical, Metallurgical and Mining Society of South Africa by Mr. F. D. Phillips, giving the results of samples taken of the solution entering and leaving the separate compartments in some of the extractors at the Knights Deep Gold Mine, the object of the observation being to ascertain what work was carried out by each compartment, and whether it was possible to reduce the consumption of zinc.

First experiment is shown below being the result of sampling a strong extractor two days after dressing. Rate of flow 1.54 tons of solution per cubic foot of zinc in 24 hours. Strength of solution 0.029 per cent. KCN, NaOH 0.005 per cent.

No. of Compartment.	Entering dwt. per ton.	Leaving dwt. per ton.	Extraction dwt. per ton.	Per cent. Extraction.	Per cent. Extraction of Original Value.
1	2.56	0.48	2.08	81.2	81.2
2	0.48	0.14	0.34	70.8	13.3
3	0.14	0.06	0.08	57.1	3.1
4	0.06	0.03	0.03	50.0	1.2
5	0.03	0.01	0.02	66.6	0.8
6	0.01	0.01	....	....	....
7	0.01	0.01	....	....	....

The author desires to know why precipitation falls off at the lower compartments, varying, as is seen above, from 81.2 per cent. extraction in the first compartment down to as low as 50.0 per cent in the lower.

As the result of the above experiment it was decided to dispense with the seventh compartment. Another series of samples were taken after a run of fourteen days, rate of flow 1.46 tons of solution per cubic foot of zinc per day of 24 hours, strength of solution 0.035 per cent. KCN., NaOH 0.0051 per cent. with the following results:

No. of Compartment.	Entering dwt. per ton.	Leaving dwt. per ton.	Extraction dwt. per ton.	Per cent. Extraction.	Per cent. Extraction of Original Value.
1	2.87	1.19	1.68	58.5	58.5
2	1.19	0.75	0.44	37.0	15.3
3	0.75	0.24	0.51	41.3	10.8
4	0.24	0.06	0.18	75.0	6.3
5	0.06	0.04	0.02	33.7	0.7
6	0.04	0.02	0.02	50.0	0.7

This experiment showed that although the value entering was 0.310 per cent. dwt. higher than in No. 1 experiment the extraction was 22.7 per cent. less in the first compartment, probably due to the solution not coming in contact with the zinc shavings. It may be mentioned that the five strong boxes were run a further three days before dressing, and, although it is here quoted that a tail of 0.02 dwt. was shown, the average of the five for the seventeen days was only 0.01 dwt., so that the working with six compartments in place of seven was considered as quite justified.

It was next decided to try a lighter packing of zinc, 330 pounds per compartment or 18.3 pounds per cubic foot, in place of 420 pounds or 23.3 pounds per cubic foot as formerly. The solution entered at 0.28 dwt., rate of flow was 1.88 tons per cubic foot of zinc per 24 hours, strength of solution 0.014 per cent. KCN., NaOH 0.006 per cent.

No. of Compartment.	Entering dwt. per ton.	Leaving dwt. per ton.	Extraction dwt. per ton.	Per cent. Extraction.	Per cent. Extraction of Original Value.
1	0.28	0.08	0.20	71.4	71.4
2	0.08	0.06	0.02	25.0	7.1
3	0.06	0.04	0.02	33.0	7.1
4	0.04	0.02	0.02	50.0	7.1
5	0.02	0.02	....	....	....
6	0.02	0.03	....	....	....

Here it will be seen that the first compartment did practically all the work, the following three compartments precipitated the same amount, namely, 0.02 dwt., the last two were useless. The system of lighter packing was also tried on the strong and slime extractors, but proof soon came from the assay reports that the system would not work except with a very high tail value, so the conclusion was arrived at that the lighter packing was inefficient and the larger weight was again resorted to.

A slime extractor was next taken and the results showed that the first compartment was in greater evidence than either the strong and the weak resulting in a precipitation of 88.9 per cent., leaving only 0.04 dwt. for the last three compartments, each of which extracted 0.01 dwt. Boxes have a capacity of 22 cubic feet to each compartment, amount of zinc 19.5 pounds per cubic foot. Rate of flow, 2.05 tons per cubic foot of zinc per 24 hours, strength of solution, 0.008 per cent. KCN., and 0.012 per cent. NaOH, sampled seven days before dressing.

No. of Compartment.	Entering dwt. per ton.	Leaving dwt. per ton.	Extraction dwt. per ton.	Per cent. Extraction.	Per cent. Extraction of Original Value.
1	0.36	0.04	0.32	88.9	88.9
2	0.04	0.03	0.01	25.0	2.8
3	0.03	0.02	0.01	33.3	2.8
4	0.02	0.01	0.01	50.0	2.8

It was considered that the dressing of these boxes could not be improved upon so they remain as before.

Regarding the cost, it will be readily understood that it would be unwise to try and obtain a very low tail value at a cost exceeding the value recovered, so some calculations were made to find out what the expense would be to precipitate on a value leaving the boxes

at 0.02 dwt. Taking an average over the twelve months ending March last, the figures including power, zinc, white and native labour, solution pumps, lead acetate and smelting, the cost came out at 0.75 dwt. per ton of solution precipitated. It will thus be seen that in precipitating at a tail value of 0.02 dwt. we were well in hand and could even afford to fill an extra compartment with zinc in each box—not a small item when it is considered that we have forty boxes in the extractors house at the Knights Deep Mine.

ELECTRICAL TRANSPORT ON THE RAND.

In view of the almost general exclusive use of electrical power that is expected to occur at the end of the present year on many of the Rand mines, and its probable extension until the use of steam as a motive power has been practically abolished, the paper read by Mr. W. C. Brown before the South African Institute of Electrical Engineers comes at an opportune moment. The writer pointed out that the principal points of a transport scheme adopted must depend upon the output, working hours, length of track and gradients. With these points settled, the proper size of locomotive can be determined, as well as other details, while the success of the scheme will depend upon the type of motor selected, the choice lying between direct current series, polyphase induction and single phase alternating current motors.

The direct current series are so well known as not to need description, but something may be said regarding the polyphase motor, its superior points being superior design, freedom from breakdown, low costs of maintenance and general reliability. It has, however, many disadvantages when used for traction work, the overhead construction is expensive, requires two trolley lines, double sets of insulators, and heavy poles. Speed control of a polyphase motor is limited, the starting torque is inferior to the direct current series motor in addition to other minor disadvantages.

The single-phase motor has a large field of usefulness before it where moderate distances have to be covered. It is better than the polyphase and closely resembles the direct current series motor in its characteristics. Its efficiency is about eight per cent. lower, but in long lines increased efficiency can be obtained by using high voltages, which, however, under some circumstances, may become dangerous. For the Rand conditions, however, the author considers that the best type of motor to use would be the direct current series type.

Two 20-ton locomotives could haul the ore for a 400-stamp battery, and eight or nine tube mills in two 8-hour shifts, from say 4 shafts, the farthest shaft not being more than a mile, providing the track is fairly level. Where steep gradients are encountered, the following formula can be applied:

$$\text{Drawbar Pull} = W.\ X. \pm \frac{W.2240}{N}$$

Where W = tons; X = track resistance, and N = inclination (1 in N).

The useful work of the locomotive may be regarded as .7 of the input at the motor terminals. The complete formula for total horsepower being in this case:

$$\frac{1.42}{S} \left(W.X. \pm \frac{W2240}{N} \right) = \text{H.P.}$$
$$33{,}000$$

Where S = speed in feet per minute.

Drawbar pulls can be obtained approximately from the volts and amperes input as follows:

$$\text{Drawbar Pull} = \frac{A.V.}{.746} \times 33{,}000 \times 0.7$$
$$\frac{\text{M.P.H.} \times 5280}{60}$$

Where A = amperes; V = volts, and M.P.H. = miles per hour.

Maximum starting effort a mining locomotive is capable of exerting is in pounds approximately weight of locomotive in pounds x .25, while the normal drawback pull can be taken as weight of locomotive in pounds x .18.

Many arguments can be brought forward as to whether a single unit of 50 tons or two of 25 tons each running in tandem as one unit should be employed. Both have their advantages and disadvantages, but the author considers that the tandem arrangement was most favourable for mining work.

Hitherto the gauge used on these fields had varied from 18 inches to 30 inches, but now that huge mills are being erected in these fields needing rapid transport, better results would accrue from the use of the local standard railway gauge of 42 inches, and, naturally, heavier rails must be used, as a scheme however excellent in other respects might prove a failure if the rails were too light. Steel tyred wheels are to be preferred to chilled iron wheels, as the former will last three times as long as the latter. Triangles for reversing purposes ought in all cases to be provided. Good shed accommodation is essential, and cleanliness in all direct current machines is necessary, but doubly so in a railway motor, neglect of which might lead to disaster.

In practice it is found to be satisfactory if the converter output is .5 of the total output of the locomotives where four or five are in use.

An instance was given of a railway where the gauge was 30 inches, rails 45 pounds, three locomotives of varying size used, weight of empty trucks 1.1 ton. Tons hauled per month, 106,920; cost per ton mile, 1.66 pence; maintenance cost per ton mile, 0.66 pence.

Cost of current, .75 pence per K. W. H. The operating cost might seem high, but this was due to the grade being 1 in 40, if the grade was level the cost would be 0.74 pence per mile. Three rotary converters 85 horsepower each, are installed, two of which are run in parallel, while the third is a standby.

The 20-ton locomotive consists of two 10-ton units coupled together and run in tandem. Each unit is equipped with two 45 horse power, 500-volt series motors. Steel tyred wheels, 33 inches in diameter, are used, the gear ratio being 5.78. The locomotives are electrically coupled by means of flexible conductors and multiple plugs, by means of which the locomotives can readily be uncoupled if required. Total drawbar pull, 7,000 pounds. Speed, 8.3 miles per hour.

Underground electrical traction has not come into extensive use as yet in these fields, but under the influence of the larger scale operations now in vogue and the better underground conditions, it cannot be expected to be long delayed.

Nova Scotia's output of gypsum during 1909 was 299,045 tons. Eleven concerns contributed to this. Only two or three of the operators attempt to turn the gypsum into manufactured products.

PRELIMINARY NOTES ON GEOLOGY OF THE PORCUPINE DISTRICT OF CANADA.

By A. A. Hassan.

Introduction.

Though the presence of gold in small quantities was known in the vicinity of Night Hawk, Porcupine and Miller Lakes as far back as the year 1896, not much prospecting was done here, until a year ago, when a man by the name of George Bannerman uncovered a quartz vein containing visible gold (June 12th, 1909) in the Township of Whitney, and in less than one year about eight townships have been staked.

For different reasons gold finds and gold mining in Ontario and other provinces of Canada have met with little success, and the mining world at large

A 2-Stamp Mill on Timmins' Property

held a very skeptical view about Porcupine gold finds. Nevertheless, the prospectors continued the search and the assessment work persistently, with the result that they made spectacular gold finds on and near the surface.

The persistent and quiet work has proven very beneficial to the district, as wild-catting was entirely eliminated.

Though about 40 miles away from a railroad, transportation being by boats and canoes over lakes and rivers, and by tramping and packing over the trails, there are now at least six plants in active operation and numerous shafts are being sunk. At this writing one three-compartment shaft is down one hundred feet, showing good gold values.

The accompanying photographs give a good idea about the vein outcrops, and the character and topography of the country in general.

Topographically the country is rather undulating flat ground with occasional swampy depressions. Some higher ridges and knolls are covered with a dense growth of moss and timber. The quartz outcrops are found mostly in the higher places, which makes prospecting comparatively easy.

Water is obtained from the several lakes, numerous springs and swamps.

Geology.

The whole make-up of the country rock, through which the quartz lodes, dikes, or veins came up, is of an ancient Keewatin or Pre-Cambrian Age, probably of the Algonkian Period. This Keewatin is highly metamorphosed.

Dome Mining Co.

The associated pegmatites contain gold in varying quantities, graduating insensibly into granitic rocks in the outlying districts.

However, the most important phenomenon, the guide for the prospector and the inexperienced gold hunter, is the presence of great bodies of schists, and especially of the green chlorite schist, which has developed from the darker horn-blende schist.

There appears to be no doubt that a regional metamorphism took place in this part of the country, having a strike of northeast and southwest, and the accompanying dynamic pressure changed the rocks in the lines of weakness to a schistose condition.

The quartz with the gold-bearing solutions was intruded afterwards in this prepared ground of schistosity.

As the several lines of regional metamorphism run almost parallel, striking northeast and southwest, the lines of weakness have been developed almost at right angles to the regional metamorphism, striking east and

west, and in some instances northwest and southeast, where most of the quartz veins are found.

Which gold surface showings will become gold mines is at present impossible to predict and only actual development work conducted under the direction of capable mining engineers of wide experience in gold mining, can prove the existence of paying gold mines.

The most interesting and characteristic occurrence in Porcupine district in relation to the deposition of the veins, lodes or dikes, is the fact that in some cases the quartz has overflown the schists, and in other cases the schists have overlapped the quartz. Some of the sup-

Five Shafts.

posed quartz veins found on the surface will prove only schist in depth, and vice-versa, the schist on the surface will give place to quartz in depth.

If the gold values are persistent at depth, as the Timmins three-compartment shaft has proved at a depth of 100 feet, Porcupine should have a future as a gold camp.

At this writing the Dome Mining Company also claims good gold values at a depth of 70 feet and the diamond drill cores show visible gold.

Timmins' Quartz Outcrops.

During my visit a domelike quartz vein has been uncovered with spectacular gold showings on one of the claims in Tisdale, and almost every day some surface gold finds have been made either in Tisdale and Whitney Townships, or in the Forest Reserve.

On certain claims in Tisdale Township two men obtained visible gold in every instance after each blast. Sampling is a very difficult task owing to the irregular width of the veins, as some will widen out to 30 or more feet and abruptly narrow down to several inches or disappear in some swamp and come up again in a distance of 100 feet or so.

To get an idea of average gold values on the surface is almost impossible and only prospecting pits and shafts can give more approximate estimates.

In some instances the schist or the carbonates enclosing the quartz outcrops will assay much higher than the vein quartz itself, like in the case of the Scottish Ontario Gold Mining Company.

The Curtis or Foster vein is unique, showing transverse bands of quartz with visible gold on the surface for considerable distance. The walls are well defined in the schist, being from 10 to 20 feet wide. The accompanying photographs show the vein after trenching.

There is another smaller vein on the Foster which is opened up to a depth of about 25 feet with an incline shaft. The quartz with enclosing schist appears to be well defined.

At Oldham, Halifax County, Nova Scotia, the Oldham Sterling Gold Company obtained 2,710 ounces of gold from 940 tons of ore, an average of 2.88 ounces per ton.

In 1872 Nova Scotia derived $59,155 from royalties on coal mined in the province. This amount stands in contrast to the sum received two years ago, $616,933. At the time of the organization of the Dominion Coal Company, the royalty amounted to $142,058. One year later it jumped to $209,830. That was sixteen years ago. The increase has been constant, with the exception of a few "strike" years.

Returns to the Bureau of Mines show that the output of the metalliferous mines and works of Ontario for the six months ending June 30th, 1910, was as follows:

	Quantity.	Value.
Silver, ounces	12,804,992	6,260,197
*Cobalt, tons	189	35,657
Copper, tons	4,634	660,497
Nickel, tons	9,339	2,005,660
Iron ore, tons	39,497	113,082
Pig iron, tons	221,718	3,540,688
Zinc ore, tons	576	5,000

*Only cobalt paid for included.

Shipments from silver mines aggregated 14,787 tons, of which 12,024 tons were of ore and 2,763 tons of concentrates. The former averaged 814 ounces of silver to the ton and the latter 1,017 ounces. Gowganda contributed 334 tons of ore containing 317,925 ounces of silver, and the Lake Superior district a small production, the remainder being from Cobalt proper.

The production for the corresponding period of 1909 was 11,234,382 ounces of silver, valued at $5,379,980.

The nickel-copper mines of Sudbury turned out 9,339 tons of nickel and 4,634 tons of copper, as compared with 6,027 tons of the former and 3,741 tons of the latter for the same period last year, an increase of 52 per cent. and 42 per cent. respectively.

The production of pig iron as compared with the first six months of last year does not show a very large increase, the figures being 221,718 tons, having a value of $3,540,688, as against 211,583 tons valued at $3,197,759 in 1909.

STANDARDIZATION OF ENGLISH IN TECHNICAL LITERATURE.

[Editor's Note.—We reprint herewith a communication from a bulletin of the Institution of Mining and Metallurgy. The character of the paper that caused the disturbance is sufficiently indicated by Mr. Rickard's reply, as is also the nature of the various criticisms.]

AUTHOR'S REPLY TO DISCUSSION.

Mr. T. A. Rickard: Criticism is a compliment, even when intended to be otherwise. Thus I accept Mr. Pratt's corrections and remarks as indicating, at least, a keen interest in the subject. So far, so good. He has put my contribution through the fine sieve of his intelligence and has detected several blunders, but not as many as he claims. Some are typographical errors for which I hope to be absolved; to others I plead guilty, cheerfully.

In turn the critic makes mistakes to which I might advert, but the *tu quoque* would be wearisome and would serve no purpose, for it misses the aim of this discussion, which is not to furnish models of correctness but to lay stress on the need for intelligent interest in the subject.

It may be, as Mr. Pratt says, that my "paper is worse than the average in the matter of careless or incorrect writing"; of that my readers can judge. If it be so, it will serve as an excellent warning to those that aim at perfection. But I confess that if I were to wait until my own statements could be expressed in perfect English, I would have to postpone a useful task until the Greek kalends; on the contrary, I deem it best in speech that may be burdened with blemishes to face the searchlight of criticism, in the hope of performing a practical service with such clumsy tools as may be available. The beam in my eye may look big as seen through the distorted vision of Mr. Pratt's optic, but I despair of the day when I shall possess a vision wholly unimpaired.

For the fun of it, however, I shall make a brief reply to my critics. In the first place, I am charged with breaking an elementary rule in beginning a sentence with a conjunction. It must be remembered that my paper was intended to be read before a meeting; the conjunctions to which objection is made perform their proper function, namely, to indicate the relation of one thought to another. It is an obvious blunder to say that it is "an elementary rule of English composition" that conjunctions "should never be used to begin a sentence," for sentences are normally joined by this part of speech, the second or dependent sentence necessarily beginning with a conjunction.

Whether in referring to three words it is better to say: "All three of them ought to be scrapped" or "All three of these words, etc.," it is not profitable to discuss. For 'sloppy' and 'scrapped,' I do not apologize. As Mr. Sulman says: "It behooves us to watch that our zeal for linguistic purity does not lead us into a campaign of phrase emasculation."

"Suppositious technical article" is open to correction, but I do not like 'suppositiously'; 'supposedly' is better. It becomes advisable to reconstruct the sentence and write: "In an article supposed to be technical."

As to the illuminating remarks on the obviously satirical use of 'inspiring' in connection with words like 'muck' and 'mucker,' I have only this to say, that a joke apparently is not a joke when told to Mr. Pratt.

Mr. Sulman's observations are keenly appreciated. The delicate humour is particularly welcome in the treatment of a subject always in danger of being dulled by pedantry. Mr. Sulman and I shall continue to disagree in regard to the use of preposition-verbs, but we shall not impute all manner of iniquity to each other because of this little difference. I venture, however, to say that there are few preposition-verbs that cannot be replaced advantageously by a verb composed of a single word. Thus the alternative to 'come out from' is not 'emerge,' which may or may not be "journalese," but 'escape.' Thus "we can escape from our inflectional thraldom." Mr. Sulman deliberately 'gets over' a difficulty that I should preferably try to 'overcome.'

Of course, the verbal dentistry to which he is unwilling to submit the names of mining companies is not the only alternative to the use of objectionable titles. He must know well enough that there is no rule for such proper names, that the censor in this case is not a grammarian but Somerset House; and that as regards proper names, in general, a man may spell his name as he pleases and christen his children as he likes.

Mr. Sulman makes a plea for the adoption or coinage of useful words. It is true, we are a polyglot race and our language does reflect the migratory history of our people. Did I not expressly say that "a language grows by such accretions; it is thus that English has borrowed from every country with which our people have traded or fought." But it were better to borrow from the wily Chinaman or the gentle Hindu, introducing a mintage that is foreign but made of pure metal, than to adopt thoughtlessly the nickel pennies and solder coins of American slang and Australian colloquialism. The emphasis is on "thoughtlessly."

Mr. Gregory will forgive me if I deny the prefix of 'professor' to one who is so competent a teacher, for I hold that 'professor' is not titular, but descriptive. However, I agree with him as to spelling reform, in general, even if I did make a bid for the use of *z* instead of *s* in words signifying agency. As regards spelling, I hold that it is not for a self-constituted board at New York to impose wholesale reform on a language that is not solely the possession of the people of the United States. The English language is the common heritage of all the English-speaking nations, and any reform must be undertaken not from an American or a British, an Australian or an African, but an English point of view. That is why I am making a fight against terms that are purely American or purely British, and likely to be unknown or misunderstood outside the place of their origin. As to 'mullock' and Chaucer: 'Mullock' may be good Old English. So is *he wasa-doing of it* and *I guess*, "but in neither case can the appeal to a dead usage—dead in polite society or in England—justify what is a modern vulgarism." I quote from 'The King's English,' an erudite and entertaining authority. Mr. Gregory asks for an equivalent to 'mullock.' Why not 'waste'? 'Mullock' has no precise meaning and no geological significance. At Bendigo the 'mullock' is a mixture of slate and sandstone, at Broken Hill it is quartzite and schist. 'Refuse,' 'waste,' 'barren rock,' 'discard'—there are many words adequate to replace a term so loose.

'Mullock' is Old English. It is a provincial word and the diminutive of 'mull,' meaning to reduce to dust or powder. It means 'rubbish' or 'dirt.' When a man's efforts are worse than futile, he is said to make "a mull (that is, a mess) of it." Perhaps I offer an unconscious illustration. 'Muck,' as used in American mines, is almost synonymous with 'mullock.' These two words are interchangeable and equally objectionable, for the rock separated from the ore in a mine is not filthy, it is not rubbish, and there is no sense in labelling it so.

In regard to 'calcination' it will serve no useful purpose to base current usage on an intermediate phrase of a word that has departed from its original meaning. The root is 'calx,' which in Latin signified a pebble or small stone; we use the diminutive 'calculus' still in surgery and mathematics, the latter application being due to the use of pebbles in making calculations. Subsequently the word was used to denote lime, and this meaning was employed at the beginning of the last century to serve as a root for the word 'calcium,' the name given to the metal separated from lime. Thus 'calc-spar' and 'calcareous' are identified with lime. In the middle ages, the chemists applied the word 'calx' to an earthy product obtained by expelling water, carbonic acid, or other volatilizable compound from any mineral, vegetable, or animal substance by the aid of heat. They also used this term to denote the powdered product obtained by heating anhydrous silica. As Mr. Sulman says, the elimination of sulphur was included in 'calcination' by medieval chemists; but the historical aspect of the case is only serviceable in so far as it gives an intelligent and complete view of the etymology. My point is that the metallurgy of sulphide ores has assumed so great an importance that it is a matter of convenience and in the interest of precision to use a different term when referring to the expulsion of sulphur—and arsenic or antimony, of course. The chemical operation of expelling carbonic acid and water is essentially different from that of dissociating sulphur. In the former case the operation is effected by the application of outside heat, while in the latter, one of the constituents of the substance treated provides most of the heat required. For this reason, the two reactions deserve distinctive names. A metallurgist working on copper ores may not see any need to differentiate between the terms, as they convey exactly the same idea to him; but a zinc-smelter objects to this interchangeability, for his furnace-charge is composed of both 'calcined' and 'roasted' ores.

The Oxford English Dictionary appears to have been unknown to my critics, except Mr. Shockley, but as it is the ultimate (in more senses than one) authority in our language, I do not apologize for quoting it. Most dictionaries require years to compile, and I do not agree with Mr. Stables that even in twenty years does a good dictionary become worthless or "out of date." It is not the function of a dictionary to note the passing phases of linguistic development, but only to record the words that have, after probation, found a place in the language.

Of course, in speaking of 'combs' of gold-bearing quartz, the reference was not to hatchways or waves, but to the comb of a cock—surely an appropriate metaphor. Possibly Mr. Stables had a smile on his face when he made this criticism, as when he objected to my reference to the squandering of a useful inflection "like a sailor on the spree." As to sailors and their sprees, and whether they squander useless money or useful inflections, I do not know, save by hearsay.

A 'vein' typifies the tabular and persistent ore deposit, and there is no reason why it should convey the idea of conformity to the strata; there was nothing in what I said to warrant such an inference. 'Seam' is not a good term for a lode of metal-bearing ore, because it carries the idea of regularity, uniformity, and conformity to the stratification. I agree that c o a l s e a m is better than c o a l v e i n, for 'vein' suggests ramification and irregularity of structure. Thus it is appropriately applied to the persistent (or continuous) tabular (between walls) ore deposit, traversing the country rock in accordance with a system of fractures that may or may not coincide with the stratification, cleavage, jointing, or any subordinate manifestation of structure.

Mr. Stables has misunderstood the reference to the use of the word 'camp.' The objection is not to the usage when justified by an official christening, but to the undiscriminating employment of 'camp' in speaking of mining settlements. His analogies are far-fetched.

Mr. Stables ends his contribution to the discussion with a remark of which no notice might be taken if the absence of a rejoinder were not likely to be misconstrued. It is true that "the suggestions as to the uniformity of expression in technical writing would have met with greater approval had they emanated from the Council," but it happens that the Council was not unwilling that the good work should be undertaken by a member who "assumed the position of mentor in technical literature." That member hopes to be forgiven for "assuming" to write and speak on a subject to which he has devoted many years of his life, and he will not be deterred from fulfilling a useful task by supercilious critics.

As to 'mullock' and its Old English origin, I have answered that feeble argument already. If every term that has been "used by Cornishmen for over thirty years" is to be adopted by technical writers, I can promise the rest of the world a merry time. 'Laccolite' and 'tundra' may or may not, be in the "Century" dictionary; they are in the "Standard"; moreover, these terms are constantly used in the publications of the United States Geological Survey—an excellent authority. As to 'cement' and 'cementation,' I refer Mr. Stables to the "Standard" dictionary, which is later than the "Century."

Mr. Louis offers some pithy remarks, for which I thank him, even if he takes exception to my use of an occasional French or Latin phrase. I refer to Macaulay's retort to Napier.

Next I find that Mr. Shockley has taken up the challenge implied in my suggestions. Such criticism as he offers, uncompromising though it be, is indeed a compliment, for it furthers the purpose of the original paper. The aim of serious criticism is, I believe, to be penetrating but polite. Mr. Shockley has succeeded. As regards the use of *z* instead of *s* in words signifying agency, I take pleasure in quoting William Skeat: "The suffix *-ize* is both Greek and phonetic, and much to be preferred if we are to have uniformity. The suffix *-ise* is French."

Mr. Shockley objects to my use of 'solecism.' This word originally referred to the bad Greek spoken by the colonists of Soli in Asia Minor; it carried no reference to grammar. I believe my use of it is fully justified. As to 'supposititious' in the context criticized, Mr. Shockley and Mr. Pratt are both correct in their objections. It was a slip.

Whether ease of translation be a poper test of lucidity I am willing to leave to my readers. It seems so to me, having known two languages (now forgotten) before learning to speak English fluently. Mr. Shockley says that "if the hypothetical educated Frenchman could talk for five minutes with an American engineer, he would have no trouble in translating the sentence containing 'muck' and 'mucker.'" My hypothetical Frenchman lives in France and is not so fortunate as to be able to converse by wireless telegraphy with the writers of 'muck' in Nevada.

We are told that "the difficulty of translating does not depend so much on the purity of the English original as on the familiarity of the translator with his subject"; apparently the language of an English author, being rendered obscure by reason of local terms or queer idioms, is to be translated successfully by aid of the foreign translator's knowledge of the subject, this knowledge be-

ing sufficient to fill the occasional hiatus created by the unintelligible English of the original. This reminds me of a friend who is engaged in translating 'Agricola' and finds that the author used mining terms now so obsolete that only an occasional illuminating guess will suffice to make sense of the text. But this argument against the use of 'muck' and 'mullock' is not the only one; such localisms restrict the usefulness of technical literature by making it unintelligible to English-speaking persons not living in the region where such terms are rampant.

It is amusing to learn from Mr. Shockley that 'muck' is gaining ground in America; it has actually been adopted in Southern Nevada. When the New Zealander stands on London Bridge gazing at the ruins of St. Paul's Cathedral we shall go to Southern Nevada to learn how to speak English correctly, but not until then.

My critics can defend 'muck' and 'mucker,' 'paddock' and 'mullock,' as they please; they may quote Chaucer or Choctaw; but the fact remains that these words are not used by men of culture anywhere, save as concessions to local slang, and the usage will die out because it is taboo among thoughtful technical writers and editors both in England and America.

Mr. Shockley has more to say concerning the translating of unfamiliar words; he says that the difficulty of translating "I am going home" into French is due "simply to the difference in idiom." He is mistaken; the difficulty is due mainly to the fact that the French language contains no word for 'home.'

As to 'partial' and 'partially,' I refer Messrs. Shockley and Allen to 'The King's English,' in which instructive volume they will find it stated on page 45, that "p a r t i a l l y, which should be reserved as far as possible for the meaning 'with partiality,' is now commonly used for p a r t l y." Again: "The rule should be never to write p a r t i a l l y without first considering the claims of p a r t l y." Where we have two words for two meanings, it is well to devote one word to one meaning, as nearly as we can. I do indeed "wish to avoid all ambiguous words," and in editing manuscript, whether my own or that of others, I delete words of doubtful meaning whenever practicable, choosing those that leave no room for misunderstanding. It happens that I have often noticed the confusion created by the undiscriminating use of 'partial' and 'partially,' when meaning 'in part' and 'partly.' Hence my mention of the matter.

Yes, Mr. Shockley is right in saying that "the ore shows free gold" is not the same as "the ore contains free gold." I accept the correction; the point, however, was not there, but on the use of 'at times,' when 'in places' is meant. His explanation is ingenious, but not convincing. Even if the progress of work underground be measured by the passage of time, the existence of free gold in the ore is not affected by the calendar. Of course, the man who wrote "at times" may mean that on Monday he saw free gold in the ore and on Tuesday he did not; but, in the absence of an interview (which Mr. Shockley may suppose to take place between author and reader, as between writer and translator), I surmise that he meant that gold was seen in the ore at a given place and was not visible when the drift or working had been advanced a few feet farther.

Next we come to 'preposition-verbs.' Mr. Shockley and Mr. Allen both object to my use of the term. One of them suggests 'compound' and both lay stress on the fact that some of the prepositions are used adverbially. Both, however, show that they understand what I mean and neither of them has suggested a better term. 'Compound' will not do; 'preposition-verb' suffices to indicate a verb to which a preposition is tied.

Of course, I use verbs followed by prepositions, as Mr. Shockley says, but my objection was to the unnecessary use of prepositions as part of a verb when single words of more expressive character are available. Mr. Shockley is in error in judging that I do not mean what I say; he will be correct if he states that I sometimes do not say what I mean. After all, language is an imperfect implement, like those tools "ill-adapted to the purpose" with which a golfer harries a little white ball into a small hole.

Both Messrs. Allen and Shockley have detected the error of omitting *on* after 'depend'; I stand corrected, and invite them to accept the alternative 'trusted' instead of 'depended on.' Whether a man who can and is 'depended on' is and can be 'trusted,' I leave to my readers. If Mr. Shockley prefers that "the proceedings" shall "end up with a dinner" instead of "end with a dinner," he is welcome. To me the former suggests nausea.

To Mr. Shockley my objection to preposition-verbs is a "mystery." Let me state frankly that I have found, by personal experience and by editing much manuscript from others, that the use of verbs of this kind tends to clumsy construction and to lack of precision. For one preposition-verb that serves a useful purposes there are half a dozen that are awkward excrescences. Moreover, daily work as an editor has given me sufficient warrant for saying that the tendency is peculiarly British. An American who had been to a rich mine would not say it was the finest mine he had *met with* in his travels"; an Englishman would say so, but an American would say that it was "the finest he had *seen*." If *ended up with* be "a most valuable mode of expressing a shade of meaning," Mr. Shockley is welcome to it. In this and in one or two other minor matters I do not follow him nor is it necessary for me to reply. As to the Bible, if technical writing is to be modelled on that venerable and beautiful relic of old-fashioned English, we shall see strange phraseology. The Bible is inspired poetry, not technical science. Similarly it is beside the point to quote Shakespeare in this connection. We are discussing technical writing, not blank verse. I refer Mr. Shockley to Huxley, Geikie, and Raymond, if he is in search of models of scientific or technical expression.

Mr. Robert Allen also has made some effective criticisms and I appreciate the reasonable tone of most of them. He begins by demurring to my use of 'British.' The English-speaking races use the same language, but with local variations; the variety in vogue in the British dominions is 'British,' as distinguished from the dialect peculiar to Americans. As a sub-dialect of the British I referred to 'Australian' and 'South African.' 'Reef' originally was Australian, it is now British, having been adopted in London and at Johannesburg, but it is not English, because it does not pass current in America. 'Continuous' is no improvement on 'persistent,' although 'persistent' is obviously preferable to 'permanent,' as applied to an ore body.

What carelessness will do to technical writing is exemplified by the title of a recent article in *The Mining World*, of Chicago: 'The Perpetuity of Vein Mines referring to the longevity of mining enterprises or the persistence of veins in depth.' In describing 'field' as "a verbal iniquity" when applied to a mining district, I did not condemn the use of it in a metaphorical and familiar sense, as in "the field of wet metallurgy." Mr. Allen's question is trivial.

As to 'scrapped,' I refer Mr. Allen to the issue of *The Spectator*, published on July 9th, 1910, where he will find a reference to the proposal "to *scrap* the existing Parliament." Co-eval' may be written with or without

a hyphen; on further consideration, I agree with Mr. Allen that the hyphen may be omitted without error, although I like to separate vowels in words beginning with *co-*, and *re-*, as 'co-operate' and 're-invest.'

Mr. Allen's criticism on the use of 'partial' and 'partially' has been anticipated in my reply to Mr. Shockley. I appreciate his humour.

His defence of the preposition-verb is laboured. The quotation from the *Westminster Gazette* does *not* contain a misprint, but a blunder frequently made by those that bespatter their writing with preposition-verbs. Mr. Allen insists that *met with* is "undoubtedly correct" in the sentence "The richest mine I *met with* in my travels." Did the mine come forth to meet him or did he hasten with outstretched hands to meet the mine? It is absurd to defend so feeble a colloquialism. As to whether 'devise' conveys the meaning of 'work-out,' I am prepared to say, as I wrote the sentence quoted.

Mr. Shockley exercises his imagination recklessly in depicting the man who is doing all kinds of things to ascertain what process to adopt. Mr. Allen suggests that 'devise' is to sit in a chair (the "editorial" is scarcely funny) and "*draw up*" a scheme. The fact is the consulting engineer asked one or two friends to dine with him, and when the dinner was satisfactorily concluded, they lit their cigars and discussed the question of metallurgical treatment, roughly sketching a flow-sheet. Thus they 'devised it.' 'Work out' possesses no advantage over 'devise.' We 'work out' the ore in a mine; to 'work out' is to work exhaustively, if it means anything in particular.

Incidentally, both Messrs. Allen and Shockley failed to note that the 'out' in *work out* is an adverb, for it qualifies the verb. It is a preposition used adverbially. The remark that 'away' in *done-away with* is an adverb is hypercritical, for 'with' is a preposition, and my objection is to the adverb-preposition-verb as a whole.

If 'maintain' be not a substitute for 'keep up,' then 'upkeep' is not a synonym for 'maintenance,' as I hold it to be. We use 'maintenance' in a technical sense, on railways, for example, and it is an excellent term, easily understood. 'Upkeep' would puzzle an American and confuse a foreigner.

If Mr. Allen likes to have his ore 'wetted down,' he probably would enjoy the language of a cockney waitress who asked me whether I wanted my soup "hotted up." The surface of ore when 'wetted' is not always "lowered," for the addition of moisture may set in motion chemical processes inducing a swelling of the mass. The reference is usually to preventing the dust from rising.

The criticism of 'intersect' is fanciful. If Wellington Street and Strand 'intersect' each other with propriety why should not a cross-cut and a vein do so without apology? Two lines cross each other, in one case the line of two streets, in the other case the line of an opening made by man and an older opening made by Nature.

Mr. Allen's further remarks on preposition-verbs do not require reply. I leave it to him and to others to use them, if they prefer, but I am confident that this discussion will open their eyes to the clumsy construction resulting from such usage.

I appreciate Mr. Allen's approval of my remarks on the excessive use of the indefinite pronoun. Apparently nobody cares to defend the abuse. Of course, it is absurd to quote Byron and Shakespeare; we are discussing prose in the first place, the prose of to-day, and technical prose in particular. I would paraphrase Lord Rosebery's remark thus: "The less I say about a subject concerning which I know nothing, the better it will be for you and for me." The remark, needless to say, has nothing to do with this discussion; we must not confuse a coincidence with a consequence. Of course, Lord Rosebery might not accept my version of his statement as a faithful expression of his meaning, any more than I accept Mr. Allen's paraphrase of my remarks. He omits the 'you' and 'your,' but forgets that my statement, such as it is, was supposed to be addressed to a meeting of members of the Institution.

Mr. Richardson's contribution to the discussion is useful, although I demur to some of his arguments. Even if our language be "the product of evolution," we need not be deterred from an effort to influence its development at a few points, as at that particular point where it becomes the medium of technical information. In any event, I am unwilling to wait until the language is "dead." Again, if the best of dictionaries be (to Mr. Richardson) an insufficient authority, I marvel that he should be willing to bow to the "sanction of government and finance," as expressed presumably by politicians and promoters. When the directors of Rand companies and Government officials in Australia become authorities on Spelling then we shall go to Southern Nevada to learn English—a procedure that will, at least, have the merit of pleasing Messrs. Richardson and Shockley.

Mr. Richardson's interpretations of 'profitable' and 'payable' call for no special comment; obviously a mine cannot be 'profitable' unless it is productive. 'Payable' does not mean what Mr. Richardson says it means, and only confusion can result from defining one doubtful word in terms of another doubtful word.

This ends my reply. I note with pleasure that nobody has defended the unnecessary plural nor the excessive use of the indefinite pronoun. The discussion has served its purpose, in calling attention to careless writing and the thoughtless use of local terms. Whether those who read my paper agree with all of my suggestions, or not, is unimportant; my aim has been fulfilled, for a few of my countrymen, members of the profession to whose service the Institution is dedicated, have been compelled to "sit up and take notice" of a feature of their work usually disregarded.

Henceforth when a mining engineer takes his pen, whether an eagle's plume or a goose's quill, he will recollect the fuss made by a member of this Institution and he will hesitate, not long enough to be self-conscious but at least long enough to use words thoughtfully. I refuse to believe that the attention drawn to the technicalities of writing will deter men from contributing to technical literature; on the contrary, I hope that the interest of the subject will lead them to use the implement of written speech whenever they have something worthy of record.

THE PREVENTION OF MINE EXPLOSIONS.

[Editor's Note.—In view of the step taken by the Dominion Government in securing the temporary services and advice of Captain Arthur Desborough, H. M. Inspector of Explosives, part of the report issued by the United States Geological Survey, two years ago, is herewith reprinted. This report embodies the recommendations of Capt. Desborough and two other experts.]

RECOMMENDATIONS.

A.—Selecting the Explosives to be Used.

(1) We recommend that the Government of the United States examine the explosives now and hereafter used in mining, with a view to eliminating the more dangerous explosives and to improving and standardizing such explosives as may be considered most suitable for such use, these to be designated by the government 'permissible explosives.'

The term 'permissible explosives' is suggested for the reason that no explosives are entirely safe, and all of them develop flame when ignited; and we advise therefore against the use in the United States of the terms 'safety explosives' or 'flameless explosives,' as these terms may be misunderstood and this misunderstanding may endanger life.

(2) We recommend that the operators and miners of coal use only such explosives as are included in a list of 'permissible explosives,' when the same has been published by the Government, in all mines where there is risk of igniting either dust or gas, selecting that one which their own experience indicates can be used to the best advantage under local conditions.

(3) We also recommend that investigations be conducted to determine the amount of charge of such 'permissible explosives' which may be used to the best advantage under different conditions with a view to reducing danger to the minimum.

B.—Carrying the Explosives into the Mines.

(1) All explosives should be made into cartridges and placed in closed receptacles before being carried into the mine, and the quantity carried into the mine during one day by any miner should be limited as nearly as practicable to the quantity needed by him for use during that day. Handling loose explosives and making them into cartridges by an open light in the mine should be prevented.

(2) Detonators or caps should be handled with great care, and should be carried only by a limited number of responsible persons.

C.—Use of Explosives in the Mine.

(1) Shooting in or off the solid should not be practiced.

(2) The depth of the shot hole should be less by at least 6 inches than the depth of the cutting or mining. The use of very deep shot holes should be avoided as unnecessarily dangerous.

(3) The overcharging of shots (the use of a larger charge than is required to do the work satisfactorily) should also be avoided as unnecessary and dangerous. The proper standardization of explosives used in coal mining will greatly facilitate the carrying out of this recommendation. (See also 'A' 1.)

(4) Shots should never be tamped with fine coal or material containing coal. Clay or other suitable material should be supplied and used for this purpose.

(5) The firing of two or more shots in one working place, except simultaneously by electricity, should not be allowed until a sufficient interval has elapsed between the firings to permit an examination of the working place, in order to see whether any cause of danger has arisen.

(6) Before a shot is fired the fine coal should be removed from the working place, as far as practicable, and the coal dust on the floor, sides, and roof, for a distance of at least 20 yards from the place where the shot is to be fired, should be thoroughly wet, unless it has been demonstrated that the dust in the mine is not inflammable. (See also 'E' 1.)

(7) If gas is known to occur in the mine, no shot should be fired until, in addition to the watering, an examination made immediately preceding the time for firing, by a competent person, using a lamp which will easily detect 2 per cent. of gas, has shown the absence of that amount of gas from all spaces within 20 yards of the point where the shot is to be fired.

(8) Believing that such will be one of the greatest advances which can be made in safeguarding the lives of the miners, we recommend the adoption of a system of electric shot firing, in all mines where practicable, by which all shots in the mine, or in each ventilation district of the mine, may be fired simultaneously, at a time when all miners and other employees are out of the mine.

D.—Keeping the Mine Roadways Clean.

(1) The roadways of the mines should be kept as free as possible from loose coal which may be ground into dust, and of rubbish in which such dust may accumulate, in order to facilitate the removal and wetting of the dust.

E.—Wetting the Coal Dust.

(1) In all coal mines where explosives are used it is desirable, and in all mines containing gas it is highly important, that the dust on the walls, timbers and floors of the working places and roadways should be kept continually wet prior to and during the work in the mine. If, however, conditions of roof or lack of water render this general watering impracticable, at least the dust within twenty yards of each shot should be wet before each firing, and other precautions against explosions should be practised with unusual care.

It is our opinion that a system of watering which occasionally sprinkles the floor only and leaves dry the dust on the walls and timbers of the roadways is useless, and is also dangerous, in that it may generate an unwarranted feeling of security against an explosion.

F.—Special Precautions for Mines Containing Gas.

(1) In any mine where as much as 2 per cent. of gas can be detected by suitable method, only locked safety lamps of an approved type should be used so long as such condition exists or is likely to recur.

All safety lamps should be maintained in good condition, cleaned, filled, kept in a special room at the surface, and carefully examined both when delivered to the miner and when returned by him at the close of each day's work. A defective safety lamp is especially dangerous because of the false feeling of security it engenders.

In the filling of lamps with benzine or other low-flash oils, which should always be done at the surface, special precautions against fire or explosions should be taken.

G.—Use of Electricity.

(1) Electricity in mining operations offers so many advantages, and has been so generally adopted, that no reasonable objection can be made to its use under proper restrictions. The electrical equipment, however, should be installed, maintained, and operated with great care, and so safeguarded as to minimize danger from fire or shock. The fact that the effectiveness of some insulating materials is soon destroyed in most mines should not be lost sight of.

We recommend the following precautions: For distribution underground the voltage should not exceed 650 direct current or 500 alternating current, these voltages being intended for transmission to machinery operating at 500 volts direct current and 440 volts alternating current, respectively. Even lower voltages are preferable. The trolley wires should be installed in such manner as to render shocks least likely; that is, placed either high enough to be beyond easy reach or at one side of the track and properly protected.

(To be continued.)

PERSONAL AND GENERAL.

Mr. Martin Nordegg has returned to Toronto from the West.

Mr. Lewis Hind, of Victoria, B.C., has gone to Mexico on mining business.

Mr. J. C. Murray has returned from a visit to several mining districts in Nova Scotia.

Major Leckie went to Portland Canal, B.C., last month, to investigate conditions on some mineral claims there in which he is interested.

Mr. J. B. Turney, Fernie, B.C., for nine years purchasing agent for the Crow's Nest Pass Coal Mining Company, has resigned that position.

Mr. Charles S. Herzig, president of the Constant-Herzig Company, New York, has been appointed consulting engineer of the Jumbo Extension Mining Company.

Mr. John Hopp, of Barkerville, Cariboo, B.C., is at Harrison Hot Springs, recuperating after ptomaine poisoning, which a few weeks ago incapacitated him for work.

Mr. J. W. Astley has resigned his position as consulting engineer to the Peterson Lake Silver Cobalt Mining Company. At present he is paying a professional visit to Porcupine.

Mr. W. Yolen Williams, of Spokane, Washington, who for years directed the development of the Granby mines at Phoenix, B.C., has been examining the Cliff mine at Rossland. It is stated that Granby people are interested in its proposed purchase and operation.

A party consisting of Mr. Ambrose Monell, Capt. De Lamar, Mr. C. L. Dennison, and Capt. Lawson, recently visited Porcupine. There they examined the Dome mines in which they are largely interested. Mr. Tom Jones, manager of the Buffalo mine, joined them at Cobalt.

Mr. Herbert Carmichael, assistant provincial mineralogist, British Columbia, has been on an official visit to the Engineer mine, Atlin mining division, lately reported to have made unusually rich recoveries from small quantities of gold ore. His report to the Minister of Mines will shortly be printed.

SPECIAL CORRESPONDENCE

ONTARIO.

Cobalt.—Recent developments on the Crown Reserve have been very encouraging, and the work accomplished on two veins in particular has largely augmented the ore reserves. On the new vein found about 900 feet down the lake a raise has been put up for a distance of forty-five feet, and for this distance the vein was of good width and carried high-grade ore. Drifts on this vein are being run at the 200-foot level and there the ore is also showing up well. When the drift on the Victoria vein was in one hundred feet the values gave out, and it was believed that the end of the ore-shoot had been reached. The working was, however, carried on a short distance farther, and the high values returned. It has now been pushed some distance past this point, and the face of the drift is still in good ore.

At the drilling contest held in Cobalt recently, the Gowganda team raised the record for local miners by drilling 39¼ inches.

The McKinley-Darragh has declared the regular quarterly dividend of three per cent. with a two per cent. bonus. The works close September 10th and the cheques will be sent out on October 1st. When this is paid the company will have disbursed to the shareholders a total of thirty-six per cent. The property as a whole is in splendid shape and the Savage in particular is making great advances. The small concentrating plant is treating between thirty and forty tons of ore per day and is making good extraction. Some of the veins have also been cut on the lower level, and they are showing up extremely well.

The mill report of the Buffalo mine for the month of July shows that 3,398 tons of ore, averaging 33.75 ounces, were treated and that 88.078 ounces of silver were recovered.

The report is as follows:

Mill ran 597 hours.

Ore milled, 3,398 tons.

Average assay per ton, 33.75 ounces.

Milling Expenses—

Labour	$3,262.31
Power	682.78

On Lot A14 in the Gillies Limit a large gang of men have been at work all summer running trenches. Several promising veins have been uncovered and the owners have decided to install a small plant and sink on one of the best of these. A syndicate with a capital of $600,000 has been organized to work lots 85 and 88.

Figures for the first six months of the present year show that Cobalt and the surrounding districts have produced more than a million and a half ounces of silver in excess of the corresponding period for last year.

The production is as follows:

	Ounces.	Value.
1910	12,804,992	$6,260,197
1909	11,234,382	5,379,980
Increase	1,570,610	$ 880,217

This increase is largely due to the greater amount of concentrates now being produced. The proportion of ore and concentrates shipped is as follows:

	Tons.	Ounces per ton.
Ore	12,024	814
Concentrates	2,763	1,017

As there appears to be no probability of a decrease in the rate of production the total output for the year will probably exceed 26,000,000 ounces. This amounts to practically one-eighth of the world's total production of silver.

Since the City of Cobalt started concentrating their ore at the Muggley mill, they have again become fairly regular shippers. Approximately forty-two tons a day are being treated, that will average about thirty ounces to the ton. Development work under ground is proceeding on all the levels, and two veins are being drifted on. These are narrow but carry high-grade ore.

A new gold field is reported to have been discovered in Western Quebec near the Ontario border. The majority of the finds have been made in Privas Township, and fairly high assays have been obtained. The Grand Trunk Pacific will pass within a short distance of this section.

A compressor plant is to be installed on the O'Connor property which adjoins the Last Chance, near Latchford. A shaft has been sunk about sixty feet and the vein in the bottom shows considerable niccolite and some silver.

It is stated that Mackenzie and Mann have taken up a working option on 4,000 acres of iron lands near Grand Rapids, on the Mattagami River. Five diamond drills and a considerable force of men will be sent in to prove up the deposits. The options cover the Powell, Glidden, Shields and La Duke properties, which are believed to be among the best up there. The entrance of this firm into the Mattagami district is of great importance and if they take up their options, there will be plenty of capital with which to work them. Senator Flynn, of Pittsburgh, also has control of a considerable acreage, and he will send in a diamond drill.

Reports have lately been circulated regarding the position of the Kerr Lake and the possibility of the directors reducing the rate for the next dividend. On account of the large shipments of low-grade ore the reserves in the mine were reported lower than was generally supposed. In this connection it is interesting to note that the management state that the big ore shoots above the 150-foot level have not been drawn on. The rich ore being shipped comes from the 190-foot level and the new vein discovered some time ago. The low-grade shipments are drawn from an accumulation of about 1,500 tons of screenings assaying from 100 to 300 ounces per ton. The mine is keeping up a production of about 200,000 ounces a month from which the profit is approximately $80,000.

On August 29th the T. & H. B. Company paid another dividend of 300 per cent., which is equivalent to $23,263. This last dividend makes a total of 16,900 per cent. on an issued capital of $7,761. Good progress is being made with the new concentrator, which the company expects to have completed about January.

An accident that might very well have ended disastrously occurred recently in the T. & N. O. yards in Cobalt, in front of the new station. The bank at this point gave way and slid into Cobalt Lake, carrying with it several freight cars. A large part of this ground has been made by filling in along the edge of the lake, and the heavy weight of the trains loosened it so that it finally gave way.

The old Green Meehan mine has been leased to Mr. E. C. Kingswell, of Ottawa, and associates. By the terms of the agreement the property is leased for five years and the new owners must spend $30,000 the first twelve months. This property was one of the best known in Cobalt in the early days and shipped a considerable quantity of high-grade ore. No work has been done on it for some time.

A few days ago a large nugget weighing approximately 1,200 pounds, of very high-grade ore, was taken from the winze on vein No. 4 below the 400-foot level of the Temiskaming. This vein has been producing a large amount of very spectacular ore, and is one of the best in the mine. The main shaft has been sunk to a depth of 500 feet, and at this point a crosscut is being run to cut the vein, which it is estimated, is about 60 feet distant. Heavy shipments are being made from the property and the financial position has greatly improved the last six months.

The pressure of the hydraulic air has again practically reached the point at which it stood when the company first commenced operating and the management expects no further difficulties. The trouble arose over the mines using a great deal more air than they had contracted for.

A new discovery has been made at a depth of 286 feet in the shaft of the Ophir property. Where intercepted the vein showed about ten inches of calcite carrying some silver values.

At the Beaver two good finds have lately been made. The first was in the back of the stope on the 200-foot level where the values were supposed to have given out. The first round opened up a rich ore shoot. Some time ago a crosscut was started from the 300-foot level to cut this same vein. In the face of the working it shows about three inches of high-grade ore.

There is at the present time considerable activity in the Matachewan district and quite a number of prospectors are in there staking claims. The district is being widely talked up with a view, it is believed, of creating a boom there this winter. Some very good discoveries have been made, but not enough to create any excitement.

The Nova Scotia has stopped work on the Peterson Lake lease on account of the reopening of the litigation between these two companies. Good results are being obtained by the mill, but no records are as yet available as to the extraction and costs of operation.

The road from Silver Centre to the Keeley mine in South Lorrain has recently been completed, and the Wettlaufer is now shipping ore. Several cars are already bagged and in the ore house, but the roads were formerly so poor that it was practically impossible to make shipments. The Mines Power Company is rapidly completing the construction of the sub-station at Beaver Lake and power will then be ready in a short time. The Wettlaufer has a twelve-drill power-driven compressor already set up, and when power is obtained the work at the mine will be carried on on a much larger scale. The Haileybury Frontier also has a new compressor installed, and has erected a number of new buildings. The shaft has been sunk to 150 feet and a crosscut is being run to open up the vein that showed on the 65-foot level. Trenching on the Harris Lorrain, Alice Lorrain and Marathon properties has been productive of encouraging results. On the former a vein was picked up near the Wettlaufer boundary that carries smaltite with some silver. It has been decided to sink a 100-foot shaft on it. A new vein was also discovered recently on the Alice Lorrain and this will be developed immediately.

Gowganda.—It is reported that the control of the Boyd Gordon has passed into the hands of Buffalo people. Under the new management more extensive development will be undertaken.

Good ore is being obtained on the O'Gorman and Sweet claim near Hangingstone Lake. The shaft is down sixty feet, all in ore, and the vein, although narrow, is very high grade.

The latest discovery in the Elk Lake section is a vein of galena found near Thin Lake. The vein is from four to five feet in width and some exceedingly fine ore has been uncovered.

Samples from the different properties in Elk Lake and Gowganda have been sent to the Department of Mines. They will be displayed in the mineral exhibit at the Dominion Exhibition at Toronto.

It is reported that the Ottawa Gowganda Company, operating near Lost Lake has made a good surface discovery.

Some fairly good discoveries have lately been made on properties near Elk Lake. A small vein carrying considerable silver was found on the Ribble-Emery. No sinking has been done as yet, but a shaft will shortly be started. A rich surface discovery has also been made on a claim owned by Messrs. Otisse and Currie near Hubert Lake. Work on the Montreal James has been stopped. This is one of the Julian Hawthorne properties.

A four-inch vein of calcite carrying good values in native silver has been found on the Crawford claims in Gowganda. This property adjoins the Reeves Dobie.

Porcupine.—A half interest in the Sandy Falls power has been purchased by the Timmins McMartin syndicate. The power plant will be only a few miles from the mine and this property will undoubtedly be one of the heaviest users. The preliminary surveys will soon be completed. The small stamp-mill on the Timmins property is producing good results, and recently two tons of ore were treated that produced over $200 per ton.

The stockholders of the Porcupine Gold Mines Company have authorized the installation of a stamp-mill. The company's engineer states that there are ten tons of ore on hand worth $1,000 a ton.

On the Hylands property some free gold has been found, although but little work has so far been done. The owners have decided to put in a small mill with two stamps, as soon as the winter roads are in condition.

For the purpose of centralizing their efforts in looking after the best interests of the district, the mining men in the camp have formed a mine owners' association. The association already has members from many of the most important properties and has elected its officers. The power and transportation questions are those that will probably first engage its attention.

BRITISH COLUMBIA.

Cariboo.—Information received from Cariboo is to the effect that the long-continued dry weather is making the gravel-washing season a short one. Unless copious rain shall fall in the early part of the autumn, the yield of gold from the placer mines may be expected to be short of the quantity regarded as an average of production in recent years. On some placer mines there has been a "clean-up," and a resumption of operations this season will only be practicable if the water supply shall be renewed.

Additions to ditches and flumes, and the provision of more storage reservoirs, etc., is being continued on some of the properties near Barkerville, owned by Mr. John Hopp. Here, as elsewhere, shortness of water will curtail the washing season this year; thus far, however, results have been fairly satisfactory, the amount of gold recovered having been fully up to the average of seasons in which water was not plentiful. Operations on this group of mines are on a larger scale than on any other in Cariboo district.

Lillooet.—Placer mining is carried on along several streams, including both north and south forks of Bridge River and Tributary creeks—Alexander, Sucker and Cadwallader Creeks, and on Cayoosh Creek. There are quartz properties, too, some of which are being operated. Last year's official returns accounted for a recovery of between $6,000 and $7,000 in gold, and this year an encouraging increase in production is looked for. At the Ben d'Or mine there is a 10-stamp mill; at the Lorne there is an arrastra, and others at the Pioneer and Woodchuck. There is also a 10-stamp mill in connection with the Anderson Lake M. & M. Company's property on Gold Creek, a tributary of McGillivray Creek. The Wayside group, on Bridge River, is being developed by a Cincinnati syndicate. Facilities for transportation are generally lacking in the parts of the district where promising mineral claims have been prospected, but it is hoped this difficulty will be overcome in the near future. The provincial mineralogist, Mr. Wm. Fleet Robertson, is in the district, making an official investigation of mining progress and conditions, and the publication of his report should assist in drawing the attention of men with capital to the good prospects for profitable mining here.

East Kootenay.—Apart from operations at the St. Eugene and Sullivan lead mines, both being operated by the Consolidated Mining & Smelting Company, several mines are being developed. It is planned to erect a concentrating plant for the Aurora, situated across Moyie Lake from the St. Eugene, where a large quantity of ore has been opened by prospect workings. The Society Girl, situated about 2,000 feet higher than Moyie Lake, and distant two miles southeast of the St. Eugene mine, has had two adits driven, and during the summer wagon-road construction work was done, so that ore might be hauled to the railway for shipment. Other claims near Moyie Lake are reported to have good showings of ore, but these have not yet been considerably developed.

Placer mining is being done on Wild Horse Creek, Bull River, Perry Creek, and other streams. Of these that on Perry Creek appears to be the most important, for there a steam shovel handles the gravel and about 20 men are employed.

Coal mining in southeast Kootenay shows increased production. The output of the Crow's Nest Pass Coal Company's mines has been up to 5,500 tons on one day; the company's payroll for July required a disbursement of $193,856. The Hosmer Mines, Limited, is producing 700 tons a day, of which half is made into coke.

West Kootenay.—Two mines in Ainsworth division are resuming operations, namely, the Highland, near the town of Ainsworth, and the Blue Bell, across Kootenay Lake from that place. The company working the former late last year and in the beginning of this year, got behind in its payments so had to stop work. A new company, organized recently in Vancouver, put men to work in August; its advertising methods and expenses have been such as are unusual in connection with really good mining enterprises, yet since the mine was, some years ago, a profitable producer it would scarcely be fair to condemn it until it shall have been given a fair chance to again prove itself of commercial value. The Blue Bell, on the other hand, is being financed by French capitalists, who are stated to be providing the additional capital requisite for obtaining hoisting and pumping machinery, and making additions to concentrating mill equipment. Last year's output from this mine was approximately 60,000 tons of ore, yielding about 70,000 ounces silver and 6,500,000 pounds lead, beside much zinc concentrates put aside for marketing when conditions shall be favourable for making a profit out of it.

Slocan mines continue to make progress, with some of them shipping ore. The latter include the Ruth and Richmond-Eureka, near Sandon, and the Van Roi, Standard, Mollie Hughes and Eastmont, near Slocan Lake. Of the latter the Van Roi's production figures of ore concentrated are large, while the others have shipped crude silver-lead ore—the Standard about 900 tons, the Eastmont 600 tons, and the Mollie Hughes 300 tons. In Eastern Slocan, wagon-road communication to the Lucky Jim and Rambler-Cariboo mines has been provided and materials are being taken in to replace mine buildings, tramways, ore-bins, etc., destroyed by the forest fires of July. Both mines will again be shipping ore before the close of the autumn. At the Whitewater, too, matters are being shaped for an early resumption of mining, wagon-road connection being provided to give an outlet to the Kaslo & Slocan Railway at Sproules, 14 miles from Kaslo.

Activity prevails in parts of Nelson mining division. Near Nelson, at the Granite-Poorman and Athabasca gold mines, particularly, conditions are satisfactory. Road-makers are making provision for hauling from the Mollie Gibson, on Kokanee Creek, to Kootenay Lake; in the opposite direction from Nelson the Queen Victoria mine is shipping copper ore to Trail, shipments ranging from 200 to 400 tons per week. At Ymir, the Yankee Girl is most active, its shipments to Trail having reached a total for the year to the end of August of 3,700 tons of ore. Last year's production was about 3,200 tons, which averaged 1.4 ounces gold and 7 ounces silver per ton, and 6 per cent. lead. Work has been resumed at the Wilcox mine, after several years' idleness; this is a gold mine, having its own stamp mill, situated in the neighbourhood of the one-time productive big gold mine, the Ymir. In Sheep Creek camp, the Queen, Nugget, and Mother Lode are the leading mines; the last-mentioned is not now producing, but its development is on a larger scale than in any other mine in the camp. Other claims in this and the neighbouring Bayonne district are being given much newspaper publicity, but as yet they are generally non-producers. The Emerald mine, near Salmo, has this year shipped about 1,200 tons of lead-silver ore, while the Second Relief, at Erie, makes an occasional small shipment to Trail, whether of concentrate or gold quartz is not stated.

Rossland mines shipping ore are the Centre Star-War Eagle group, Le Roi, Le Roi No. 2, and Velvet. The total of the Centre Star to the end of August is approximately 128,000 tons; Le Roi No. 2 has shipped 22,000 tons, a small part being concentrate from some 10,000 tons of low-grade ore put through its concentrating plant. Le Roi is still sending from 200 to 300 tons of ore to Trail each week; the Nelson Daily News gives its total to end of August as nearly 10,400 tons, while the Rossland Miner states it at about 7,300.

The northern part of West Kootenay is not doing much productive mining at present, the only mine shown as shipping steadily being the Silver Cup, in the Lardeau, owned by the Ferguson Mines, Limited. Several other properties in that district are also being worked, but are not shipping much ore. Placer mining is still being done in the Big Bend district, Columbia River.

Boundary.—With the exception of a reduction in output at the Granby Company's mines, following the recent destruction by fire of one of its four shipping units, there is little change

to note at Boundary district mines. Granby tonnage is now equal to the requirements of four of its blast furnaces, instead of six as was the case prior to the occurrence of the fire. Renewals are being made at the mine, so production will probably be normal before the close of autumn. The several mines of the British Columbia Copper Company continue to ship to their smeltery an aggregate of between 8,000 and 9,000 tons per week. The Snowshoe's output is from 1,600 to 2,000 tons of gold-copper ore, shipped weekly to the Consolidated Company's works at Trail. A resumption of work at the Fontenoy and Waterloo gold-quartz properties in Camp McKinney, has been announced.

Similkameen.—An endeavour has been made to draw the attention of mining men to the good field the lower Similkameen district especially offers for the outlay of money in developing mineral claims. The comparatively large profits the Hedley Gold Mining Company is making—the report for the quarter ended June 30th having shown, as published, a net profit of $99,154, equal to three times present dividend requirements, which are three per cent. quarterly, are pointed to as indicative of the possibilities of mining in this district.

Kamloops.—The Standard states that 25 men are employed straightening and retimbering the shaft of the Iron Mask mine, near Kamloops, and that when this work shall be completed mining will be resumed with a larger number of men engaged in the mine. The shaft is 600 feet in depth; much drifting and stoping was done in the years 1904, 1905 and 1906, and about 25,000 tons of ore was taken out.

Coast.—Experiments with oil as fuel in copper smelting have been made recently at the old smeltery at Van Anda, Texada Island, under the supervision of Mr. Thomas Kiddie. Results were sufficiently satisfactory to warrant a continuance of operations. It is yet early, though, to assume that it will be practicable to smelt ore on a commercial scale with oil as fuel, but there seems to be a reasonable chance of success being achieved. The Marble Bay mine is closed temporarily, so far as ore production and further development are concerned. Repairs are being made to the main shaft, and the mine workings are being wired for lighting by electricity. A comparatively large quantity of copper ore (bornite), also containing good value in gold and silver, has been shipped to the smeltery at Tacoma, Washington. Work is in progress at both the Copper Queen and Cornell mines, also on Texada Island, and near the Marble Bay mine. During recent weeks some high-grade ore, running in value to more than $100 per ton in gold, silver, and copper, has been shipped from the Cornell.

Forest fires have destroyed the shafthouse, bunkhouses and other surface property of the Canadian-American Exploration Company on Valdes Island, but the machinery and plant were saved, the miners piling sacks of ore over them when the fire was approaching the houses. At the neighbouring Jucky Jim mine the buildings were saved owing to there being fire hose and a good supply of water available. A logging tramway, which gave connection with tide-water three miles distant, was also destroyed in places.

Portland Canal camps are still drawing attention, but published statements are now not nearly so sensational as earlier. Reports are to the effect that on five or six properties development work of some importance is being done, while the Portland Canal Mining Company is hastening the completion of the first unit of its concentrating plant so as to give its ore a bulk test as soon as it shall be practicable to do so—probably during September. There is no doubt as to the bona fides of this company, for it has done more development work than others, has constructed an aerial tramway 8,500 feet from mine to mill site, and has erected and equipped a concentrator; besides, it has put in an air compressor. Many prospectors attracted to Stewart by glowing reports, have gone to Goose Bay and other parts of Observatory Inlet, an arm of Portland Canal. Good reports come from Hazelton, Skeena River, of finds of galena ore in the country around that town. Specimens of ores are promising and outcrops indicate occurrence of ore bodies, but not much development has yet been done. Assurances from responsible men encourage the expectation of important developments resulting from the opening of some of these ore bodies, which are situated within easy reach of the Grand Trunk Pacific Railway route.

SOUTH AFRICA.

Johannesburg, July 25.—At the Transvaal University College Mr. Lionel Phillips, one of the Rand mining magnates, in lecturing on the "Rand Gold Deposits" pointed out that mining operations on the Rand could, with profit, be carried on to a depth of at least 7,000 feet from the surface, and that, therefore, the Witwatersrand goldfield would not be exhausted during the present century.

It is generally considered here that, owing to the extremely unfavourable conditions for deep mining prevailing on the Rand, that mining operations will be possible at a much greater depth than 7,000 feet from the surface, providing an adequate method of hoisting is available, and the coming extensive use of electrical power for all mining operations on these fields seems the best likely to afford a solution to the deep winding difficulty. It must not be forgotten that on the Rand, as the mining operations deepen, the rate of increase in underground temperature steadily decreases. At first it was estimated at 1 degree Fahr. for every 82 feet, but when actually tested down to a depth of 1,000 feet, it was found to be 1 degree Fahr. for every 100 feet. Recent observations down to a depth of 3,500 feet, however, showed 1 degree for every 208 feet, and more recent tests have shown that over 4,000 feet the rate of increase was only 1 degree Fahr. for every 255 feet. There seems every likelihood of a constant decrease in the temperature gradient as greater depths are attained on these fields. Mines are working here at a depth of 4,500 feet without the slightest attempt at fan ventilation and, as a matter of fact, are dependent on natural ventilation and the compressed air used for power purposes. Eventually, it seems possible that the temperature gradient will fall as low as 1 degree Fahr. for every 400 feet or 500 feet in depth, so that as regards temperature that does not at present seem likely to form an insurmountable obstacle to deep mining on these fields. Then it must not be forgotten that the native labourer here is capable of working efficiently at much higher temperatures than the white labourer and this, again, is a valuable local asset to the prospects of ultra deep mining on these fields. The atmosphere here is also much drier than in other parts of the world, whilst the hanging and foot walls leave nothing to be desired. The banket rugs are equally hard and capable of standing a pressure of 7,000 pounds per square inch and, even if crushed, are not like coal seams, but will still retain their value. No matter what is said to the contrary the Witwatersrand is destined to become the scene of the deepest mining operations in the world and is destined for many years if not for centuries, unless some new field is discovered to continue to be the premier gold producer of the world.

Mining engineers and managers on these fields have been much concerned of late in the proposal of Mr. Hugh F. Marriott, of the Eckstein group of mines, that, instead of the ton milled being used as the basis of mine values and costs, the square fathom should be substituted, and at the Eckstein mines this is actually being done. For a long time past consulting engineers and mine managers have been strenuously striving, with considerable success, to bring down the working costs per ton milled and several of the large mines have been striving for first positoin in this respect. Mr. Marriott, however, is of the opinion that in the struggle for low costs per ton milled, the profits have been sacrificed owing to unpayable ore having been out

through the mill so as to produce a big divisor and low average cost per ton milled. It is, of course, quite possible, that in the recent rage for big outputs, mills and low costs, some managers may have put through the mill unpayable ore, but not when payable ore was available; but it is difficult to see how the substitution of a square fathom for a ton milled unit will prevent the practice. Coupled with this charge, however, Mr. Marriott is about to estimate the efficiency of the mine manager by the profits produced, but in that case the risks are much greater that the rock put through the mill may not be a true record of the capabilities of the mine, as there will be an inducement to exploit the rich sections and leave the poorer stopes to the next manager. At the Village Main Gold Mine, Mr. Marriott's proposals have been carried out and the profits have been thereby increased, although less tonnage has been milled and the costs have been slightly increased, but the better results are admitted to have been produced by revaluing the mine and abandoning the stopes which were estimated as unpayable, but it is difficult to see what this has to do with the tonnage or fathomage system proposed as the practice is equally applicable to both systems. This new proposal has created some annoyance amongst the American consulting engineers and mine managers employed by the Eckstein group, several having thrown up their positions rather than attempt to carry out Mr. Marriott's suggestions, whilst one has written a strongly worded paper to one of the leading engineering institutions of the Rand, which, at the present time, is down for discussion. It would seem that more is being made of the proposals than originally intended and probably the object of Mr. Marriott in removing the tonnage unit is to get it out of the way altogether, thereby enabling the consulting engineers and mine managers to devote their sole attention to increasing the profits no matter whether the tonnage costs increase or not.

The Vogel Deep Consolidated Mine is about to be closed down, the shareholders declining to find the necessary additional capital. The circumstances are somewhat peculiar as the reef was first struck about twelve years ago, since which date the company has undergone two reconstructions. It is most unusual here for a company to be reconstructed twice after proving the reef, and the general opinion here is that the present unsatisfactory condition of affairs is due to having spent the company's capital in erecting the mill before the mine had been sufficiently developed. The first development drives showed the reef to be quite payable, but these results were not confirmed by subsequent drives and stoping operations, whilst, owing to the bad hanging wall, it was found necessary to stope wider than originally anticipated, thus reducing the average value from eight to five dwts. It is urged that if the mill could be kept fully employed, then the mine could be worked without loss, and it certainly does seem strange that after considerable work has been done in the mine, it is found impossible to keep the mill fully employed. The difficulty is one entirely of mining and, if it was only grappled in a proper manner, it is abundantly clear that it would be quite unnecessary to close down both the mine and the mill.

The Government returns issued to-day show that the value of the Transvaal mineral output in June was as follows: Gold, £2,648,758, a decrease of £40,340 as compared with May; coal, £88,279, an increase of £3,120; silver, £7,534, an increase of £162, an increase of £3,120; silver, £7,534, an increase of coal and base minerals show a record output in value. No returns are issued monthly regarding the diamond industry.

Regarding the gold industry there were 103 mines producing in June, as compared with 106 in May; 9,853 stamps at work as against 9,912; 182 tube mills as against 177; whilst the total output in ounces of fine gold was 618,339 as against 629,873 in May. It must be remembered that June had one less milling day than May.

With regard to the coal trade there were twenty-seven collieries at work, producing saleable coal to the extent of 360,618 tons, which realized an average of 4s. 10d. per ton at the pit's mouth. The highest previous tonnage of coal sold was in May being 347,546 tons. The average selling price of coal at the pit's mouth was the lowest yet obtained in the colliery history of the Transvaal. A new coal association started on July 1st and slightly better prices are now anticipated.

The base mineral output of the Transvaal continues to expand steadily and for June the details are as under: Copper ore, 437 tons, value £8,873; tin, 306 tons, value £28,357; magnesite, 44 tons, value £132; flint, 249 tons, value £1,921; lime, 12,115 tons, value £19,200; asbestos and graphite, 5 tons with a value of £245; the total value being £58,728. The output of both tin and copper ore is expected to show a steady increase. For the other base minerals there does not seem much of an immediate future. An iron and steel industry is being started, but so far it is only intended to use up the scrap.

The half-yearly production of diamonds in the Transvaal was 1,147,779 carats of a value of £721,606, from January to June, 1910, whilst the production for the year ending June 30th, was 2,098,527 carats of a value of £1,317,479.

In the whole mining industry of the Transvaal there were employed during June 26,697 whites and 231,782 natives, the latter showing a slight decrease and the former an increase of 225.

The gold mines made an estimated profit in June of £955,170.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax.—In view of the fact that the bounties on steel are expiring next year, the Nova Scotia papers are beginning to agitate for higher duties as a measure of compensation.

In concluding a long letter on the subject, a correspondent of the Halifax "Chronicle," says:

"At the present moment the iron industry of Nova Scotia is in jeopardy. The federal subsidies all expire by next year and are not to be renewed. They were given to obviate the necessity of levying higher protective duties on a number of iron and steel products. But if Parliament, frightened by the vociferous campaign in the West, should refuse to grant compensatory duties in lieu of them, a great catastrophe in Nova Scotia must inevitably follow.

"I have no means of knowing exactly how much capital, home and foreign, is invested in the iron and steel works and coal mines of this province, but surmise that it is in the neighbourhood of $120,000,000. Nor can I tell offhand how many persons are employed in them; or how many more benefit by the labour of these men and by their trade and custom. It must be obvious to us all, however, that our duty as Nova Scotians, whether we be Liberals or Conservatives, is to use our best efforts to save these, our only great industries, from the fate that just now appears to threaten them."

Halifax.—The Nova Scotia Steel Company, since the re-lighting of the blast furnaces, has been putting all previous records for daily production far in the rear. Before the improvements in this direction were completed, the average daily output was 180 tons; since that time the average has been greatly increased. One day the output was 230, and on another it reached 275 tons.

Sydney, Sept. 10.—Manager Butler, of the Dominion Iron & Steel Company, said to "The Star" this morning: "Enquiries

are being received from Australia, South Africa, India, and other places for our rails, but as long as the Canadian demand keeps up to the output we are not very particular about the foreign orders. One more Bessemer furnace will be erected,'' said Mr. Butler. ''The order has already been placed, and the work will be begun this fall. It will take about three months to complete the work. Unskilled labour is hard to obtain here.'' Mr. Butler said the new immigration law requiring foreigners to have $25 before entering the country no doubt has an effect here. In reply to a question as to when the new blast furnaces would be ready for operation, Mr. Butler stated that it would be about six months. The steel work on the new furnaces, which was being done by the Canada Foundry Company, was being held back by several unforeseen delays. The Steel Company has bonded the iron areas at St. George's Bay, Newfoundland. There is a vast deposit of red hematite at this place.

NEW BRUNSWICK.

St. John, Sept. 9.—At a meeting of the shareholders of the Disrael Asbestos Company here to-day, it was decided, after a very lively discussion, to reorganize, pay off indebtedness and proceed with development work.

ONTARIO.

Kenora, Sept. 2.—Gold mining operations received an added stimulus Wednesday, when R. B. Nickerson, manager of the Mikado mine, brought in $1,200 gold bullion from the mine, the result of two days' run from the debris. The twenty-stamp mill will commence running in less than two weeks, and, as there is a good showing of ore in the stopes, returns are expected to be large. The Mikado mine, which is fifteen miles out on the Lake of the Woods, has been closed down for some seven years, and its reopening marks a new interest in this district.

ALBERTA.

Medicine Hat, Sept. 1.—In the closing hours of Sir Wilfrid Laurier's tour, the tariff question has again become paramount.

This time the city council and coal operators of Lethbridge pointed out to the government that reciprocity with the United States would enable the operators to find a market for their surplus supply in Montana. The United States farmers, seizing upon the premier's presence again, stated that they were satisfied with his utterances with reference to the tariff, but claimed that Hon. George P. Graham's idea of railway liability was not acceptable.

The coal industry around Lethbridge has attained a large growth, and, although the present supply is equal to the demand, new mines which are now opening will require a more widely extended market. Montana imports a considerable quantity of Lethbridge coal in summer time, but, as the local demand increases in winter, the supply for export falls off. Several members of Sir Wilfrid's party inspected shaft No. 6 of the Alberta Railway & Irrigation Company this morning, and ''The World'' correspondent was informed that people in Montana regarded the tariff against Lethbridge coal as a hardship, as being so far removed from any other source of fuel supply. Alberta coal enters that state without competition. It is estimated that $9,000,000 is invested in the coal industry around Lethbridge, and about 1,400 to 1,500 men are employed. The output of all mines cannot so closely be estimated, but the one in question has sufficient coal in sight to keep the plant busy producing 1,800 tons per day for 20 years. A farmer may drive up to the pit mouth and receive dusty diamonds for $3.85 per ton. The dealer in Lethbridge gets $4.50 per ton delivered, while Winnipeg is said to pay $8. The railways, however, are the worst sinners, and it virtually costs more to carry coal than to produce it. Local officials told the premier plainly that exclusive railway charges were killing the industry.

BRITISH COLUMBIA.

Fernie, Sept. 2.—The inquest to inquire into the circumstances surrounding the death of James Robey, who had his back broken in Coal Creek mines, was held in the provincial building last night. Only three witnesses were examined, and as none of these actually saw the accident, it was impossible to determine exactly how it happened. The jury came to the conclusion that the man had been killed by a runaway mine car and that the victim himself was responsible, for the reason that he had used a defective chain. The jury also recommended that the officials of the coal company use more care in seeing that the chains and other equipment in their mines be kept in good condition.

Nelson, Sept. 2.—A deal has been consummated by which L. B. Orchard and principals of Toronto buy an interest in the Evans group, situated on White Fish creek, a tributary of the St. Mary's River, about 20 miles west of Marysville, for $10,000 cash. The owners are William and Charles Evans, of Marysville, James Lemmon, of Moyie, and William McAllan, of Nanaimo. The claims carry copper, gold and silver, while a trace of nickel is known to exist. The ore is of medium grade, the veins running nearly east and west through a diorite formation. Stuart J. Schofield, of the Dominion Geological Survey, classes this formation as being identical with that of the copper-nickel mines of Sudbury, and speaks very highly of the district. Mr. Orchard is at present in England with a view to interesting further capital in the development of the group.

MINING NEWS OF THE WORLD.

WEST AFRICA.

The West African Chamber of Mines states that the gold yield of the colony for July was 15,564 ounces, valued at £58,551, a decrease of 1,630 ounces, or £12,437, as compared with the preceding month.

RHODESIA.

The total output of gold from Rhodesia for the month of July is cabled as 46,367 ounces, valued at £195,233, as against 51,016 ounces, valued at £214,709, in the previous month. This is a decrease on the month of £19,476. There were 173 gold producers last month. The output of other minerals for last month was: Silver, 18,723 ounces; lead, 61 tons; coal, 16,267 tons; copper, 5 tons; chrome ore, 3,304 tons; asbestos, 81 tons.

UNITED STATES.

New York, Sept. 1.—Yukon Gold declares the regular quarterly 2 per cent. dividend, payable October 1st.

Chicago, Sept. 2.—Following a conference between committees of the Illinois Coal Operators' Association and the Illinois body of the United Mine Workers of America yesterday, it was announced that the end of the strike of forty thousand coal miners is in sight and that to-day will probably see the end of the dispute which began April 1st.

Rhyolite, Nev., Sept. 3.—The Montgomery Shoshone is making a record for low cost of mining and milling which compares favourably with the most economical mining projects in the state. During the month of July, the cost sheet showed $1.90 per ton for mining, and $1.90 per ton for milling, or a total of $3.80 per ton.

Joplin, Mo., Sept. 3.—Word comes from Iola from an apparently reliable source that the Lanyon zinc smelters of that place are being wrecked and will be moved to Springfield, Ill. It is stated also that the acid works of the United States Zinc & Chemical Company are being razed and this plant will be taken to Kansas City, Kan., where this company has another large sulphuric acid factory.

Cripple Creek, Colo.—The production from the Cripple Creek district for August, as compiled from figures given out by mill managers, was $1,314,200, the highest production for any month of the year. The tonnage was 69,800. In comparison with July the values are $64,000 greater and the output is estimated at 17 tons more. The rich ore totalled 4,100 tons, exceeding July by 500 tons. The Golden Cycle report shows a gain of 2,000 tons over last month, or a gain of $5,000 tons in two months.

Leadville, Colo., Sept. 6.—August was the banner month of the year so far as the monthly output is concerned, reaching 74,000 tons of all classes of ore. The increase over the preceding month is due principally to the extra tonnage shipped from the outlying districts, and during the present month the tonnage from these districts should be increased over that of August. The increase over that of August, 1909, is fully 10,000 tons, due to the general revival of mining throughout the entire district. The outlook for the present month is that the tonnage will be increased materially, as the ore bodies caught during the month of August in the Yak tunnel, Cleveland, New Monarch, Dinero tunnel, etc., have been further developed, which will permit all of them to increase the daily output. It is also expected that the new shaft on the Colonel Sellers will be completed this month, and when it starts hoisting ore the daily tonnage will be increased fully 250 tons.

COMPANY NOTES.

CANADIAN WESTINGHOUSE DIVIDEND.

The Canadian Westinghouse Company has declared the regular quarterly dividend at the 6 per cent. rate, payable October 10th.

The T. & H. B. Company has just paid dividend No. 27, of 300 per cent. This is the sixth dividend of a like amount paid this year by this pioneer company.

In the closing months of 1908 the Canadian Iron and Foundry Company, Limited, the Canada Iron Furnace Company, Limited, and John McDougall & Company, were consolidated under the style, The Canada Iron Corporation, Limited. The majority of the shares of the Londonderry Iron & Mining Company, Limited, were also incorporated in the merger. The new company has blast furnaces in Ontario, Quebec and Nova Scotia, with foundries in the same provinces, and iron mines in these provinces and in New Brunswick as well.

For the short period ended May 31st, 1909, the net earnings were $146,743.39, on a preferred capital of $2,759,000. During the present year £100,000 bonds in the treasury have been sold, so that the present amount outstanding is $2,920,000. An increase has been made this year in the preferred stock, which now stands at $2,909,000, and of the $5,000,000 common authorized, $4,832,300 is now outstanding.

The annual report for the year ended May 31st, 1910, has just been issued, showing net earnings of $18,994.22. Accounts and bills payable are $2,533,490, against $1,505,640 last year.

The company were unfortunate this year in having two disastrous fires, namely at Montreal and Three Rivers, which undoubtedly made serious inroads into the profits.

BRITISH COLUMBIA COPPER COMPANY PROFITS.

The British Columbia Copper Company reports net revenue for August as $32,500. Copper was produced at 7.7 cents per pound. Only two furnaces were in operation.

TEMISKAMING COMPANY PROFITS.

In August the Temiskaming mine showed a profit of $103,969. The net value of ore produced was $125,984.

LA ROSE AND NIPISSING.

Directors of both the Nipissing and La Rose Companies have been notified of meetings to be held September 19th, when dividend action will be taken. Regular dividend will be forthcoming —3 per cent. and 2 per cent. extra on Nipissing, and regular 2 per cent on La Rose.

Nipissing is maintaining a monthly yield of about 400,000 ounces. The Kendall vein, which was uncovered several years ago, has proved a bonanza for the company, and it has to date contributed $2,000,000 to income.

La Rose has recently uncovered at a depth of 135 feet in the Princess mine a vein which has assayed between 3,500 and 4,000 ounces, and which is looked upon as a second "Kendall." If the vein holds good for a distance of 100 feet with similar values the company's dividend requirements at the present rate for a full year are assured from this one section of the property.

La Rose has paid in dividends during the past year $600,000, but its treasury position will probably show a much improved condition in a few months.

STATISTICS AND RETURNS

CROW'S NEST OUTPUT.

The output from the Crow's Nest collieries for August amounted to 109,000 tons, as compared with 73,000 tons during August of last year, an increase of almost fifty per cent. The output during this year has shown a substantial increase over last year, when, of course, the company had not fully recovered from the first of August, 1908. At the same time by August of last year production was again on its normal basis, which makes the present large increase the more encouraging. The figures for the past four months compare as follows:

	1910.	1909.	Increase.
May	92,900	54,000	38,900
June	116,450	83,400	33,050
July	104,000	72,000	32,000
August	109,000	73,000	36,000
Total	422,350	282,400	139,950

CONSOLIDATED ORE RECEIPTS.

The Consolidated Mining and Smelting Company of Canada reports ore receipts at Trail smelter for the week ending September 3rd as 7,536 tons; year to date 320,711 tons.

HILLCREST SENT 18,000 TONS.

August shipments of the Hillcrest Collieries amounted to 18,000 tons. Development work is steadily progressing. The new slope is down 125 feet, in a 16-foot vein of first-class steam coal.

RAND GOLD OUTPUT.

The August gold output of the Rand is estimated at 640,000 ounces fine.

Comparison of the value of the August output, on the basis of the above estimate, is:

August, 1910, $13,760,000; August, 1909, $12,988,000.
July, 1910, $13,565,000; August, 1908, $12,484,000.
June, 1910, $13,278,000; August, 1907, $11,788,000.
May, 1910, $13,468,000; August, 1906, $10,812,000.
April, 1910, $13,147,000; August, 1905, $9,102,000.

COBALT ORE SHIPMENTS.

Both Kerr Lake and La Rose were out of the shipping last week, and the total output from the Cobalt camp was unusually small, the ore consigned being only 478.95 tons. The Nipissing sent out only three cars. The Central, shut down for a short period, is now running again for the benefit of the creditors and they sent out a small car of concentrates. The Colonial is another "occasional" that has started up operations again. From their mill they shipped 23 tons to Denver, Colorado.

The shipments for the week ending September 9th, in pounds, and approximate values were:

McKinley-Darragh, 5 h	242,390
Nipissing, 3 l	192,180
Crown Reserve, 1 h 1 l	141,450
O'Brien, 1 h	66,270
Buffalo, 1 h	62,140
Hargraves, 1 l	60,000
Temiskaming, 1 l	60,000
Central, 1 h	46,910
Colonial, 1 h	44,580
Trethewey, 1 h	41,990
11 h, 6 l	957,910

The shipments for the week ended September 9th and for the year 1910 now read:

	Week ended Sept. 9th.	Year to date.
Nipissing	96.09	4,203.09
La Rose	.....	4,105.37
Kerr Lake	.....	3,714.47
Crown Reserve	70.72	2,339.07
McKinley-Darragh	121.19	1,397.68
Temiskaming	30.00	814.70
Buffalo	31.07	801.70
Chambers-Ferland	.....	610.23
Right of Way	.....	609.23
Coniagas	.....	612.92
O'Brien	53.13	372.08
Trethewey	20.99	378.42
Drummond	.....	336.76
City of Cobalt	.....	236.94
Little Nipissing	.....	213.93
Cobalt Central	23.45	243.13
Hudson Bay	.....	201.22
Hargraves	30.00	170.53
Townsite	.....	144.67
Cobalt Lake	.....	117.30
King Edward	.....	111.12
Silver Cliff	.....	106.28
Colonial	22.29	105.59
Beaver	.....	57.53
Provincial	.....	32.05
Waldman	.....	31.99
Rochester	.....	30.37
Wyandoh	.....	24.15
Casey	.....	17.90
Total	478.95	22,015.67

COBALT SHIPMENTS.

The Cobalt mining district is producing more silver at a lower cost than at any previous time in its history, notwithstanding a marked decrease in speculative interest.

For the first seven months of 1910 Cobalt shipped a total of 18,029 tons of ore, as against 29,942 tons for the whole of 1909, 25,265 tons in 1908, and 14,788 tons in 1907. During the first year of Cobalt's existence, 1904, the total output was 158 tons. At the present day the output is about 15 per cent. of the total production of the world.

In the following table is shown the number of ounces of silver and their values for the several years since 1904:

	Tons.	Silver, Oz.	Value.
1910†	18,029	15,491,000	$8,320,336
1909	29,942	25,885,985	12,456,301

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending August 26th, and those from January 1st to date:

	Aug. 26. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	.....	180,617
Buffalo	59,240	1,484,198
City of Cobalt	60,140	482,875
Chambers-Ferland	.....	1,149,100
Cobalt Central	.....	293,286
Cobalt Lake	.....	260,900
Cobalt Townsite	66,000	302,840
Colonial	.....	148,900
Coniagas	.....	1,119,616
Crown Reserve	181,090	4,545,110
Drummond	.....	664,200
Hargraves	.....	281,170
Hudson Bay	.....	360,825
Kerr Lake	480,000	6,944,640
King Edward	.....	221,296
La Rose	170,320	8,193,341

McKinley-Darragh	180,260	2,484,189
Nipissing	445,340	7,922,047
O'Brien		822,146
Peterson Lake		432,420
Provincial		65,000
Right of Way	111,420	1,191,637
Rochester		60,750
Silver Cliff		212,770
Standard Cobalt		147,992
Temiskaming	120,000	1,428,080
Trethewey		725,380
Waldman		63,992
Wyandoh		48,300

Ore shipments for the week ending August 26th were 1,873,810 pounds, or 936 tons.

Total shipments from January 1st to August 26th were 42,237,617 pounds, or 21,118 tons.

TORONTO MARKETS.

Sept. 9.—(Quotations from Canada Metal Co., Toronto).

Spelter, 5½ cents per lb.
Lead, 3.65 cents per lb.
Antimony, 8 to 8½ cents per lb.
Tin, 38 cents per lb.
Copper, casting, 13.25 cents per lb.
Electrolytic, 13.25 cents per lb.
Ingot brass, 9 to 12½ cents per lb.

Coke.

Sept. 7.—Connellsville Coke (f.o.b. ovens).

Furnace coke, prompt, $1.60 to $1.65 per ton.
Foundry coke, prompt, $2.10 to $2.25 per ton.

Sept. 7.—Tin (Straits), 36.20 cents.

Copper, Prime Lake, 12.75 to 12.87½ cents.
Electrolytic copper, 12.50 to 12.60 cents.
Copper wire, 14.00 cents.
Lead, 4.47½ cents.
Spelter, 5.55 cents.
Sheet zinc (f.o.b. smelter), 7.50 cents.
Antimony, Cookson's, 8.20 cents.
Aluminium, 22.00 to 22.50 cents.
Nickel, 40.00 to 47.00 cents.
Platinum, ordinary, $34.00 per ounce.
Platinum, hard, $36.00 per ounce.
Bismuth, $1.85 per lb.
Quicksilver, $46.00 per 75-lb. flask.

ON TIME

One of the most important business transactions which sensible minded men should perform on time is that of making proper provision for those who are dependent on them for the necessities of life.

The only way to do this is by means of life insurance. The only way to do it on time is to act now while in health. The most satisfactory way is to insure at once in the

Nissen Stamp Mills

Will Save 50% of Your Power

Owing o the maximum crushing efficiency secured, the power required to operate **NISSEN** Stamp Mills in about half that of other mills of the same capacity output.

The Nissen Stamp in Cobalt

Read what a Supt. writes:

NORTHERN CUSTOMS CONCENTRATORS, LIMITED.
COBALT, ONT., December 31st, 1909.

The Canadian Fairbanks Co., Toronto, Ont.

Dear Sirs:—

In answer to your inquiry regarding the Nissen Stamps supplied by your firm. These stamps are running steadily on some of the hardest rock on the Continent, they are crushing 5.3 tons of ore per head in twenty-four hours. The feed rolled down to go through about a one inch hole.

The screen used for the above tonnage was 30 x 30 mesh, 28 gauge wire, opening 018. With a coarser screen the tonnage would of coarse be larger.

The shoes and dies wear even, and the splash is well distributed over the screen.

The arrangements for keeping up the weight of the stamps are very good.

I can recommend the stamps. Yours truly,

(Sgd.) F. J. Bourne, Superintendent.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price,

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE FOLLOWING GEOLOGICAL MAPS HAVE BEEN RECENTLY ISSUED:—

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1025. Waverley Sheet. Scale 1 mile to 1 inch.
1037. Windsor Sheet. Scale 1 mile to 1 inch.

QUEBEC

1079. Geological and Topographical Map of St. Bruno Mountain, Chambly Co., Que. Scale 800 ft. to 1 inch.

ONTARIO

1076. Gowganda Mining Division. Scale 1 mile to 1 inch.
1061. Explored routes in a portion of North Western Ontario, traversed by the National Transcontinental railway between Lake Minnitaki and Lake of the Woods. Scale 4 miles to 1 inch.

ALBERTA

1032. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland. Scale 400 feet to 1 inch.
1004. Geological Sheet, Rossland Mining District. Scale 1200 feet to 1 inch.
1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1105. Map No. 4A. Geological—Golden Zone Mining Camp near Hedley, B.C., by C. Camsell. Scale 600 feet to 1 inch.
1106. Map No. 3A, Geological—Mining Claims on Henry Creek near Hedley, B.C., by C. Camsell. Scale 800 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1041. Geological Map Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of the ore bodies of the same belt.
1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.
973. Catalogue of Canadian Birds, by John Macoun and James M. Macoun.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotland Part I, Economics, Part II Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon and Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
980. Report on a portion of Algoma and Thunder Bay Districts, by W. J. Wilson, and on the region lying north of Lake Superior between the Pie and the Nipigon Rivers, by W. H. Collins. A map showing the geology along the water courses from Lake Superior to the Albany River and from Missinabi to Nipigon River accompanies the report.
1075. Report on the Gowganda Mining Division 1908, accompanied by a map, by W. H. Collins.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.

YUKON and NORTH WEST TERRITORIES

1050. Whitehorse Copper Belt, accompanied by maps, by R. G. McConnell.
1097. A Reconnaissance across the McKenzie Mountains on the Pelly, Ross and Gravel Rivers, Yukon and North West Territories, with map, by Joseph Keele.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Book Dept. CANADIAN MINING JOURNAL, *Confederation Life Building* TORONTO

Geology Applied to Mining

By Josiah Edward Spurr, A.M.

Mining men, prospectors, investors and students have found this book a treasure house. It is a plain, simple, straightforward application of economic geology to mining problems. It is a concise summary of the principles of ore deposits for the man who wishes to exploit them. It isn't *geology*, but *geology as applied to practical mining.* It boils down the abstract science for the practical mining man and student—the processes of deposits, the arrangement of stratified rocks, igneous rocks, structures, placers, chemical geology, etc., etc.

Library edition, cloth, $1.50 net, postpaid

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

Made in Two, Three and Four Pole Styles.

Although specially designed for industrial, mining and general motor applications being placed in any position convenient to the motor, they are also adapted to switchboard mountine. Type "H" Breakers can be used on both alternating and direct current circuits, and have a maximum capacity of 100 amperes at 500 volts. Their calibration range is from 80 to 160 per cent. of rated carrying capacity. While automatic in action it can be tripped by hand by means of a small lever on the side of the case.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

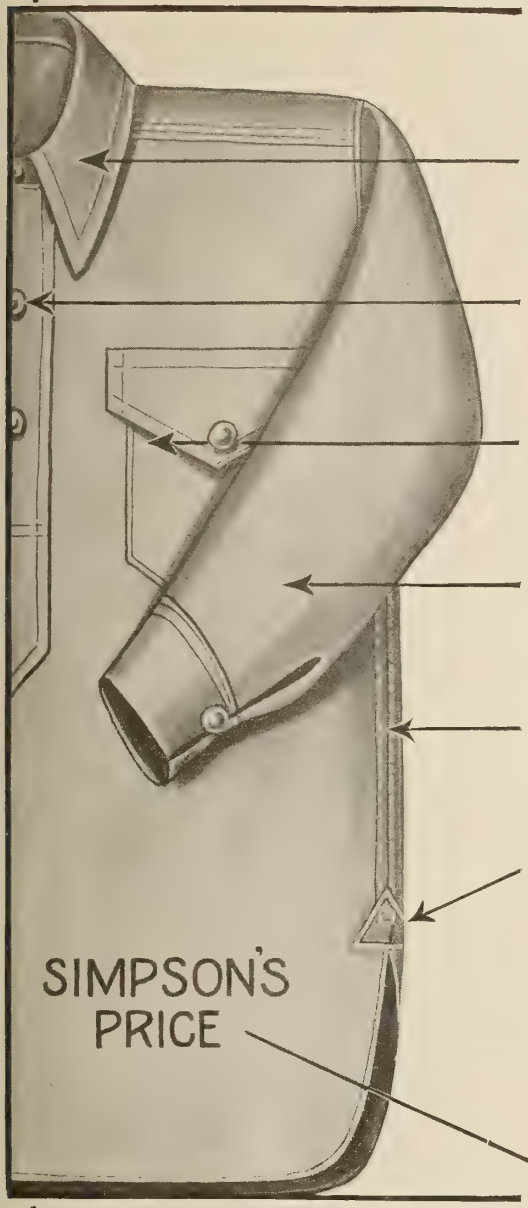
"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines



Nobel Monobel, Saxonite and Carbonite.

KHAKI DUCK SHIRT

For Miners, Lumbermen, Prospectors, Surveyors

MADE THE SIMPSON WAY

NOTE THE DIFFERENCE FROM THE ORDINARY WAY:—

COLLAR will fit neatly, all ways, all the time. Is well interlined to retain its shape. Steels inserted to prevent curling points.

DOME FASTENERS of brass used throughout. No buttons to come off. No occasion to swear. A feature that will be appreciated by every man.

POCKET Two pockets, one on each side, with dome fastened flap. A splendid idea. Plenty of *pocket space* is a Simpson improvement.

SLEEVES are made large. Plenty of elbow room. Inter-lined wrist-band, dome-fastened. One of the strong points not to be overlooked, viz.—roomy sleeves.

DOUBLE STITCHED seams throughout, with extra strong thread insuring strong wear. This Simpson shirt is made stronger to wear where the most wear comes.

GUSSETS are made strong and double stitched, adding extra strength. You can be absolutely sure the seams will not rip at this point.

FABRIC extra heavy khaki duck. Wind-proof and shower-proof. Will stand the hardest kind of wear. Try it. Almost indestructible.

"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just because it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be the stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we **know**, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs **per year** than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line, As you have everything to gain and nothing to lose, why not investigate NOW?

BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

THE

MINING MANUAL

1910

BY WALTER R. SKINNER.

The Standard Reference Work on Mines.

Price 17/- net Post Free (Abroad).

1,600 pages. In demy 8vo, handsomely bound in RED cloth.
A record of information concerning

MINING COMPANIES
(Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, Exploration and Mining Investment Concerns, &c.)

Arranged in three sections—

Australasian, African, Miscellaneous,

Preceded by Tables of Crushings and followed by lists of Mining

DIRECTORS, SECRETARIES, MINING and CONSULTING ENGINEERS and MINE MANAGERS.

Their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected, and a

DICTIONARY OF MINING AND OTHER TERMS.

THE MINING MANUAL for 1910 contains particulars of over 3,600 Companies arranged in three sections, 430 Companies being AUSTRALASIAN (including Western Australia, Queensland, Broken Hill, Deep Leads, New Zealand and Tasmania); 1,030 AFRICAN (including Transvaal, Rhodesia ,West Africa, Cape Colony, Natal, Egypt); and 2,140 MISCELLANEOUS (including Siberia, Mexico, India, British Columbia, America, &c., and the Coal, Iron, Tin and other Mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; plant erected or in course of erection; present working results; ore reverses; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts. Highest and lowest prices of the shares for the last four years, also latest price. The three sections extend over 1,100 pages,

Crushing tables and Gold Outputs from the principal mines are given at the commencement of the volume, showing tons treated monthly, results obtained, and yield per ton; also annual yields.

The Lists of Directors (8,000), Secretaries (1,900, Mining and Consulting Engineers and Mine Managers (1,400) include their addresses and descriptions and names of the Companies with which they are connected.

A complete Alphabetical Index, containing the names of 5,300 Companies and including many useful items of reference, occupies 42 pages.

Full particulars of all Re-constructions, Re-organisations and Amalgamations during 1909 are given in a simple and concise form.

Are You "Killing" Your Expensive Machinery

by installing it in poorly constructed—vibrating—fire-threatened buildings?

The "BEATH" SYSTEM of triangle-mesh RE-INFORCED CONCRETE

ensures permanent fireproof structures, resisting vibration and thus adding to the life of the machinery.

And the cost of construction is surprisingly small. Let us get in touch—write us about your needs.

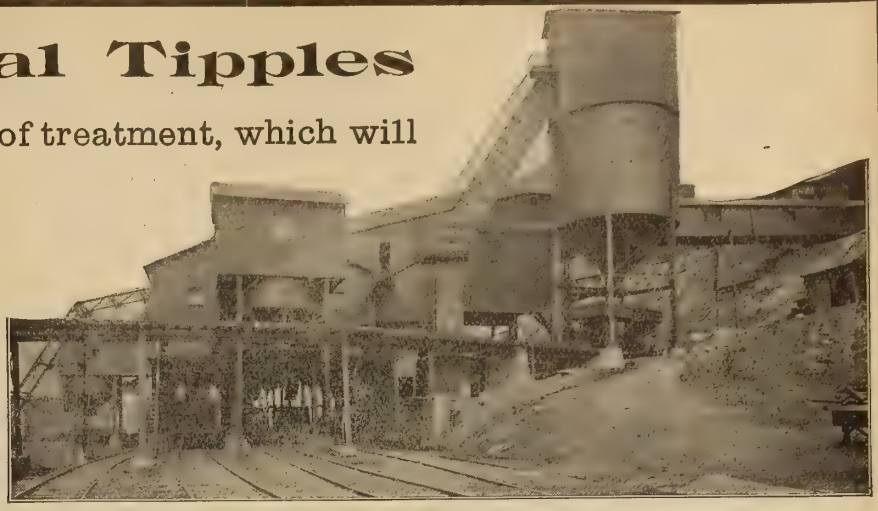
Also enquire about our metal roofings.

W. D. BEATH & SON - - Toronto

The South African School of Mines and Technology, Johannesburg.

Owing to the present Principal and Professor of Mining of The South African School of Mines and Technology having been appointed Consulting Engineer to one of the Witwatersrand Minning Houses, the Council invites applications for the joint position, or alternatively for the chair of Mining alone. The salary attached to the chair of Mining is £1500 per annum. This would be increased by £250 per annum if the Professor were also appointed Principal of the School.

Particulars with regard to the School and the vacant posts may be obtained on application to:—



The Registrar, McGill College and University,

Montreal, Canada.

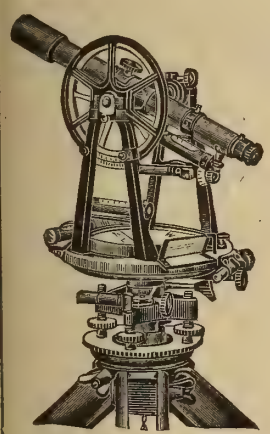
Applications must be sent so as to arrive in Johannesburg not later than the 30th November, 1910. They should be addressed to:—

THE SECRETARY,
P. O. Box 1176,
Johannesburg.

Jeffrey Coal Tipples

Embody modern methods of treatment, which will insure increased value per ton of coal produced.

We are prepared to design, erect and equip Coal Tipples complete with every detail carefully adapted to meet special requirements of existing conditions.



Our long experience in the design and construction of Coal Tipples enables us to combine the latest and most successful methods obtaining in tipple practice.

If you have any Tipple problems, call on our expert engineers, who will gladly assist you. Send us your name for our Tipple Book X 22.

GOWGANDA TO-DAY.

We recommend to our readers the article "Gowganda" that appears in this number of the CANADIAN MINING JOURNAL. It is written by Mr. G. M. Colvocoresses, who is manager of one of the successful mines of that neglected district, and who has been responsible from the first for the development of the mine that he superintends. Mr. Colvocoresses speaks with the temperance that is born of experience.

Perusal of the article leads to the conviction that to dub Gowganda a failure is unwarranted and unfair. Gowganda's good name was almost fatally wounded by fakirs and fools. Moreover, Gowganda has been injured by quite absurd comparison with Cobalt. As Mr Colvocoresses points out, Gowganda is not, and may never be, in the same class with Cobalt. But Gowganda promises to make a respectable younger sister.

One important point dwelt upon in the article refers to the mistake of looking upon Gowganda as being solely a high-grade camp. "A very considerable quantity of milling ore assaying from 30 to 100 ounces of silver per ton is now being developed," says Mr. Colvocoresses. Further, he affirms his belief that the greater part of Gowganda's production will eventually come from mills treating comparatively low-grade rock, which is excellent concentrating ore.

This fact bears essentially upon the future of the camp, and is surely full of meaning. Given the assurance of large reserves of low-grade milling ore, a railway into Gowganda becomes perfectly feasible. At present it is out of the question to move large quantities of freight into or out of the camp. The erection of mills must be postponed, therefore, until such time as a railway is built. We believe that the Ontario Government cannot long refuse to guarantee the construction of a railway. Or, rather, we may reasonably assert that the Government will be glad of good cause to take action. It looks not unlikely that good cause can be shown.

The story of Gowganda accentuates one basic truth. That truth is that in the selection, in the development, and in the operation of mining properties, level-headed competent men are needed. Never was illustration so complete, nor contrast so startling. A collateral truth is that competent men must take some measures to protect first the camp and next themselves from the reproach brought on all by the unrighteous. Gowganda lost years of growth through the reckless cupidity of the get-rich-quick class.

Quite by-the-way, our readers must not imagine that Gowganda is a land of perpetual snow. It is a sad fact that most of our photographs are taken during the

winter. In summer, luxuriant foliage springs up and blocks the camera.

To the careful, vigorous and sustained efforts of a few mine managers Gowganda owes its present healthy condition. These men we congratulate.

PRACTICAL CONSERVATION.

The Nova Scotian Department of Mines has issued a statement form that is designed to furnish a complete yearly record of the extent of the coal mining operations conducted by each colliery. The form is designated "Coal Depletion Statement." The items are sufficiently inclusive to show the amount of coal mined, the reserves developed, the amount of coal remaining in old workings, the tonnage recoverable, the percentage of extraction, and the total area worked over. Each manager will be compelled to fill in this form.

The commercial value of this step can hardly be overestimated. Not only does it provide means for forming a close annual estimate of actual coal reserves, both old and new, but it also will remove many erroneous conceptions as to the status of Nova Scotian collieries. Particularly this will be true of certain Cape Breton collieries, whose areas are mainly submarine.

One of the first revelations that will be brought out by "Coal Depletion" returns will be the fact that in many collieries there are enormous quantities of available coal remaining in old workings. There are areas, in fact, where, in old workings, the remaining recoverable coal exceeds the quantity extracted. An estimate of this class of reserves is vitally important.

Much light will be thrown upon the applicability of methods used. The determination of the percentage of coal loss or not recoverable will afford a fair standard of comparison between simlarly conditioned collieries. Here, however, we would suggest that the item, "Percentage loss or not recoverable," be divided into two distinct, and not alternative, items. The reasonableness of this suggestion is obvious.

As we present herewith a reproduction of the "Coal Depletion Statement," further comment upon the form is not needed. But it is appropriate to urge upon the

Coal Depletion Statement.

Remarks

other coal-producing provinces the exigent need of following in Nova Scotia's steps. They will thus be advancing in a practical and useful manner the work of conserving our natural resources. The word "conservation" is limited arbitrarily by the unthinking to apply merely to nature untouched by man. But the one great lesson that all of us must learn is the duty of using properly what we actually possess. Nova Scotia has mastered the alphabet.

AMERICAN LABOUR UNIONISM IN CANADA.

That American labour unions are losing ground in Canada is patent. It follows, naturally, that home-made labour unions are gathering strength. But the most pregnant fact is that there is now definitely declared opposition to the invasion of Canada by American labour organizations.

For this the costly strike forced upon the employees of the Dominion Coal Company may be thanked. In this strike loud-mouthed agitators from the other side, aided by irresponsible local disturbers of the peace, attempted to gain absolute control of the workmen and to destroy the purely Canadian organization, the P. W. A. In this attempt they failed. Their methods could not carry them to lasting success. They appealed not to the loyalty and decency of the men, but to their cupidity. And good resulted from evil, for the P. W. A., a body deserving of confidence and respect, fought a good fight and emerged strong and confident.

To those who watch current events it would seem a national calamity were American unionism ever to dominate Canada. We are quite capable of conducting our own affairs. If we may judge by a comparison of the U. M. W. A. with the P. W. A., it is obvious that our labour leaders are saner and wiser citizens than any of their foreign opponents.

MINERS' PHTHISIS.

The report of the South African Mining Regulations Commission states that while the death rate among surface and underground white mining males in the three years, 1905, 1906 and 1907, was comparatively low, yet this low death rate concealed a very high mortality among a limited class of white rock drillers. The death rate among mining males is 60 per cent. higher than among those who are not constantly underground. Miners' phthisis (silicosis) carries off six times more underground workers than surface employees. The exact figures of underground death rates are not obtainable as it is known that a considerable number of the afflicted go home to Cornwall to die.

The Commission's Report emphasizes the fact that miners' phthisis is induced almost entirely by the inhalation of dust created by rock drilling and shovelling, and, incidentally, by air vitiation after blasting. The terrible condition of affairs is illustrated by the statement that the average term of rock drillers' employment is seven to nine years; that is, a driller's usefulness is gone after he has worked from seven to nine years.

As a preventive, the Commission strongly urges the compulsory use of sufficient quantities of water. It is pointed out, however, that the men, and not the managements, are to blame. The miners are incredibly indifferent to the danger of phthisis. As a necessary measure it is recommended that no tuberculars be permitted to work underground.

ONE VIEW OF MODERN EDUCATION.

A passage in the inaugural speech of Dr. James Moir, president of the Chemical, Metallurgical and Mining Society of South Africa, is so apt that we quote it here in full. Dr. Moir hits hard and straight:

"What is wanted of modern education is that it shall produce a man who is both a gentleman and an accurate problem-solver; as an American writer says, 'it is necessary to understand that moderately accurate knowledge is like a moderately fresh egg;' and I may say at once that accurate knowledge is not to be gained from text-books and a 50 per cent. pass examination, but solely from the experimental method. Unfortunately, as Armstrong says, our headquarters are 'people who have never knowingly made an experiment, and do not even know how to set about making one.' The result is seen in the so-called 'educated population,' three-quarters of whom still believe in water-diving, or in finding live frogs in stones or similar superstitions, all on evidence, too, that wouldn't convict a nigger. Even the universities want reforming badly: they should leave text-book examinations to preparatory schools, and they should give proper scientific degrees. Why, for example, should the Cape University call a man a Bachelor of Arts after he has passed an Honours examination in Science? What they should organize is a degree in Technics, or Applied Science, only to be given after training in experiment and research. I assume, of course, that elementary science will have been taught at school. The fact is, that British university training, is, almost everywhere except in Scotland, modelled on the Oxford and Cambridge type: the former of these universities apparently considers the acme of human culture to consist in the knack of rendering into more or less indifferent Greek such things as 'we don't want to fight, but by Jingo if we do,' whilst the strong point of the other university appears to be the cultivation of a certain carefully artificialized variety of English speech; and, in both universities, sad to say, Chemistry, almost the most fundamental branch of human knowledge, is relegated to a back seat under the name of 'Stinks.' I will myself say nothing of the educative and disciplinary value of chemistry; let Nernst speak: 'the doctrine of the constitution of organic compounds stands at the head of all theories that the human mind has ever conceived.'"

THE INTERNATIONAL GEOLOGICAL CONGRESS.

From the gathering together of professional men there comes good. The Canadian Mining Institute transcontinental excursion, in 1908, brought definite and prompt commercial results. Also it established many lasting friendships. It is not to be doubted that the recently concluded International Geological Congress will induce similarly beneficent effects.

Dr. W. G. Miller, who was Ontario's representative at the Congress, contributes to our pages a very interesting account of the convention in Sweden. In commenting upon certain iron mining enterprises, Dr. Miller alludes to the surprisingly good treatment accorded to the Swedish miners. The mining towns are commendably clean. The men are well cared for and are well paid. Living expenses are low. Pensions for long service, and insurance against injury are provided. Herein is food for thought.

Canadian operators, especially operators of iron mines, will do well to read carefully and to digest thoroughly this highly informing article.

EDITORIAL NOTES.

The State Geologist of Wyoming, Mr. Edwin Hall, recognizing the evil wrought by long-distance promoters, wrote lately a strong letter on the subject of oil promotions in Wyoming. At the request of Sir Boverton Redwood, to whom the letter was addressed, the communication was published in full in "The Financial Times," London, Eng. Mr. Hall has a practical sense of his duty to the public and to his own state.

Judge Mabee, as chairman of the Dominion Railway Commission, has given recently a decision that bears upon the mining development of northern British Columbia. It appears that, contrary to specific agreement, the White Pass & Yukon Railway has fixed an exorbitant freight rate as between Carcross and Skagway. This rate the Commission decided to cut in half.

A fourth edition of the geological map of the Cobalt area has recently been published by the Ontario Bureau of Mines. The first edition was issued in 1904 before Cobalt had attracted the attention of the public, and was of service to the early prospector in the camp. There have also been reprints of the first three editions. Separate maps have been published from time to time of South Lorrain and other areas contiguous to Cobalt. The last edition combines therewith the area mapped in 1904 and includes the Gillies Limit. The new map is in the same scale as the former ones, 1 mile to 1 inch. The large scale map, 400 feet to 1 inch, was published in 1907.

Great Britain imports granite in large quantities from Belgium, and marble from Italy. The great bulk of imported granite, however, comes from the Channel Islands.

PRESENT DEVELOPMENTS AT GOWGANDA

(Written for the Canadian Mining Journal by G. M. Colvocoresses.)

People visiting Gowganda this summer complain that the camp is very quiet and, from some points of view, this is certainly a fact. From the standpoint of the boomer Gowganda is now numbered among the down-and-outs, and in the columns of certain daily papers it no longer furnishes the settings for thrilling romances of the Monte Cristo order. On the other hand, there is more real serious development and mining work going on than at any time in its short history, and in many cases the results are highly encouraging.

A glance over the present situation shows both bad and good points; the latter I think predominate. The failures that have already been recorded can nearly always be traced to one of two causes,—trying to mine where there is no silver, or lack of sufficient capital to develop properly the property. The last mistake can often be rectified in time; the first is bound to be fatal. There is no excuse for people who buy claims that they have never seen nor have sent any responsible person to examine; no more is there for those who purchase a property on which has been found diabase, calcite and the so-called "aplite," with the conviction that large bodies of pay ore must necessarily be associated with these rocks; and there seems but little more excuse for the men who paid $100,000 in cash, on the surface showing of a single tiny vein with a high grade silver ore shoot two feet in length, three-quarters of an inch wide, and developed by test pit eight feet deep. As a matter of history the ore shoot referred to and many others like it have never produced $100 worth of silver.

At the present time several Gowganda properties are closed down or operating with reduced forces of men. Some of these properties have not been able to find any ore, but in other cases promising finds were made and the suspension of work is due to financial difficulties or lack of power plants, which cannot be installed until next winter. In these cases the management figures that it will be more advantageous to wait until winter than to continue work by hand throughout the expensive summer months. I say expensive summer months because Gowganda is a topsy-turvy place in this respect. It is fifty miles from the railroad and in the midst of a forest, where nothing edible is yet grown and no industries or settlements are established. In winter, over the snow road and lakes, it costs $1.50 per 100 pounds to bring in supplies from the railroad; in summer by boat to Elk Lake, and thence by a very rough wagon road, it costs $2.50 to $3.00 per 100 pounds, with a practical impossibility of hauling in boilers or heavy machinery. So instead of laying by supplies for the winter, Gowganda takes advantage of the winters to bring in its machinery, send out most of its ore and lay in supplies to last until the succeeding December. Some day, it is to be hoped that a railroad will find justification for building

Camp and Power Plant, Millerett Mine

into the camp, but that has not yet been the case. After all, Gowganda is barely two years old, and development under the existing conditions is of necessity slow.

On the bright side of the picture it may be said that Gowganda has already (September 1st) shipped out 415 tons of cobalt-silver ore, contributed by seven different mines, and another 100 tons is now bagged up in the ore houses. About 120 tons of the production is high grade ore assaying between 3,000 and 4,000 ounces in silver per ton, and the balance is second grade ore assaying somewhat less than 800 ounces per ton. Besides this there are several thousand tons of low grade ore on the dumps awaiting the arrival of concentrators, of which I shall have more to say later.

Another encouraging point is the continually widening area in which good properties are being developed. Last summer nearly all underground work was confined to the Gowganda ridge and the Miller Lake section, whereas this year development is going on to the south and west at Smoothwater, Wapoose, Spawning, Duncan, and Shining Tree Lakes, and to the east at Calcite. Bloom, Lost, Wigwam, and Long Point Lakes. At all these places some ore has been bagged up and it looks as if productive mines might be developing.

The geology of the Gowganda district is similar to that of Cobalt and the Montreal River section, and I shall not describe it in detail. The rock formations are Keewatin greenstones, Laurentian granite and gneiss; Huronian conglomerate, slates, graywackes, quartzite, and Pre-Cambrian diabase. With one notable exception all the producing veins have so far been found in the diabase.

The original discoveries of the camp were nearly all made on bald bluffs and ridges, but this seems merely due to the fact that these ridges required no stripping and were most easily prospected. Subsequent work has uncovered equally good veins under overburden and in the hollows and when the underground exploration gets under the muskegs and shallow lakes which occupy a very large area there is good reason to believe that, as at Cobalt, important finds will be made beneath them.

A more detailed description of some of the mines in the camp may be of interest, the properties mentioned being those on which the development work has been most extensive and with which the writer is best acquainted. There are many other properties which from present indications will have equal merit.

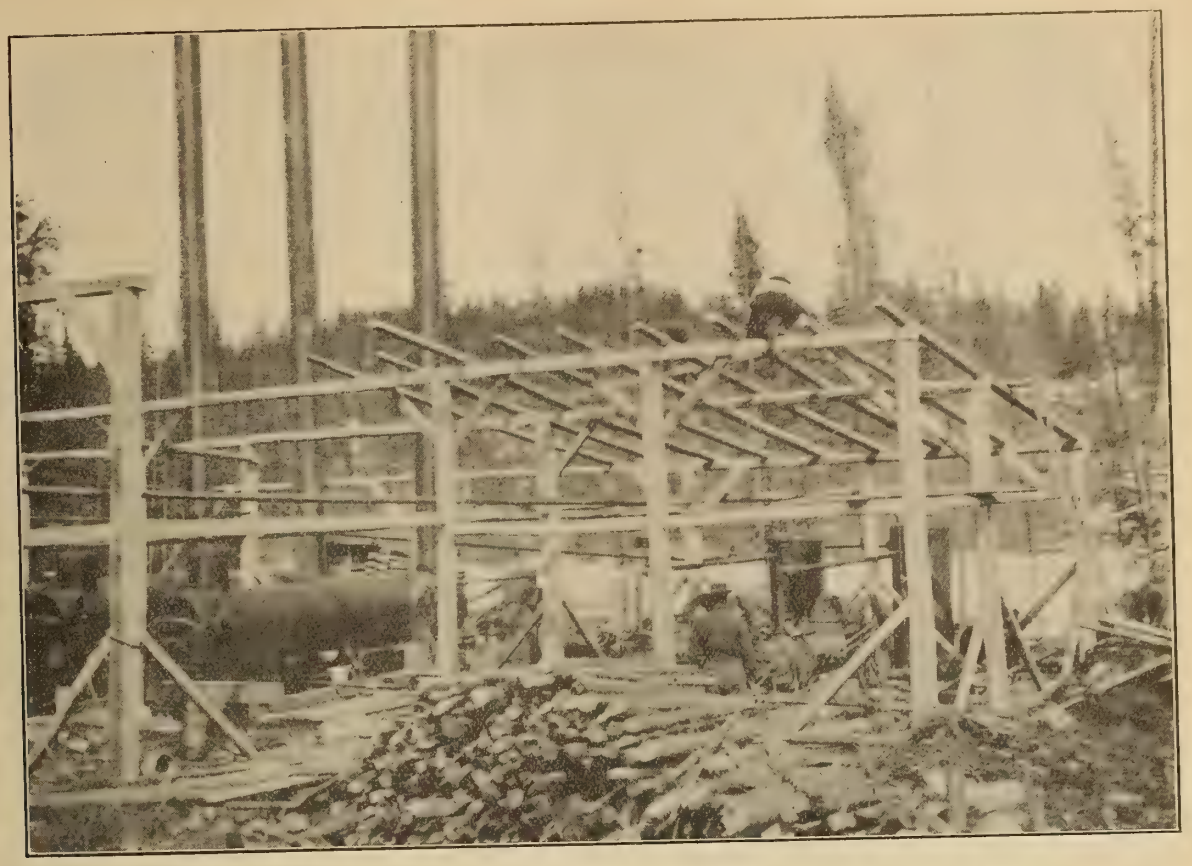
Near the south end of the "Ridge," just west of Gowganda Lake, is located the Bartlett mine, which for certain reasons was once the most widely known proper-

Car Load of Ore Leaving Mine for Charlton

No. 1 Shaft, Millerett Mine, April, 1910

ty in the camp. The prospect itself appears to have real merit. The surface showings were very fine and two shafts some distance apart have been put down to a depth of 100 feet. Very little drifting or crosscutting was done at this level. The ore shoots appeared to pitch in the veins and no ore was found in the bottoms, though it had shown up strong for 40 or 50 feet in depth. Some high grade ore over three inches in width was taken out in sinking these shafts; one ton was shipped out last summer by canoe and a few tons are left in the ore house. The mine is equipped with the largest plant in the camp, much too elaborate for a prospect. This consists of two 85 h.p. return tubular boilers, a 12-drill compressor, high speed engine and generator for electric lights, large hoists, pumps, machine shop, etc. The cost of the plant and its erection is said to have been $125,000, and after this expenditure there was comparatively little money left for development work, and in December, 1909, the mine closed down. Since then the company owning this property has been partially reorganized, and it is to be hoped that operations will shortly be resumed and the mine be given a chance to show its value as an ore producer and not as a vehicle for stock jobbing.

North of the Bartlett is located the Reeves-Dobie, which had the finest surface showings in the camp. Last winter 62 tons of ore were shipped, extracted largely from open cuts near the surface, and several tons are now bagged up awaiting shipment next winter. Besides the original showings, many new surface finds have been made and the stripping has proved a dozen veins in a width of 300 feet lying parallel to each other and nearly all showing high grade ore shoots. The main shaft is now down 200 feet, and a crosscut has been started to intercept these veins, and should they prove strong at this depth the future of the property will be assured for some time to come. At another point several calcite veins close together and all carrying a little silver give a body of ore 12 feet wide and said to average close to 100 ounces in silver. This has been developed to a depth of 80 feet and the management are so well satisfied with the quantity and grade of ore shown that they have ordered a small mill consisting of a crusher, four Nissen stamps and Wilfley tables, and this equipment is now on its way to the mine.



Power Plant Reeves-Dobie Mine

The Reeves-Dobie veins extend over into the Welsh claims, where active development is in progress. Two shafts are now down about 50 feet on different veins and both show some silver in the bottom. Moreover, an adit crosscut is being driven from the hillside to cut through all the principal veins at a depth of 120 to 160 feet. This has now a length of some 250 feet; but when completed will be over 1,200 feet long and will join with both the shafts.

A mile north of these properties the Mann mine is working. The spectacular hillside silver shoot which used to be one of the sights of Gowganda is no longer to be seen. At this particular point the production was most disappointing, for the rich ore only extended down a few feet below the outcrop. However, several other good finds have been made on this property, and from one of the veins good ore is now being taken at the 90-foot level, while upwards of $20,000 worth of high grade material is in the ore house and several hundred tons of mill rock are on the dumps.

Just west of the Mann the Boyd-Gordon has done ex-

Erecting Power Plant, April, 1909

tensive development work with a shaft 125 feet deep and some 500 feet of crosscutting and drifting. This property shipped 35 tons of ore last winter. Work was suspended for a time this spring and summer, but the mine is now operating again and should contribute to next winter's ore shipments.

East of the Mann the LaBrick Company began active developments this summer and are sinking a shaft on a strong calcite vein carrying smaltite and niccolite.

Further north again, several properties are carrying on developments, notably the Bishop and Trans-continental. The surface showings were fairly good, but the underground work has not progressed far enough to prove or disprove the existence of workable ore bodies.

All the producing veins in the Gowganda ridge are of practically the same type. They are narrow fissures in the diabase with little or no evidence of faulting. The width varies from one to three inches and on the surface the veins are traced from 50 to 500 feet, showing calcite throughout their entire length. Cobalt bloom is often found for a good part of the distance, and the silver ore shoots are comparatively short, from 10 to 50 feet in length, though sometimes more than one ore shoot will occur on the same vein. The silver occurs native with calcite and occasionally as argentite or ruby silver, nearly always accompanied by cobalt and nickel minerals, but conversely silver does not by any means always accompany cobalt and nickel, though it can fairly be said that the cobalt is a good indicator for its occurrence. Other minerals found in the veins are bismuth, galena, graphite, specular iron and copper pyrites. These have no commercial value, nor can the presence of any of them be called especially favourable to the discovery of silver.

There are also several strong fault fissure veins on the ridge filled with calcite and from one to six feet in width. Cobalt minerals are found in places in these veins and low silver assays are reported, but in this section no mining has yet been done on them.

Four miles east of the Gowganda Lake mines lies the Miller Lake group of properties. The veins in this section present more variety than those in the "Ridge," and the development work is just now being carried on more vigorously than in any other part of the camp.

South of Miller Lake, properties have been developed by two syndicates at LeRoy Lake (one closed down temporarily), and by the Canadian-Gowganda and Northern Mining Company (Morrison Claim).

The developments at the two last named have been encouraging. The Canadian-Gowganda is down 100 feet and several veins have been crosscut on both the 58 and 100-foot levels. From the 58-foot level a little ore was produced by the development work and, if work is carried on steadily, the mine should ship next winter.

Loading Ore Shipment on Montreal River Steamer at Elk Lake

Mann Mine Trenching, Showing Surface of Typical Vein

On the Morrison property developments only started in July and two shafts are being sunk on a strong calcite vein having a width of three to eight feet and traced on the surface for one-third of a mile. There is silver in both these shafts, the high grade ore being confined to a width of four inches. Elsewhere the calcite contains copper and iron pyrites, galena, bismuth, smaltite and niccolite. Two other veins which intersect the main lead show silver on the surface, and the outlook of this prospect would seem exceptionally promising.

Just north of Miller Lake is the Gates, or Big Six mine, belonging to Mr. M. J. O'Brien. This property has been vigorously developed ever since March, 1909, and last winter eleven tons of ore were shipped. The values were pockety in the vein above the 50-foot level; but a marked improvement took place at that depth, and on the 90-foot level the ore shoot is 116 feet long, averages rather better than two inches wide, and the ore assays close to 4,000 ounces in silver. A car load of very high-grade ore has been extracted this summer and will probably be shipped at once.* The ore has every appearance of going down strong, and if another level proves it up equally good, this mine will be a steady shipper. At the present time I think it has the best underground showing in diabase in the camp.

North of the Gates is the Millerett which has shipped 305 tons of high-grade and medium-grade ore. This property, formerly known as the Blackburn claim, has 42 1-2 acres, on which Keewatin, conglomerate and diabase are found. There are some nice surface showings in the diabase and they are being developed at the present time, but so far almost all the production has come from one strong vein in the conglomerate. The high-grade ore

* Editor's Note.—This car has already been shipped and smelted. The returns were exceedingly satisfactory.

showed on the surface for a length of only 20 feet, but an adit level run in from the hillside under a back of 50 feet proved the ore to have a length of 150 feet, and this shoot has now been developed continuously to a depth of 180 feet below the surface and excellent ore is being taken from the lowest level. The width of the vein varies from one to four inches and the high grade ore so far has assayed 3,500 ounces. On each side of the vein for two feet the wall rock is well shot with silver and a large tonnage of good milling rock is on the dump and developed in the mine. To treat this it will probably seem advisable to erect a concentrator this winter.

It should be said that there is a great deal of similar Huronian conglomerate in the Gowganda district, and it appears to warrant more careful prospecting than has yet been accorded to it, for it would be very strange if this formation, which is responsible for 80 per cent. of the producing veins at Cobalt, should carry only this one Millerett vein at Gowganda.

The Bonsall mines adjoin the Millerett on the north and west and development is also in progress on this property. Four tons of high-grade ore was shipped by this company during the summer and ore is being mined at the bottom of a shaft now 66 feet deep.

Northeast of the Bonsall a strike has recently been made on the property of the Everett Lake Company and good ore is being sacked up from a surface opencut 70 feet long.

Something over a year ago the Canadian Mining Journal expressed the opinion that Gowganda was a camp well worth prospecting and development. I think this has proved to be the case. The prospecting is still going on and new veins found this summer are quite as promising as any of the original discoveries. The development is progressing and some of it is serving to block out reserves of rich ore, while a small but steady ore production is being made by at least ten different mines, all of which should make shipments this coming winter. The development has proved that it takes both time and money to put a mine on a producing basis at Gowganda and the money has to be put into the ground and not spent in advertising or head office expenses. It has proved that the ore lies in shoots or lenses of irregular length and depth, and in width rarely exceeding two or three inches. These shoots sometimes pinch out into blank calcite, but just as suddenly another good shoot will appear below or further along the same level. The shoots generally pitch in the veins, sometimes at quite a flat angle, and it is this which has caused many shafts to pass through the good ore at a depth of from 20 to 60 feet and often the ore will be picked up in the drifts.

At first Gowganda was looked at solely from the standpoint of a high-grade camp. This is a mistake. A very considerable quantity of milling ore, assaying from 30 to 100 ounces per ton in silver, is now being developed. It is all very nice to mine ore worth $1,000 or more per ton, but the occurrences of such ore are irregular, the veins extremely narrow, the quantity is sure to be limited, and the working costs very high, for, obviously, we must handle four feet width of waste rock to get the one or two inches of bonanza vein matter. It has become a pretty well established rule in all mining camps that in the long run the low grade mines are the biggest dividend payers, and I believe that the greater part of Gowganda production will eventually come from mills treating the comparatively low-grade rock which is really first-class concentrating ore.

So far it cannot be said that any very large mines have been developed at Gowganda, nor, indeed, has the development proceeded far enough to make any definite forecast as to the future of the camp; but from present appearances there are pay veins in the district. There are properties that can make a steady and profitable production and that in another year will deserve to be classed as good little mines, and Gowganda may hope to hold its present place after Cobalt, but a long way after Cobalt, as the second silver producer of Ontario.

THE NICKEL INDUSTRY.

(From Engineering Supplement, London Times.)

The world's production of nickel, which showed a marked increase during the years subsequent to 1900, has for the last few years remained fairly constant. The demand has been steady, but there seems very little doubt that it would have been much greater had the metal been obtainable at a slightly lower price. The price has been high chiefly through the instrumentality of the International Nickel Company, which has controlled prices in America and has succeeded in influencing outside markets as well.

The properties of nickel in itself are such that it will always command a wide sphere of utility. Its resistance to the attack of alkalis, the difficulty with which it is corroded by most acids, its durability, and the high polish it is capable of taking place it high amongst the commoner metals. It is these properties which have led to its adoption for such purposes as field and ship cooking utensils and for replacing copper as coinage, while it has long been used for electro-plating, and in this respect is little inferior to silver, while obtainable at a much smaller cost.

Nickel will alloy with most of the useful metals. Among such alloys the so-called German silver, which consists essentially of nickel, copper and zinc, is most widely known. The most valuable properties of German silver are its white colour, its brilliant lustre, hardness, tenacity, toughness, malleability, ductility, and power of resistance to many chemical influences. The presence of cobalt does not seem to interfere with these properties. A new alloy known as monel metal, which consists of one part copper and three parts nickel, with a small amount of incidental impurities, has many excellent properties, chief of which is its great resistance to the attack of acids.

It is the combination known as nickel steel, however, which utilizes most of the nickel mined at the present day. Nickel steel is principally used for armour plates, but the toughness of this alloy or mixture renders it also applicable for other purposes. Recent tests have shown its utility for rails and for rivets, and it has been adopted for the barrels of small arms. The presenec of nickel, up to 20 per cent., in steel increases the elastic limit and breaking stress, and steels rich in nickel are practically non-corrodible. Alloys have been made containing a high percentage of nickel, but it has been found that for general purposes, taking into account the relatively high price of the metal (at present about £160 a ton), the best result is obtained with the greatest economy when it is present to the extent of about 2 per cent.

Until quite recently the entire nickel supply of the world was obtained either from the Sudbury district of Ontario, Canada, or from the ores of New Caledonia. The other sources are still insignificant compared to these, but there is a possibility of great developments in the near future. About 60 per cent. of the world's nickel supply is mined at the present time in the Sudbury district. As early as 1770 Canada's deposits in Algoma, which borders on Sudbury, were worked as a

source of copper; but the true nature of the deposits was not recognized till in recent times the officers of the Canadian Geological Survey pointed out that they would probably be workable. The Sudbury deposits first attracted notice in 1883, during the construction of the Canadian Pacific Railway, and in 1886 they were first exploited for nickel. The ore in this district is mined and treated by two companies—the Canadian Copper Company and the Mond Nickel Company. A new company, the Diamond Nickel Copper Company, has started operations in the Northern range. The ore of the Canadian Copper Company is chiefly raised from the Creighton mine, which is rich in nickel, while the Mond Nickel Company obtains its supply principally from the Victoria mines. The ore is smelted into a matte by the Bessemer process, and this matte, which contains about 40 per cent. of nickel and about the same amount of copper, is then shipped for the production of pure nickel, by the former to Constable Hook, Nova Scotia and other places, and by the latter to South Wales. The ores from the Cobalt district, worked for their high silver content, give the only other supply from Canada, but in this case the metal is only a by-product, and the nickel content is not reckoned with in the sales. There are indications of workable deposits further north in Canada. Returns for the nickel industry of Ontario in 1908 give the following figures: Ore raised, 409,551 short tons; ore smelted, 360,180 tons; Bessemer matte produced, 21,197 tons; nickel contents, 9,572 tons; copper contents, 7,503 tons. The ore also contains considerable amounts of silver, palladium, platinum and gold.

All the ore in New Caledonia is exported to France, Great Britain and Germany for smelting, although plans have often been discussed for treating the ore on the island. In Great Britain the ore is treated by the Glasgow Nickel Company at Kirkintilloch. The approximate output of nickel ores from New Caledonia during the year 1909 was 120,000 tons.

There are now two other countries which produce nickel. In Norway it is worked in the valley of Sotersdalen, not far from Christiansund. The output in 1908 was only 81 tons, but has now probably much increased. Nickel was produced in the United States for the first time from its own ores in 1908, by the North American Lead Company, but the production was small. The Orford Copper Company and the Balbach Refining Company refine nickel, but obtain their supplies from the Bessemerized matte from Sudbury or from other sources. A deposit of ore somewhat resembling the Sudbury ore has been found in Nevada, but has not been worked. Particulars of a recent development at Webster, Jackson County, North Carolina, were given lately. Dr. Hennig has worked out a process for direct reduction in the electric furnace of a nickel silicate ore found there. A product consisting of silicides of nickel and iron with some chromium, aluminium, magnesium and a little carbon is obtained, which can be applied directly to the manufacture of nickel steel. The production of ferro-nickel, nickel alloys, and metallic nickel is also contemplated.

For refining nickel, or obtaining the metal from a nickel-copper matte, various processes have been adopted. The preparation of nickel oxide and direct chemical reduction gives an impure product as a rule. Formerly commercial nickel only contained about 94 per cent. of the metal, but in the last few years the commercial metal has greatly risen in purity. An analysis of one of the best makes of nickel would give figures of the following order: Nickel, 99.1 per cent.; cobalt, 0.4 per cent.; iron, 0.3 per cent.; carbon, 0.05 per cent.; manganese, 0.05 per cent.; silicon, 0.10 per cent. These figures, and the nature of the elements present as impurities, of course vary according to the nature of the ore and the methods adopted in refining it. In the United States, since 1894, electrolytic methods have been largely employed. Copper is deposited apart from the nickel in the actual electrolysis. Nickel is almost invariably deposited from solutions which have been made alkaline by the addition of ammonia, copper having been eliminated in a previous operation. In Germany, at the Papenburg works of the Aligemeine Electro-Metallurgische Gesellschaft, an electrolytic process known as the Hoepfner process has been adopted. In America the chief processes which have been tried or adopted are the Thum process at the Balbach Company's works, Newark, the process of the Orford Copper Company at Bayonne, New Jersey; the Brown process at Cleveland, Ohio, by the Canadian Copper Company, and the Hybinette process at Sault Ste. Marie.

The process adopted by the Mond Nickel Company at their Clydach works in South Wales is unique not only in the manufacture of nickel, but in the whole domain of metallurgy. The method adopted gives nickel of a very high degree of purity, seldom less than 99.9 per cent., the small trace of foreign elements left being carbon and iron. The Mond process depends on the formation of an easily volatile compound formed by the action of carbon monoxide gas on finely-divided nickel. This compound, known as nickel carbonyl, is easily decomposed by heat, leaving pure nickel, with the evolution of carbon monoxide, which is used again to act on further impure metal. The discovery of the formation of this compound, which was originally accidental, led to a patent being taken out in 1890 by the late Dr. Ludwig Mond for refining nickel, but it was not until 10 years later that it was used on the commercial scale. Since no other element present under ordinary conditions, with the exception of iron to a very limited extent, forms a carbonyl, the nickel is free from other metals, and especially from cobalt, which is separated only with extreme difficulty in other methods of refining. The metal appears on the market in the form of pellets varying in size up to 5-16-inch in diameter. The works at present turn out about 1,800 tons of nickel a year, but are being much enlarged.

The future production of nickel, at any rate in so far as it will be used for the manufacture of nickel steel, will, it seems, lie in the formation of ferro-nickel by direct reduction in the electric furnace, and with cheap electric power, and by working possibly some of the sources of nickel not yet tapped, it seems probable that the price may be considerably reduced. But in such a complicated problem as is afforded by the addition of various alloys to steel, it is difficult to see what the future may have in store. There are indications that vanadium and chromium, if the former can be obtained sufficiently cheaply, may replace the use of nickel; but, whether or not it is superseded as a toughening addition to steel, the fact remains that pure nickel, by reason of its excellent properties as a metal, must always find its uses, and the extent to which it is employed will depend on its cost.

Out of a group of 23 British iron and steel companies whose reports are lately to hand, 17 paid dividends during the past fiscal year, and 6 paid none. Dividends ranged from 1 1-4 per cent. to as high as 30 per cent. Six of the companies paid 10 per cent. or more. 16 companies showed larger cash reserves.

ELEVENTH INTERNATIONAL GEOLOGICAL CONGRESS, SWEDEN, 1910

By Dr. W. G. Miller.

(Written for the Canadian Mining Journal.)

The International Geological Congress meets at intervals of three or four years. In 1906 the congress was held in Mexico and in 1903 in Austria. Meetings in earlier years were held in Russia, France, and other countries. The eleventh, or 1910, congress met in Sweden. At this congress, following the custom of preceding ones, there were geological excursions both before and after the sessions, together with short ones from Stockholm during the sessions.

Parliament Buildings Stockholm, Headquarters of Congress

Before the sessions, which were held during the period August 17th to 25th, one had the choice of eight excursions, the two longest of which began in July and lasted for about three weeks. The excursions were numbered A1 to A8 respectively, and were arranged with the object of illustrating special branches of geology as exemplified in Sweden. For instance, excursion A.1 was to Spitzbergen. In order to show the object of this excursion one cannot do better than quote from the excellent guide book written for the excursionists by De Geer, the distinguished leader of the party: "When it was determined that the International Geological Congress should meet in Sweden, it was but natural to arrange a geological excursion to Spitzbergen, a land, which, owing to the numerous Swedish expeditions, has been called a Swedish scientific conquest. On Spitzbergen the different geological systems are more fully represented than in any other land in the polar region.

"This together with its geographical position gives to Spitzbergen a special geological interest, that land being situated just where the great continents of the eastern and western hemispheres most closely approach one another, thus giving a chance for more reliable time-correlations than is possible by palaeontological evidence alone when applied to far distant localities on different sides of the great oceans.

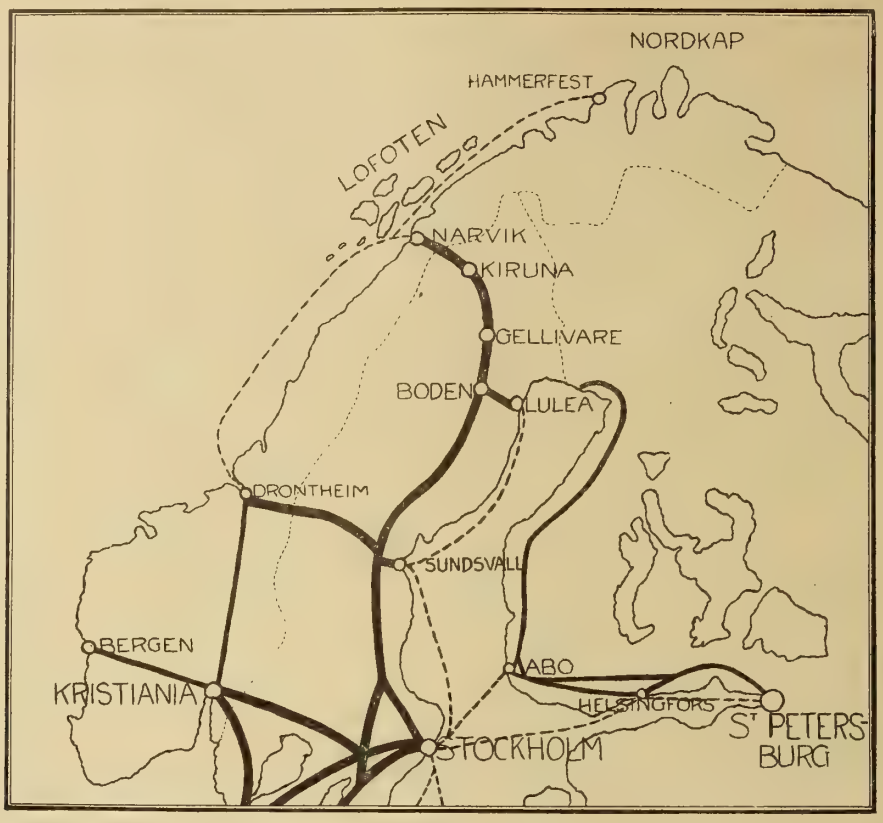
"Furthermore, Spitzbergen forms a part of the same continental plateau as Fennoscandia, and affords valuable information about the evolution of Scandinavia and the adjoining oceanic depression even during periods which are not represented on the peninsula in question.

"Last, but not least, Spitzbergen affords excellent opportunities for comparative studies of glacial conditions and glacial organisms, the knowledge of which is so necessary for the closer study of such a land as Sweden, being essentially characterized by its former glaciation. It has, indeed, become almost indispensable for Swedish scientists now and then to revisit the Arctic region where it is best accessible, or in Spitzbergen, in order to get the right explanation of such new questions as always arise with the development of science."

Spitzbergen is "no man's land," being under the jurisdiction of no country. Several nations are casting covetous glances towards it, now that a United States company has put the coal deposits on a commercial basis. This coal, by the way, came in very opportunely for the excursion steamer this summer. She ran aground and her supply of coal had to be thrown overboard. After being floated a supply of Spitzbergen coal was secured and proved to be of good quality. Had it not been for the enterprise of the American miners, distinguished geologists of several nations might still be lingering in the chilly atmosphere of the far north. This coaling station, it may be added, disturbs the naval plans of several nations. A supply of fuel for warships is now available from a new quarter.

I shall not, however, say more of the perils and pleasures of the Spitzbergen excursion, although I heard much of them from members of the party on their return to Stockholm, but suggest to the Editor of the Journal that he try to induce Prof. A. P. Coleman, of the University of Toronto, who accompanied the excursion, to write a paper and illustrate it with some of those excellent sketches he made of icebergs, fiords and mountains during the trip.

Excursion to Norrland and Lappland.



Excursion A.2, which the writer had the good fortune to accompany, left Stockholm on July 27th and returned on August 17th. The object of the excursion was to study "the structural geology and eruptive rocks of Norrland together with the iron ore deposits of Lappland." The route we followed to the north is shown in the accompanying sketch map.

The train was left at Sendsvall and an excursion of a few days' duration was made by boat to Alno and other islands along the coast. After leaving Kiruna we proceeded to the port of Narvils. Thence by boat south along the Norwegian coast to Trondhjem, whence we took train to Stockholm.

We were fortunate in having such an interesting route chosen for the excursion, and we were doubly fortunate in having such good men as leaders. From the day of departure until August 7th, Prof. A. G. Högbom was our "guide, philosopher, and friend." Earnest, enthusiastic, kindly, and conscientious, he captivated us all. The geology of his native country is a serious subject with him. Dilettantism has no place in his make up. What a great theologian he would have made in the olden days!

The first six days of the trip were devoted to a study of thrust planes, pre-Cambrian and other series of rocks, together with an ascension of one of the popular mountains of Sweden, Areskutan.

The next five days were given to "the eruptives of Ragunda, Alno, Rodo and Nordingara," famous locali-

Itinerary Map

ties. We all heard of them in our student days. One gets curious preconceived ideas not only of men but of places. I had always thought of the Isle of Alno as having "a storm- and rock-bound coast"—probably the study of thin sections of alnoite under the microscope had something to do with it—but we found it to be a smiling isle "where every prospect pleases." Our visit was in haying time, and, after looking at outcrops of remarkable rocks, alnoite and various nepheline and olivine-holding types, together with what is said to be eruptive limestone at the seashore, we tramped across country through sweet-smelling meadows and over park-like hillsides, viewing outcrops of various facies of the eruptive rocks, among which was calcite pegmatite. Then we had luncheon beautifully served on a lawn which "scorned Arcadian pride." I, at least, departed from the isle with my preconceived impression of it entirely gone. Alnoite will mean more to me hereafter.

Gellivare and Kiruna.

Having finished the second section of the trip we proceeded northward in order to visit the great iron deposits of Lappland—"les grands gisements de fer de Gellivare et de Kiirunavarra-Luossavarra, leur rapport avec les roches encaissantes." Our leader in the study of these iron deposits was Hjalmar Lundbohm, "directeur des mines de Kiirunavarra et Gellivare." What shall I say of Lundbohm? He possesses social qualities that would make him a desirable member of the Canadian Mining Institute. Need I say more? I wish Sweden were not so far away. We should have him at some of our annual meetings. That Scotch set—the Major, the Colonel, the late ex-Treasurer et al—would find that there are others.

Mr. Lundbohm has accomplished much for the mineral industry. He is given the credit of having done most to make iron mining at Kiruna and Gellivare the great success it has become. Early attempts at iron ore mining in these northern latitudes were not very successful. It was a question of waiting for the man. A former member of the Geological Survey, he saw the great opportunity there was for developing an industry that would be of great benefit to his country. He took hold of the mines when they were almost at a standstill. The government, although subjected to much criticism, built a railway through the barren region of Lappland and to the seacoast, where a harbour has been developed for the shipment of the ores at Narvik. Shares in the company controlling the mines are now selling at about five times their par value. In a short time the mines at Kiruna will be models for the world.

In addition to his work in mining, Lundbohm takes an active interest in all things that tend to the advancement of his country. He is a close student of technical education problems and is providing educational facilities both for the workmen and for the boys and girls of his mining towns. He is also an intelligent student of political conditions in general.

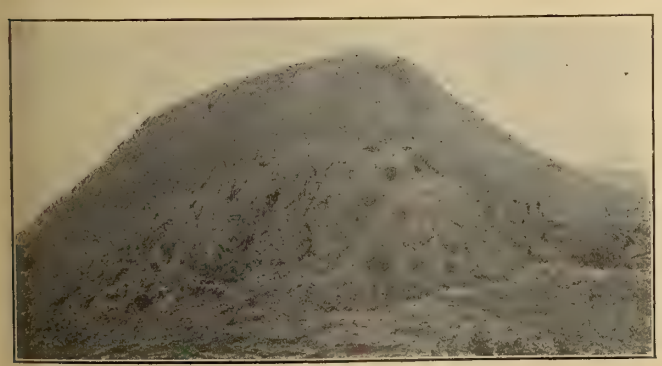
The iron deposits at Kiruna can be classed among the great ore bodies of the world. The following notes on the Kiruna district are taken from Lundbohm's guidebook, prepared for the excursionists:—

Iron Mines at Kiruna.

"About the geology of the country around the gigantic iron ore deposit of Kiirunavaara very little has been known until interest was raised in utilizing the ore technically and commercially, and, in fact, until that time it was rather difficult to arrange systematic investigations in this desolated region. Besides, the proportions of the ore mountain have, so to say, paralyzed the interest of the geologists in everything else, most of them being fascinated by the richness accumulated in the ridge of the mountain. Very few devoted their studies to the remarkably interesting surroundings.

"The first accurate, and, indeed, very important and useful survey of the iron ore deposits and of the district, was executed in 1875 by a commission in charge of the

Geological Survey. Later on K. A. Fredholm collected some very interesting data, which were published. In 1896, Professor Helge Bäckström and the author of this paper started a thorough investigation and published a short description of the more essential geological and petrographical features of the district; in 1897 the author made a study of the deposits from a practical point of view for the government, and lately very important and extensive reports have been published by O. Stutzer and P. Geijer.



General View of Kiirunavaara Iron Ore Mountain

"The Kiirunavaara and Luossavaara iron ore fields are situated in Lappland, halfway between Torne River and Kalix River, about 90 miles north of the Polar circle, 186 miles from the port of Lulea at the Baltic Sea and 105 miles from Narvik at the Ofoten Fjord in Norway. Both these ports are connected by a railway, built for ore transport, but also connected with the railways of southern Sweden. The distance from Kiruna railway station to Stockholm is 876 miles.

"The preparatory work for the mining of the ore was started in 1898; in the following year, when the railway reached Kiruna, it could be continued on a large scale; in 1902 the railway was completed and prepared for extensive traffic, which commenced in 1903, when about 800,000 tons were exported.

"Kiruna is situated in a desolate country, quite uninhabited before mining was commenced, and only periodically visited by Laps, the nomadic tribes, that for many hundred years have been the only inhabitants of the district and still are numerous and comparatively prosperous.

"The climate is rather severe, the yearly average temperature being 29.3 degrees, and the winter, lasting from the beginning of October to the end of May, generally bringing huge masses of snow and very often a temperature of 4 to 31 degrees below zero. During one month, at Christmas time, the sun is below the horizon, but in the summer the midnight sun gives a bright illumination day and night.

Statsradstoppen Summit of Kiirunavaara Iron Or Mountain

"In the year 1900 the building of houses was started at the new place Kiruna, and since then a community has grown up, now containing about 7,800 inhabitants. From the central part of the town an electric railway is built for the workmen to the foot of Kiirunavaara, from where they are carried on an incline up to the mines.

"The iron ore mountain is on an elevated plateau consisting of vast moorlands and moraines. Several rather big, rounded, mountains and hills rise in the neighbourhood. The Kiirunavaara and Luossavaara are the highest, the former reaching a height of 2,453 feet above sea level and 853 feet above the flat valley between the two mountains. The whole district lies in the birch region and most of the tops rise above the tree limit.

"The ore mountains, forming the central part of the district, consist of igneous rocks, syenites, and porphyries, the ore lying in the latter, and this whole igneous district is bounded on both sides by sedimentary rocks. These are in the west a series of conglomerates, resting on more or less metamorphosed igneous rocks, temporarily called soda-greenstones, all grouped together under the name of the 'Kiirunavaara complex.' The series bounding the ore-bearing porphyry district in the east is called the 'Hauki complex,' after the hill Haukivaara. It consists of quartzites, conglomerates, phyllites, beds of igneous rocks and of a relatively thick formation of quartzitic sandstone. East of these rocks there is another area of ore-bearing porphyry.

The Iron Ore.

"In the area here described there occurs commercially valuable iron ore in Kiirunavaara, in the mountain ridge itself and in some minor deposits to the south-east of the great ore body, in Luossavaara as a comparatively large deposit commencing far down on the southern slope of the mountain, and extending across the top down upon the northern slope, and as a small deposit upon the eastern slope of the mountain, and finally in Tuolluvaara. There are, besides, minor deposits of low grade magnetic iron ore in a small area between the lakes Syvajarvi and Nokutusjarvi, and there appears numerous long but narrow strata of low grade hematite in the rocks of the Hanki complex.

"The Kiirunavaara ore deposit commences in Luossajarvi and continues towards the south, as far as is known, with a length of somewhat more than 5 kilometres (3 miles). The mountain ridge itself, with a length of about 3.5 kilometres (2 miles), consisting exclusively of iron ore, is divided into 11 more or less strongly marked hills. When the survey and mapping of the mountain was executed in 1875 by a commission appointed by the government, these hills were given names after the persons who in some way or other took part in the work.

"Although the iron ore generally is intersected by innumerable joints, it has resisted the erosion very much better than the surrounding rocks, which is the reason why the ore forms an elevated ridge in Kiirunavaara and a well marked top in Luossavaara. In the former mountain the ore dips to the east about 54 degrees. The hanging wall has been eroded more than the foot wall and for this reason we do not get the right width of the ore body by a direct measurement. It has, however, been possible to find the dimensions near the surface with the help of cross sections constructed according to the angles of dip found by diamond drillings.

"In the about 3,000 metres (10,000 feet) long mountain ridge, where the boundaries of the ore body are very well known, its horizontal width is on an average 96 metres (315 feet) and the thickness, at right angles to the hanging and foot walls, 78 metres (256 feet) ac-

cording to measurements made on 56 section-lines, taken 50 metres (164 feet) apart. There is no exception from the rule that the ore body is heavier in and around the highest tops and narrower in the lower parts of the ridge. The maximum thickness has been found in a cross section through the hill Geologen, where the horizontal width is 196 metres (643 feet) and the thickness about 164 metres (536 feet). In the highest peak, Stratsrädet, in a tunnel right across the ore body, 138 metres (453 feet) above the level of the lake, the horizontal width is 188 metres (617 feet). In the lowest parts of the ridge the width of the ore varies between 40 and 56 metres (131 and 184 feet).

"The horizontal area of the ore body, including the deposits south-east of the ridge as well as the deposits in the lake, has, by adding areas of horizontal sections, each of a length of 50 metres (164 feet), taken at the outcropping of the hanging wall, been calculated to be about 436,000 square metres (4,692,104 square feet).

"The question as to the depth which this deposit reaches is of equally great interest from a theoretical as from a practical point of view, but unfortunately we are lacking material for a safe estimate of the same. In order to obtain information as to the quantity and quality of the ore, a great number of diamond borings were made to a total length of nearly 6,000 metres (19,680 feet), and important conclusions may be drawn from the results of these borings.

"Below the level of the Lake Luossajärvi the boundary between the hanging wall and the ore is struck at eight different points of which three lay respectively 146.7, 205, and 236.7 metres under that level. The boundary between the ore and the foot wall has been struck at six points, of which two lay at a depth of 106.8 and 114.3 metres. The greatest known depth of the ore is in the claim Zenobia, where the drill hole finished in ore 300.6 metres below the lake, and thus 548 metres (1,797 feet) under the mountain's highest top. Here the ore must have a considerably greater breadth deep down than in daylight.

"The borings, as well as the mining, have proved that the dip of both the hanging wall and the foot wall is very variable, but, if the averages for all observations are calculated, it becomes practically equal. Thus these borings confirm the supposition first arrived at, that the walls of the ore body are very uneven and consequently that such variations in the thickness as occur in the surface also may occur in the vertical direction. In other words, we must not from the incidental decrease in thickness draw the conclusion that the ore rapidly wedges out. On the contrary there seems to be a very strong reason to believe that the ore body continues to a great depth, an assumption which has been strongly confirmed by the survey of Carlheim Gyllenshold.

Luossavaara Ore Deposit.

"The ore deposit in Luossavaara, which is quite separated from that of Kiirunavaara, has a length of about 1,200 metres (3,936 feet) and reaches its greatest width at about 50 metres (164 feet) in the top of the mountain. The ore dips about 65 to 70 degrees east. Those diamond borings, which have hitherto been carried out, indicate a decrease in thickness of the ore body in depth.

"In the hill Tuolluvaara there are a number of ore deposits scattered round. The largest of them has a horizontal width of up to 30 metres, and dips about 60 degrees southeast. The horizontal area of the outcrop of all the more valuable ore bodies has been estimated to be about 14,800 square metres (159,307 square feet). According to the results of some deep drill holes, the largest should wedge out 230 metres (754 feet) below the surface, but there are strong reasons to believe that it has a pitch to the southwest and probably continues to a greater depth.

Character of the Ore.

"Another more interesting peculiarity is the richness of the ore. The ore, consisting almost exclusively of magnetite, is remarkably free from all non-metallic constituents, except apatite. Hematite occurs intermixed to a larger extent in the hill Professorn and in some parts of Luossavaara; as small, irregular lumps, crystals and very numerous thin crack-fillings in the magnetite, the mineral is found everywhere, but perhaps most commonly in the hills Geologen, Bergmastaren and Kapten in Kiirunavaara; and also in Tuolluvaara.

"Among other minerals, occurring sparingly, may be mentioned pyroxene and uralite, tourmaline, talc, and asbestos. Calcite and pyrite are rather common in cracks at greater depths, especially in the hill Professorn; rutile is found in thin sections of very pure magnetite in the hill Vaktmastaren, and titanite as idiomorphic crystals in the ore, for instance in the southernmost hill Jagmastaren and more commonly in Luossavaara . The amount of titanic acid in the ores is generally not as much as 0.5 per cent., the sulphur percentage averages 0.05 or less.

"Apatite is also present, but in the most varying proportions. In the northernmost hill, Vakmastaren, now mostly quarried out, and also in the most southern hills, Porfessorn and Jagmastaren, there is ore with as little as 0.16 per cent. of apatite in such quantities as to permit mining on a large scale. In the intermediate parts of the mountain the percentage of phosphorus is generally high, sometimes rising to 4 or 5, corresponding to 21.6 to 27 per cent. of apatite. Even the mode of occurrence is very variable. Sometimes the mineral in large quantities is so finely disseminated in the magnetite that it cannot be discovered without the microscope. At other times it is found as smaller grains, as fine veins or filling of cracks, or as irregularly formed masses, in many cases bed-like, up to 0.3 metres in width and 10 to 15 metres in length.

"In some parts of the Kiirunavaara wedge and especially near the foot wall in the hills Statsradet, Geologen, and Kapten, the ore is laminated and consists of very thin layers of apatite alternating with thin sheets of iron ore. This produces a remarkably fine stratified structure, which no doubt is one reason why some geologists have made up their minds that the ore body must be of sedimentary origin.

"In other cases the structure of the apatite masses more resembles that of ordinary mineral dikes.

Reindeer.

"The ore in Kiirunavaara and Luossavaara is always extremely compact and hard and shows microscopically in general no crystalline texture. The Tuolluvaara ore has a fine-grained crystalline structure. In the first-named mountains, but especially in Kiirunavaara, there is a very conspicuous jointing, which has the effect that the ore, when blasted, splits in small, often rhomboid-like pieces."

In order to show the chemical composition of the ore, some representative analyses are given below:

	1	2	3	4	5	6	7
Fe_3O_4	76.01	91.50	65.31	96.10	68.73	89.39	90.05

MnO	0.93	0.20	0.15	0.13	0.22	0.12	0.12
MgO	0.75	1.45	1.15	0.62	0.54	1.94	1.83
CaO	8.92	2.22	14.04	0.60	0.60	0.81	0.42
Al_2O_3	0.79	0.81	1.26	0.20	1.38	0.48	0.34
TiO_2	0.13	0.21	0.05	0.50	0.30	0.17	0.11
SiO_2	1.80	1.74	1.04	1.02	1.94	3.66	2.14
P_2O_5	6.713	1.28	10.97	0.016	0.122	0.19	0.016
S	0.050	0.018	0.036	0.026	0.014	0.045	0.059
Total	100.673	100.368	99.836	99.972	100.172	99.655	99.685
Fe	58.25	66.92	51.37	70.12	68.20	66.72	68.43
P	2.931	0.561	4.789	0.007	0.053	0.085	0.007

Analyses 1-4 are of Kiirunavaara ore, 5 of Luossavaara, and 6 and 7 of Tuolluvaara.

Origin of the Ores.

"The question of the genesis of these enormous iron ore deposits naturally has attracted the attention of geologists. The theories expressed essentially follow two lines: the pneumatolytic-hydrothermal, proposed by Bäckström, 1898, and supported by De Launay in 1903; and the magmatic, first suggested by Hogbom and defended by Stutzer and lastly by Geijer."

The Gellivare Iron Mountain.

The ore bodies of Gellivare, while smaller than those of Kiruna, are of large size, as will be seen from the following notes taken from Prof. Hogbom's guide book on "The Gellivare Iron Mountain":

"All the economically important iron ores occurring in Lappland are enclosed in syenitic rocks, which occupy a considerable area extending from the vicinity of Lake Torne Trask in the north to Gellivare in the south. Besides the syenitic rocks a number of granite and gabbro massives play an essential part in the composition of this area. Furthermore, dikes of granites, pegmatites and basic rocks are very common, and here and there sedimentary complexes appear as scattered remnants, pressed down in the syenite rocks.

"The iron ore field of Gellivare is located in a zone of syenitic rocks which may be regarded as a southern ramification from the north Lapponian syenitic area. In the south this zone is bounded by a gabbro massive forming the conspicuous Gellivare Dundret. To the northwest a granite area (the Linaalf massive), and to the north a complex of quartzites, amphibolites and mica schists (Nautanen schists) bound this syenitic belt. In the midst of the same the mountain Malmberget ('the Ore Mountain') rises, surrounded on all sides by moraine and swamp covered lowlands, under which the contacts between the syenitic rocks and the adjacent rocks just mentioned are hidden.

"The ore deposits of Gellivare are all situated in this mountain, which therefore rightly has been named the Malmberget.

"The Malmberget rises with its highest point, Walkomman, 616 metres (2,020 feet) above the sea, or about 300 metres (984 feet) above the surrounding lowlands. The summit of Walkomman is covered by birch woods and reaches beyond the pine forest boundary which runs on a level of about 540-550 metres (1,800 feet). Even the eastern part of the mountain, the Kungsryggen, with a maximum height of 580 metres (1,900 feet), reaches a little beyond the same forest boundary. The mountain extends east and west and has a length of 6 kilometres (3.7 miles). Two lower offshoots are directed to the south, the Kaptenshojden branching out from the Kungsryggen and Parvavaara from the Walkomman.

"The main ore belt, with a length of about 4 kilometres (2.5 miles) from Walkomman in the west to Tingvalls Kulle in the east, following in the western part the southern slopes of the mountain, where it is marked by a series of mines and dumps, easily visible when approaching Malmberget with a train from Gellivare. The eastern part of this ore belt runs on the northern side of the Kungsryggen and cannot be seen from the south. The mines situated on the eastern slopes are likewise not visible from this side. A group of mines is situated on the southern slope of the Kaptenshojden and attract the attention when the train approaches the station of Malmberget."

Historical Notes—Production.

"The first accounts of the iron ore of Gellivare date from the beginning of the eighteenth century, and already in the middle of the same century mining and iron production on a small scale had been tried. The ore was transported by reindeer to some small blast furnaces in the neighbourhood. Later on (1799-1810) the eminent scientist and patriot, S. G. Hermelin, who was in many ways a pioneer for the colonization of this remote country, made energetic, but quite fruitless, attempts to start an iron industry on a greater scale. After the Hermelin period the mines changed hands many times and considerable capital was consumed, but, because of the high percentage of phosphorus and also because of lack of communication, the output was insignificant and the work was repeatedly stopped. It was not until the invention of the 'Thomas method' and the building of the Gellivare-Lulea railway (1888) that a new era began for this great Lapponian ore field. Since 1903 the main part of the same has been in the hands of the Trafikaktiebolaget Grangesberg-Oxelosund, which also works the mines of Kiruna and Grangesberg. Since 1907 the Government has been a partner in the association, and, by a contract, in force until 1933 (eventually 1938), the production of ore for export is fixed at 18.75 (or 22.50 to 1938) million tons, distributed over the period 1907-1933 (1938).

"The shipping harbour for the Gellivare ore is Lulea and the export goes chiefly to Westphalia (via Rotterdam) and to Silesia (via Stettin); a minor part goes to England, America and other countries.

"Besides the Grangesberg Company, another company, Bergverksaktiebolaget Feeja (since 1898) works a mine

in the Gellivare ore field, viz.: the Koskull Kulle mine, with an annual production at present of about 200,000 tons, which is exported to Witkowitz (Austria).

"The total annual output of the Gellivare ore field averages at present 1.2 million tons, and the hitherto exported quantity reaches about 16 million tons. For the Swedish iron industry, which is chiefly based on iron ores with low percentage of phosphorus, the Gellivare ores have only been used to a very small extent. A furnace at Karlsvik, near Lulea, produces some ten thousand tons of iron from the Gellivare ore (magnetic separation, briquetting, by the Grondal method).

The Ores.

"The average chemical composition of the iron ore from this ore field appears from the analyses here given. The most striking features are the high percentage of iron, the low amount of intermixed silicates, and the variable, often rather high percentage of phosphorus. The figures are averages of considerable quantities of ore. A much higher percentage of phosphorus is found in more limited parts of an ore body, for instance up to 4 per cent. and more in the Walkomman ore; and, on the other hand, the ore may be here practically free from apatite and silicates and consist of almost pure magnetite.

"Mineralogically, as appears from the analyses, there can be distinguished several varieties of ores, according to the kind and amount of the intermixed minerals. With regard to the iron ores per se two types occur, the magnetite ores and specular hematite ores, of which the former are predominant. Intermediate forms between these types are also found, the ore minerals often being mixed; but, on the whole, the types are tolerably well separated. As to the distribution of the kinds of ore, there is no general rule. Sometimes the hematite ore is located in the hanging, sometimes in the foot wall of the magnetite, or it is enclosed in the same, or it forms independent bodies. The different modes of occurrence are illustrated by the Walkomman, Linne, Baron, Hermeline, Skäne, and Oskar mines. There are circumstances that indicate that the hematite or specular iron is secondarily formed from the magnetite; but whether that is always the case is doubtful. It can be said in favour of a secondary origin that the wall rock of the hematite is often somewhat decomposed, but there are also contacts, which show the same characteristics as the magnetite ore contacts."

Lapplander Church, Gillivare

	1	2	3
Fe_3O_4	94.70	78.84	75.29

P.	0.013	0.466	1.148

The analyses represent the average composition of some thousands of tons of ore from each of three mines.

The Ore Bodies.

"Most of the ore bodies have a roughly lenticular shape, and they are distributed over the field so as to form several ore-bearing belts.

"The ore supply has been estimated at 270,000,000 tons for the whole ore field, considering the depth to be 1,600 feet below the datum level of Walkomman, or 1,250 below the present average surface of the ores. The quantity, here, consequently, is only about a third of that of the ore deposit at Kiirunavaara.

"The shape, size and dip of the ore bodies have been decisive for the mining methods in practice. Hitherto, open-quarrying methods have been prevailingly used, but on account of the dip of the ores, these methods must at deeper levels be replaced by underground mining. If no regard is taken to the necessary removing of the hanging wall, the relative output of ore is essentially dependent on the intermixed dike rocks and varies in the different mines generally between 60 per cent. and 90 per cent. If the necessary blasting away of the hanging wall is also taken into consideration, the percentage of ore sinks considerably and does not for the field taken as a whole much exceed 55 per cent. of the total, nearly the half of which, consequently, consists of sterile rock and ore containing too little iron to be at present valuable."

. . . . . .

The Government is harnessing water falls in order to supply the railway and the mines with electric power. At first 50,000 h.p. is to be developed. A total of 300,000 h.p. can be developed if required. The railway will be operated by electric power for a distance of about 150 miles from the water falls. Railway operators in Canada, where conditions are so similar in many ways to those of Sweden, should be able to gain some useful information from this Swedish railway.

As stated above, iron ore from Kiruna and Gellivare is shipped to various countries, including the United States. A few years ago ore was shipped from Gellivare to Sydney, N.S., and coal cargoes were sent to Sweden in return.

It was interesting to see American machine drills in use at these mines. The ore trains carry just half the quantity those on the Mesabi range do.

The mining towns contain on the whole a better class of houses and are much cleaner than those in most North American mining fields. Everything considered, one is inclined to say that the miners in Northern Sweden are at least as well off as are their brethren in the better

class mining camps on this continent. Drill runners get about $2.00 a day, and ore-loaders about $1.50. Their expenses are, however, considerably lower than they would be in America. For instance, they pay, at Gellivare, only about one dollar a month rent for a house, but this is shortly to be raised to $3.50. Master-mechanics and other employees of similar standing who have served the company for 20 years or more are given a pension of $250 a year. Allowances are made to men who are incapacitated through injuries, and a system of insurance similar to that in Canadian mines is in force for the employees. The government inspector, I was told, visits the mines at Gellivare once a year.

Space has not permitted reference to many interesting points in connection with the geology, the ore bodies and the methods of mining at these great mines. Readers who wish details should consult the splendid volumes on "The Iron Resources of the World," edited and published by the Swedish committee of the Congress.

Kiruna to Narvik

During this stage of the excursion we had an opportunity of visiting very interesting geological localities, where we saw pre-Cambrian and later rocks, and one very striking thrust plane. This part of the trip, moreover, appealed to the members of the party owing to its being under Arctic conditions. The tree line came down to the railway in places, and the glacier-covered and snow-capped mountains, together with the more level treeless tracts, presented a scene which will long be remembered by the members of the party. Dawson City is south of latitude 64. The railway on which we travelled, the most northern in the world, passed through latitude about 68.50. At Narvik we were shown the town, which has been built up in a somewhat desolate region (though attractive in summer) in a few years owing to its being the shipping point for the ore from Kiruna. We visited the docks and saw the methods employed in sampling and loading the cargoes. By the way, some members of the party discovered that white bear skins were very cheap in Narvik and a number were purchased.

Railway in Lappland

While on the trip from Kiruna to Narvik we were under the leadership of Dr. P. J. Holmquist, another Swedish geologist for whose scientific attainments and personal qualities we had the highest respect and admiration.

Narvik to Trondhjem to Stockholm.

From Narvik we took a steamer down the coast of Norway to Trondhjem. I shall not attempt to describe the scenery of this coast. Its fiords, mountains, glaciers and islands together form one of the most celebrated regions of the world for the tourist, and it has been well described by many writers.

Leaving Trondhjem by train for Stockholm, we passed through an interesting country. Space, however, prevents my referring to this part of the journey, except to say that one town we passed through is famous among English-speaking travellers because its name is H——.

Lest what I have already written weary my readers, I shall close without describing the sessions in Stockholm or the excursions of the Congress. In another number of the JOURNAL I will take up these subjects.

Before closing, I wish to say that we were most favourably impressed with Sweden as a country and with its people. Canadians, especially, can learn much from Sweden as regards the industries of agriculture, mining

A Scene on the Coast of Norway

and forestry. It is also justly celebrated for its educational institutions.

At another time I hope to have the opportunity of expressing more fully in writing my high appreciation of the kindness shown to us, and of giving an account of the splendid organization the Swedish geologists had for the Congress.

The next Congress is to be held in Canada, on the invitation of the Dominion, the Province of Ontario, and the Canadian Mining Institute.

THE PREVENTION OF MINE EXPLOSIONS

(Continued from last issue)

Where current at a potential of more than 650 volts is employed for transmission underground, it should be transmitted by means of a completely insulated cable; and where a lead or armoured covering is used, such covering should be grounded.

In all mines having electric installation special precautions should be taken against the setting on fire of coal or timber. Enclosed fuses or cut-outs are recommended, and each branch heading should be so arranged that the current may be cut off when necessary.

No live electric wire should be permitted in that part of any mine in which gas is found to the amount of 2 per cent.

In all mines producing gas in dangerous quantities, as indicated by a safety lamp which will detect 2 per cent. of gas, the working places should be examined for gas by a qualified man, using such a lamp, immediately before any electric machine is taken or operated there.

H.—Precautions against Miscellaneous Accidents.

(1) In all new construction, shaft lining and superstructures about the entrance of the shaft (or slopes or drifts) should be built as far as practicable of non-combustible materials.

About the entrances to mines every possible precaution should be taken to prevent fires or the injury of the equipment for ventilation and haulage. Ventilating fans should be placed at one side of the mine opening, and hinged doors or light timbering should render easy the escape of the explosive force in direct line of the shaft or slope.

Proper precautions should be taken for immediately preventing the entrance into the mine of heat and gases and for facilitating the escape of the men in case of surface or shaft fires.

(2) The surface equipment for handling the coal should be so arranged as to prevent coal dust from entering the mine shaft.

(3) In all new mines, and in all old mines as far as practicable, suitable main roads should be provided for the men separate from the main haulage roads.

(4) In connection with the system of ventilation it is recommended that in the more frequented roads connecting the intake with the return air coures, two doors be provided, these doors to be placed at such a distance apart that while one is open the other is closed.

(5) In view of the large number of accidents from falls of coal or roof, under the existing practice with single props, more attention should be given to the introduction in mines where the roof is bad of better systems of timbering, such as have been long in use with economy and safety in many well managed mines.

(6) In undercutting coal by hand, the premature fall of the coal should be prevented by sprags or other suitable supports.

(7) We believe that the difficulties and dangers encountered in the working of coal seams which are thick and steeply pitching, or of which the coal is highly inflammable in character or subject to firing from spontaneous combustion, and in mines where the subsidence of the surface must be avoided, may be successfully and economically overcome in many cases through the adoption of the flushing system of mining—that is, the filling with sand or other similar materials of the space from which the coal is removed. This system originated in the United States and is now successfully practiced in portions of Germany, Austria, Belgium, and France.

I.—Mine Supervision and Inspection

(1) We cannot too strongly emphasize the fact that thorough discipline about the mine is absolutely essential to safety, and that thorough discipline can be brought about only through the hearty co-operation of the operators, the miners, and the State.

(2) We are of the opinion that the responsibility for safety in the mine should primarily rest with some person, such as the manager or superintendent, clothed with full authority; and that such person can greatly facilitate the attainment of safety through the employment of a sufficient number of foremen, and also of one or more inspectors whose special duty it shall be to see that the regulations are strictly enforced.

(3) The State cannot exercise too much care concerning the experience, technical training, and selection of its inspectors. Their positions should be made independent of all considerations other than that of efficiency; and their continuance in the service should be co-existent with good behaviour and proper discharge of official duty.

J.—Training for Mine Firemen, Inspectors, etc.

We are of the opinion that the cause of both safety and efficiency in coal-mining in the United States would be greatly aided through the establishment and maintenance in the different coal regions of special schools for the training of fire bosses, mine foreman, superintendents, and inspectors. The instruction in such schools should be practical rather than theoretical.

The work of these schools would supplement most effectively that of the colleges already established in many parts of the country for the more thorough training of mining engineers.

THE DOLCOATH'S NEW SHAFT

After many years' work, the new vertical shaft at the Dolcoath mine has been completed to a depth of 3,000 feet. This shaft is circular and is lined with bricks from top to bottom. The hauling and pumping arrangements have still better ventilation, which is much needed in the lower levels of the mine. The system of rail guides is being adopted in the shaft, on which two cages will run, and these cages are so designed that they will automatically tip the wagons each of 30 tons capacity, put in them. The making of connections to the Williams shaft entailed a great deal of work which interfered with returns. Perhaps in the course of many years this shaft may warrant the large expenditure, but it has been a tedious and costly undertaking more suited to a coal than a tin mine.

The practice of filling old stopes with sand is becoming more general. At one German colliery about 1,300 tons of sand per day is washed through iron pipes into the stopes. The wear on the pipes is enormous. White porcelain and glass linings have been tried. The former is the better, though both wear out within a few months. At one mine no lining is used, the pipes being patched by means of oxy-hydrogen flame.

THE BRIQUETTING OF IRON ORES

By Chevalier C. De Schwarz (Liège).

(Paper read before the Iron and Steel Institute.)

General Remarks.—The question of briquetting iron ore is one which becomes of increasing importance every year, not only owing to the fact that iron ore in general, and lump ore in particular, are becoming more and more scarce, at least in Europe, but also because of the severe conditions imposed by modern blast-furnaces; not only in regard to the chemical composition, but also to the physical condition of the ore.

The use of improved and more effective explosives in the iron mines, as well as the fact that iron ores have to be transported over long distances and frequently reloaded before they reach their destination, tend to increase the percentage of small and dust ore, to the disadvantage of blast-furnace working which—on account of the greater height of the furnaces themselves, the high pressure of blast, and the use of blast-furnace gases for gas engines—require an ore which is not too fine nor too dusty.

The blast, being of comparatively high pressure in modern blast-furnaces, will naturally blow out a considerable portion of the fine ore, which will mix with the escaping blast-furnace gases, causing well-known inconveniences. This is the more objectionable, as the blast-furnace gases are now, almost everywhere utilized for driving gas-engines, for which purpose the gas must be almost entirely free from dust.

The fine ore, during its downward passage in the blast-furnace, advances quicker than the lump ore, charged at the same time; consequently it is not exposed long enough to the beneficial reducing influence of the carbon monoxide gas arising from below. It therefore leaves the zone of reduction in the blast-furnace imperfectly freed from oxygen, and, as a consequence, clogs together as soon as it reaches the zone of carbonization, causing scaffolding, and even explosions.

A considerable number of methods for briquetting iron ore have been brought out, but none as yet that can be applied generally with success. A few of the methods introduced into practice have proved successful, but only for certain kinds of ore, or in local circumstances and conditions. Some methods which have yielded favourable results with a particular kind of ore, have entirely failed with other ores. Experience has also shown that the method to be adopted must be modified to suit the nature of the ore, not alone with reference to its physical condition, but more especially with regard to its chemical composition. Most of the different methods which have been tried for briquetting fine-grained ore have proved to be too expensive, not alone with reference to initial outlay and cost of manufacture, but also, indirectly, on account of the great reduction of the contents of iron in the ore which occurs owing to too great an addition of building material.

The conditions for successful briquetting are:

1. The iron ore briquettes must have a certain resistance against mechanical influences. They must resist a pressure of not less than 2,000 pounds per square inch, and, when dropped from a height of 10 feet on a cast-iron plate, they must not fall into dust although they may break into pieces.

2. They must resist heat. Heated to 900 degrees C. they may commence to sinter, but they must not disintegrate into small fragments.

3. They should be capable of being placed in water for a certain time without softening.

4. They must resist the influence of steam at 150 degrees C. without crumbling.

5. They must possess a certain amount of porosity in order to allow the carbon-monoxide in the blast-furnace to penetrate the interior of the briquette and to exercise its beneficial reducing influence.

In order to test the briquettes for porosity, they are, after being dried, placed for about twenty-five minutes in water, during which time they ought to absorb not less than 12 1-2 to 16 per cent. of water, according to the nature of the ore.

6. The binding medium, if any is used, should not contain noxious substances (sulphur, arsenic) to such an extent as to be injurious to the quality of the pig-iron produced.

7. The cost of producing briquettes should not exceed the difference in the prices between lump ore and fine ore.

The different systems of briquetting ore can be divided into those in which a binding medium is used and those in which no binding medium is used. The former may again be divided into methods employing inorganic and organic binding materials respectively.

Briquetting Without a Binding Medium.—In most of the cases, where no binding medium is used, the briquettes have to be heated at considerable expense, but there are exceptional cases where no heating is necessary notwithstanding that no binding medium is employed. This case presents itself where the iron ore contains a certain percentage of clay, because in such cases it contains in itself a binding medium. Clay iron ore and bean ore are instances.

At Kertsch, in Russia, where bean ore is briquetted, the latter is mixed with 8 per cent .of water and made into briquettes under a pressure of about 5,600 pounds per square inch. At Ilsede, in Germany, where clay iron ore is used, it is mixed with the waste of the iron ore washing plant and with other powdery waste products coming from the rolling mills and containing sufficient iron. The mixture, which is not allowed to contain more than 6 per cent. of water, is heated to about 75 degrees C. and pressed into briquettes, the pressure being about 4,000 pounds per square inch. In both the above cases no heating of the briquettes is necessary, and no binding medium is used.

The results obtained at Kertsch and at Ilsede naturally suggest the addition of common clay to other iron ores (containing no clay) as a binding medium in order to make briquettes by means of a cheap medium, and without going to the expense of heating the briquettes. However, it has been found that—in order to achieve the desired result—it is necessary to add a comparatively large percentage of the clay to the ore, thus indirectly reducing its contents of iron to too great an extent. Common clay contains, moreover, a high percentage of silica, requiring extra additions of limestone. The practice of using clay as a medium has therefore been abandoned, and it is only employed in cases where ferruginous clay is at disposal.

In some cases it has been sought to avoid the use of a binding medium, as well as the heating of the briquettes, by employing very high pressures, rising gradually to 11,000 pounds per square inch, for making briquettes; but although the briquettes made in this way have been very firm and offer great resistance to mechanical influences, they expand when exposed to heat and fall to pieces; besides which they are too dense, and this considerably interferes with their reducibility.

Of all systems of briquetting iron ores without a medium, by heating the briquettes after they have left the press, the Grondal process, so called after the name of the inventor, has proved to be the most successful for magnetic ore.

The following is a short description of this process: the raw ore, containing 27 to 58 per cent. of iron, is broken up by means of a stonebreaker and then ground to sand in a ball-mill. From this sand the pure magnetic ore, the so-called "concentrate," is extracted by means of magnetic separators.

The "concentrate," containing from 67 to 71 per cent. of iron, is moistened and made into briquettes about 6 inches square and 2 1-2 inches thick, with rounded edges. No addition is made.

The briquettes are then laid in three rows edgeways upon small iron wagons and transported into a furnace heated with generator and blast-furnace gases. Heated and compressed air is supplied by means of a Korting blower in such quantity as to produce a highly oxidizing flame, whereby the magnetic ore (Fe_3O_4) is oxidized to peroxide of iron (Fe_2O_3). The sulphur is considerably reduced during this operation.

The following comparative table gives the chemical composition of the raw ores, concentrates, and briquettes in different cases:

Names of the Place	Raw Ores. Fe per Cent.	S per Cent.	P per Cent.
Flogberget	27.3	0.31	0.003
Herrang	40.2	1.21	0.003
Lulea	58.2	0.11	1.23
Strassa	46.8	0.03	0.015
Cornwall, U.S.A.	30.6	1.60	0.012

Concentrates. Fe per Cent.	S per Cent.	P per Cent.	Briquettes. Fe per Cent.	S per Cent.	P per Cent.
67.4	0.04	0.003	65.3	0.007	0.003
67.3	0.17	0.002	65.5	0.003	0.007
71.1	0.015	0.005	69.3	0.005	0.005
69.2	0.015	0.003	67.1	0.005	0.003
69.9	0.036	0.003	67.9	0.010	0.005

One furnace, about 150 feet long and 5 1-2 feet wide, produces, on an average, 200 tons of briquettes in a week, the cost of production being given as 3s. 4d. per ton of finished briquettes, exclusive of general expenses and royalties.

The briquettes are hard and porous, and quite suitable for the blast-furnace; but the cost of production appears to be rather high, in consequence of which the Grondal process has not, except in Sweden, been much adopted. In Sweden there are at present twenty-seven Grondal furnaces at work, with a total output of about 300,000 tons of briquettes per year.

The reason why the Grondal process is of special value to Sweden lies principally in the fact that the working of the blast-furnaces in that country is almost entirely based on the use of charcoal. The slag of charcoal-furnaces being—for well-known reasons—acid, it does not absorb sulphur, consequently nearly all the sulphur in the iron ore goes into the pig-iron instead of into the slag. This is also the reason why the blast-furnace owners in Sweden object to use any iron ore containing more than 0.015 per cent. sulphur. From the above comparative table it will be seen that the raw ore contains considerably more sulphur than the above-mentioned limit, and it is therefore absolutely necessary to reduce the percentage of sulphur in the raw ore, not only by means of the magnetic separator, but also by heating the briquettes to a high temperature (given at 1,400 degrees C.) and in an oxidizing flame.

Although the percentage of iron in the briquettes is somewhat reduced, owing to the transformation of magnetite (Fe_3O_4) into peroxide of iron (Fe_2O_3), this advantage is more than compensated for not only by the expulsion of sulphur, but also by the fact that peroxide of iron (Fe_2O_3) is much more easily reduced and requires considerably less fuel in the blast-furnace than black oxide of iron (Fe_3O_4).

Considering that charcoal is becoming more and more scarce from year to year, and, as a consequence, more expensive, the question of economizing fuel is of special importance to Sweden.

Experience has shown that briquettes made of Fe_3O_4 (magnetite) require in the blast furnace 300 pounds more charcoal per ton of pig-iron than those made of Fe_2O_3, equal weights and percentages of iron being taken in each case. This difference in the consumption of charcoal represents a reduction in the working expenses of about 6s. 6d. per ton of pig-iron in favour of Fe_3O_2 against Fe_3O_4. The success of the Grondal process, notwithstanding its high cost, is therefore justified for Sweden, as well as in such other countries in which charcoal, together with sulphurous ores, have to be employed.

Considering that the melting point, and therefore the sintering temperature, of magnetite, is comparatively low, the briquettes made of "concentrates" (Fe_3O_4) begin to sinter and to harden at a temperature of from 800 degrees to 900 degrees C. However, as already mentioned, the temperature is raised to about 1400 degrees C., in order to expel as much sulphur as possible. It may also be mentioned that the process of converting the Fe_3O_4 into Fe_2O_3, being an oxidation process, is accompanied by a development of heat, thus economizing fuel to a certain extent.

The suggestion has been made of using briquettes made of "concentrates" directly in the open-hearth furnace, as a decarburizing and, at the same time, enriching addition to the metal bath.

The use of iron ore in the open-hearth furnace for that purpose is already well known, but such ore must be comparatively rich in iron, and it must not contain noxious substances to such an extent as to interfere with the quality of the steel produced. From the chemical analysis, given in the foregoing comparative table, it will be seen that the "concentrates" (and therefore the briquettes made therefrom) quite fulfil these conditions, the percentage of sulphur in the "concentrates" varying, with the exception of those from Harrang, between 0.015 and 0.04 per cent. Considering, further, that, as a rule, only 25 per cent. of iron ore is used in the open-hearth furnace, the contents of sulphur in the ore added will be indirectly reduced to one-fourth (0.004 per cent. to 0.01 per cent.) in the finished steel, which is not high enough to interfere with its quality. In the case of briquettes made, as suggested, from concentrates, for use in the open-hearth furnace, it would not be necessary to heat them up to 1,400 degrees; it would

also not be necessary to oxidize them from Fe_3O_4 to Fe_2O_3, and to make them porous. For use in the open-hearth furnace they can be pressed at a considerably higher pressure whereby they would become more compact, which is more advantageous for use in the open-hearth furnace, because they will then be specifically heavier, and therefore sink deeper in the bath, instead of floating upon the surface for a long time, like red or brown iron ore, which, with the exception of specular iron ore, is comparatively much lighter in weight.

As Fe_3O_4 commences to sinter at a temperature of from 800 degrees to 900 degrees C., the briquettes made of "concentrates" will become hard at this temperature, and need not be heated above it. This advantage, together with the fact that they need not be porous (and therefore not changed from Fe_3O_4 to Fe_2O_3), makes the briquettes considerably cheaper and richer in iron when used in the open-hearth instead of in the blast-furnace.

In order to avoid the cost of briquetting, an attempt has been made to agglomerate the fine-grained ore in a rotary furnace. This method appears to be of special value in cases where the agglomeration can be combined with the roasting of the ore, should the latter be necessary or advantageous, as, for instance, when spathic ore, brown iron ore, or iron ore with a high percentage of sulphur is to be agglomerated.

The fine-grained ore to be agglomerated in a rotary kiln is mixed with coke-dust (which can generally be procured very cheaply) in order to reduce the oxygen in the ore. The Fe_2O_3 in the ore can thus be partly changed into FeO, which would enrich the ore in Fe, and, at the same time, reduce the temperature necessary for agglomerating.

Considerable difficulties have, however, been experienced with this method of agglomeration. First, it has been difficult to regulate the temperature in the rotary furnace in such a way that the necessary sintering should take place without melting. Secondly, it has been found that the ore, as soon as it commences to agglomerate, adheres to the inner fireproof lining of the rotary furnace, thus causing scaffolds, which have to be be removed at considerable expense.

These difficulties are more frequently experienced in cases where coal-dust firing is employed for heating the rotary furnace, because, in these cases, the ashes of the coal, consisting chiefly of silica and alumina, mix with the ore and cause scaffolds, besides indirectly reducing the contents of iron in the agglomerated ore. The use of gas instead of coal-dust firing may therefore prove advantageous in this case, partly because the temperature in the rotary furnace can be more easily regulated according to requirement, and partly because no ash becomes mixed with the ore.

Briquetting by Means of a Binding Medium.—The use of slaked lime as a binding medium for fine-grained ore has been known for many years, and it has also been found that briquettes quite suitable for blast-furnace use can be made when the slaked lime is mixed with some granulated basic slag. Compared with other methods this process of briquetting is rather expensive and also considerably reduces the percentage of iron in the briquettes, because from 7 to 8 per cent. of binding material, containing no iron, has to be used. Besides this, the briquettes have to be exposed for a considerable time to fresh air in order that the calcium oxide in the briquette may absorb sufficient carbon dioxide, because hydrate of lime as such would lose its water in the upper portion of the blast-furnace, and the briquettes would therefore crumble to dust. The transformation of CaO into $CaCO_3$ also means another indirect reduction of the percentage of iron in the ore, not to mention that a great amount of space and extra labour are required for stacking and keeping the briquettes, in order that this transformation takes place. This method of briquetting ore has therefore not found extensive application.

Burnt lime, either alone or mixed with clay or ashes, has also been tried, but without success. This may easily be understood from the fact that—owing to the presence of steam and carbonic acid in the upper portion of the blast-furnace—burnt lime absorbs water and carbonic acid, thus changing into hydrate of lime. These reactions—being accompanied with a certain evolution of heat—cause "upper heat," a serious inconvenience known to every blast-furnace manager. Besides these there are other disadvantages attending the use of lime. Gypsum, as well as cement, has also been tried as a binding medium. The former contains too much sulphur, and neither resists the influence of heat, although the briquettes withstand humidity as well as mechanical influences.

More success has been achieved by using as a binding medium a mixture of sand and slaked lime. Equal parts of these materials are mixed and ground into fine powder, and then intimately mixed with the dust ore. After being moistened the mixture is pressed into briquettes, charged into boilers, and exposed for some hours to the influence of superheated steam under pressure, after which the briquettes are ready for the blast-furnace. About 6 per cent. of the above-mentioned binding medium is required.

This method of briquetting iron ores depends on the fact that the silica in the sand—owing to the influence of superheated steam—is converted from the insoluble into the soluble condition, ready for combination. This method has given very good results in respect of the quality of the briquettes produced, but it has not found very general practice on account of its high working expenses as well as its high initial outlay.

Another method of briquetting, based on the same principle, consists in the use, as a binding medium, of basic blast-furnace slag, which was exposed to steam pressure as mentioned before. However, as nearly 10 per cent. of this medium is required to obtain good briquettes, it has been found that the percentage of iron in the ore becomes too much reduced.

Spathic ore, mixed with lime, is also successfully used as a binding medium, provided that the briquettes are exposed to steam pressure for a certain time. This process is based on the fact that hydrate of lime and carbonate of iron (spathic ore), when intimately mixed and exposed to steam pressure, become converted into hydrated ferrous oxide and carbonate of lime (limestone). The former, being of a gelatinous nature ,serves as a binding medium and changes, later on, into hydrated sesquioxide of iron. This process is carried out in the following manner: A mixture of two parts of spathic ore with one part of lime, reduced to powder, is prepared. Of this powder 15 per cent. is added to the ore to be briquetted, the whole moistened—whereby the lime is converted into hydrate of lime—and made into briquettes under a pressure of about 6,000 pounds per square inch. These briquettes are packed—edgewise—on wagons, after which they are charged into boilers where they are exposed to a steam pressure of eight atmospheres for a period of 4 1-2 to 6 1-2 hours. In case spathic ore alone is to be briquetted an addition of 6 per cent. of lime is sufficient. In the latter case cylin-

drical briquettes of about 5 1-2 inches diameter and 4 1-2 inches in height are generally made.

The briquettes made according to this method are very good, but expensive, besides which that plant requires a comparatively high initial outlay.

Great success has been obtained in briquetting blast-furnace flue-dust, which is principally due to the fact that this by-product already possesses hydraulic properties, because—like cement—it contains lime, alumina and soluble silica ready for combination. In addition to this it has been found that by adding certain salts, such as chloride of magnesium, chloride of calcium, green vitriol ($FeSo_4 + 7H_2O$), or acids, such as sulphuric or hydrochloric acid, those hydraulic properties can be raised to such a degree that very suitable briquettes can be made from the dust.

Of these additions chloride of magnesium ($MgCl_2$) has been found to be, generally speaking, the most suitable, because it is cheap (being a by-product in the manufacture of certain artificial manures), and because it does not contain any noxious substances. Owing to the high temperature in the blast-furnace, the chloride of magnesium is decomposed into magnesium and chlorine. The former enters into the blast-furnace slag as MgO, and the latter combines with hydrogen to form hydrochloric acid. The acid further combines with the free lime to form chloride of calcium, which is finally absorbed by the water used for washing the blast-furnace gases. In some instances it has been observed that the iron portions of the furnace top become slightly attacked, which is ascribed to the presence of sydrochloric acid not fully neutralized.

This process of briquetting, called after the inventor the "Schumacher" process, has given very satisfactory results, not only with reference to the quality of the briquettes produced, but also as far as cost of production and initial outlay are concerned. It must, however, be pointed out that the blast-furnace flue-dust used for briquetting, must be used almost immediately after having been removed from the catchers, and that, like cement, it must be protected against humidity before briquetting. The installation for briquetting flue-dust should therefore be situated in the close proximity of the blast-furnace from which the flue-dust is taken.

It is to be regretted that this process can only be used for briquetting blast-furnace flue-dust. With the exception that in some instances where the chemical composition of the flue-dust is particularly favourable to the purpose, an addition of about 40 per cent. of purple ore to the flue-dust has been found to be admissible; the latter thus acting, as it were, as a binding medium to the former.

Another method of briquetting flue-dust consists in the use of basic blast-furnace slag, after having been exposed to steam pressure. Owing to the influence of compressed steam the silica in the slag changes from the insoluble to the soluble variety, and combines with the lime in the flue-dust to a kind of cement, which acts as a binding medium. If the lime in the flue-dust is insufficient, another 4 to 4 1-2 per cent. is added. The briquettes made in this way are quite suitable; but taking into consideration that from 8 to 12 per cent. of binding medium, containing no iron, has to be used, the contents of iron in the briquettes is too much reduced to make this method profitable.

Organic matters, such as the waste lye, resulting (as a by-product) from the manufacture of sulphide cellulose, and molasses have been used for briquetting flue-dust as well as other iron ores. In the former case, the lye is concentrated to a syrup, thus constituting a kind of pitch, called "Zellpech" ("cellulose-pitch") in Germany, where it is used. On an average, about 6 per cent. of this binding medium is intimately mixed with the flue-dust or ore, and pressed into briquettes under a pressure of not less than 9,000 pounds per square inch. The briquettes made with "cellulose-pitch" are suitable, but, as the binding medium is very expensive (40s. a ton), the financial success of this method is rather doubtful.

The use of molasses as a binding medium was tried for briquetting the ferriferous residues of the aniline manufacturing process, as well as for briquetting flue-dust—this process being as follows: One part of cheap molasses, by volume, is mixed with two volumes of silicious sinter ("Kieselguhr"), 0.4 parts by volume of carnallite and 100 parts by volume of the ore, to be briquetted. The briquettes are allowed to dry in the open, after which they are charged into the chambers of an annular furnace, such as is used for burning ordinary bricks. Here they are heated up to 1,000 degrees C., when they begin to sinter and to harden.

This method of briquetting is accompanied by high working expenses and considerable initial outlay. The employment is therefore only justified when the by-product of the aniline manufacturing process, containing about 67 per cent. of iron, is to be made into briquettes.

As before mentioned this process was also tried for briquetting blast-furnace flue-dust, but it was abandoned, probably on account of the too high cost.

Besides the above-mentioned methods of briquetting fine-grained ores, or blast-furnace flue-dust, etc., there are numerous other methods of briquetting with or without a binding medium. In the former case soluble glass (alkaline silicate), asbestos, basic slag, naphtalin, paraffin, resinous soap, as well as other inorganic and organic materials, are used, and in the latter case smelting is conducted in a reverberatory furnace. Treatment with liquid iron, or in an electric furnace, has been proposed and also tried in practice, but in all cases without result. As there is also no reason to believe that these methods will ever be tried again, the author does not consider it necessary to go into details about them.

Conclusions.—From what has been said it may appear that a universal method of briquetting fine iron ore, fulfilling the conditions enumerated in each case, has not been invented as yet, and probably never will be.

Taking the financial results of the different methods of briquetting into consideration, it is found that the methods of briquetting practised at Kertsch, in Russia, and at Ilsede, in Germany, appear to be the most economic, the working expenses, as reported, amounting only to one shilling per ton of briquettes. As already previously mentioned, this method can, however, only be applied successfully when the ore contains sufficient hydrate of alumina to serve as a medium.

The manufacturing expenses of briquetting by the Grondal process amount to 3s. 4d. per ton of briquettes, exclusive of general expenses, redemption, and royalties, for which at least 1s. 4d. will have to be added, thus resulting in a total expense of 4s. 8d. per ton of briquettes. This would be far too high to allow of the general introduction of this process. However, the Grondal process is of particular value for Sweden, where its use has become almost unavoidable in order to be able to utilize the iron ore of that country; besides, its use is, in Sweden, combined with a saving of 6s. 6d. per ton briquettes in fuel, thus resulting in a final saving of

1s. 10d. (6s. 6d. — 4s. 8d.) per ton in favour of the Grondal process. Similar results may also be obtained with this process where charcoal is used as fuel in the blast-furnace.

Of all the different methods employed for briquetting blast-furnace flue-dust, the "Schumacher" process has given the best financial results, the cost of briquetting according to that method, amounting to 1s. 8d. per ton briquettes only, without royalty.

The other methods of briquetting iron ore flue-dust and other ferruginous residues of other industries, as described before, have given less favourable financial results, the cost of briquetting amounting from 2s. 6d. to 3s. 9d. per ton briquettes. Besides this it must be mentioned that where a binding medium is used, on an average about 7 per cent. is required to be added to the ore, thus reducing considerably the percentage of iron. In several cases it has also been found necessary to stack the briquettes for several weeks in the open before they could be used, thus requiring a good deal of space and extra labour for transporting and handling.

Finally, it may be mentioned that at present an establishment for making briquettes is being erected at a Belgian works according to a new process recently introduced. According to this method from 2 1-2 to 4 1-2 per cent. of binding medium, costing about 16s. a ton, is used. The initial outlay for a plant turning out 5 tons of briquettes an hour, amounts to about £2500, and the manufacturing expenses, inclusive of general expenses, to 1s. 6d. per ton briquettes. The briquettes fulfil all the conditions enumerated previously, and can be used within twenty-four to thirty-six hours after having left the press, no heating or any additional work being necessary. By this method, not only fine ore, but also rolling-mill and forge-scale (Fe_3O_4) have been briquetted with success, the latter having been successfully used as an enriching and decarbonizing addition in the open-hearth furnace.

NORTHERN PARTNERSHIP GROUP, ATLIN MINING DIVISION, B.C.

Last month the CANADIAN MINING JOURNAL published a contribution by E. Jacobs on the Engineer group, Atlin, B.C. The subjoined description of the Northern Partnership group, formerly the Engineer group, is from a bulletin recently issued by the Bureau of Mines, British Columbia, and written by Mr. Herbert Carmichael, Provincial Assayer, who recently visited the property.

"This property is better known by its old name of the Engineer Group. The claims now included in the group are Engineer No. 1, Northern Partnership No. 1, Northern Partnership No. 2, Northern Partnership No. 3, Haddon, Big Engineer Fraction, Little Engineer Fraction, Plato, and Mickey. The owners are the Northern Partnership Syndicate, with head office at Atlin, B.C. The mines are situated on the east side of Taku Arm of Tagish Lake, ten miles farther up the lake than Golden Gate, in Atlin District.

"This property, then known as the 'Engineer Group,' was reported on by the Provincial Mineralogist in 1904; since then it has changed hands, having been purchased by the present owners in 1907. The country rock on this group of claims is slate, cut by igneous dykes and traversed by numerous quartz veins, some mere stringers and others up to 30 feet wide. A very considerable amount of surface prospecting and development of these veins has been done, consisting of numerous open cuts and shots put in at different points; in all cases this work has shown up clearly defined quartz veins, traversing the slate formation, cutting through both the country rock and the dykes before referred to. The general strike of the country rock is N. 65 degrees W., with a dip of 35 degrees to the northeast; the majority of the dykes seem to have a strike of 15 degrees farther north, but to have a much greater dip, being 80 degrees to the southwest. These dykes are clearly marked, as owing to their harder nature they have been left standing, while the softer slate rock has been eroded away. The main quartz veins seem to have a general strike of about N. 10 degrees W., and a dip of 70 degrees to the east, but there are numerous cross-veins whose dip and strike vary considerably. The actual mining done by the present owners has been confined to the smaller quartz veins from 6 inches to 2 feet wide; the ore from these veins yielding high values in free gold and tellurides. According to the statement of the owners, 800 pounds of the selected ore yielded 240 ounces of gold, and from the appearance of this ore, which is in places crusted with free gold, there does not seem any reason to doubt the statement.

"The larger veins are being opened by shots and cross-cuts and are said to give values from $20 to $100 per ton, but as yet none of this ore has been run through the mill, and until such test has been made it is impossible to form any safe idea of their value. The quartz looks good; the veins are clearly defined and have been traced for considerable distances; they can be easily worked, so there is a fair prospect that they will yield good, if not high, returns.

"From the shore of the lake the ground rises abruptly to a bench some 500 feet above the lake; this bench goes back some distance, when the mountains rise to snow-capped peaks 4,500 feet high. At 300 feet above the lake a quartz vein has been worked by two open cuts, one a little below the other and having a total length of 170 feet; in these cuts the vein is clearly defined and has an average width of about 2 feet 6 inches, the quartz carrying a considerable amount of calcite and showing free gold in both the quartz and the calcite, with specks of tellurides through the former. The ore is generally straight quartz with calcite, but in places it is a slate breccia which has yielded high values from the thin intersecting seams. The ore from these open cuts is being carefully sacked and hauled to the stamp-mill on the shore of the lake and forms the base of the present ore-supply.

"A short distance to the northwest a small cross-vein, running towards the vein just mentioned, is being worked by an open cut, and similar ore has been taken out. About 1,000 feet south of the large open cuts and at 100 feet lower altitude is what is locally known as the 'South Vein.' This is a brecciated quartz vein 6 feet wide with well-defined walls, but as yet no work has been done on it. A small cross-vein runs from this vein to the lake, and from the lake shore a tunnel is being started which will follow the strike of the vein, which at this point is some 18 inches wide and carries a very large proportion of calcite with free gold crusted in the solid calcite. Work was commenced on this vein as it showed high values, was close to the stamp-mill, and easy to work.

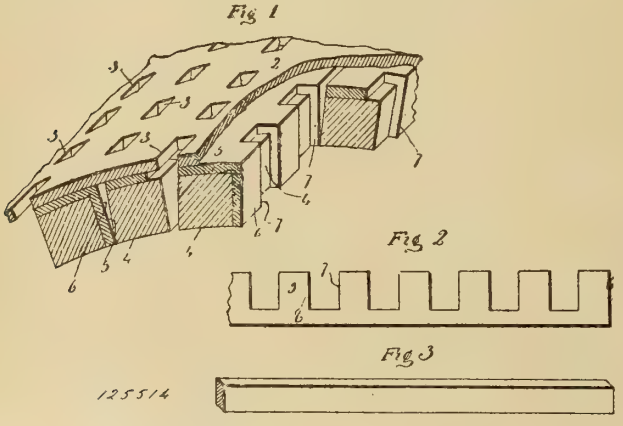
"On the Big Fraction claim, 2,000 feet north of the large open cuts and 500 feet above the lake, what may be called the main vein has been uncovered by a few shots. This is a quartz vein with a north and south strike and including an amount of slate breccia; the width of this vein is still undetermined, but may be taken as at least 30 feet, while it has been prospected by an open cut 1,000 feet farther north and traced still farther through several claims. It is proposed to run a

few tons of this ore through the mill to ascertain its value, which is at present unknown.

"About 100 feet back of the shore line and 100 feet above the lake is a quartz vein of undetermined width, but probably 8 to 10 feet wide; to cross-cut this vein the former owners ran a tunnel in 150 feet and did some 150 feet of drifting. They did not get in far enough to cut the ledge seen above, but cut a number of small stringers which they drifted on, in one place cutting through about 10 feet of quartz-slate breccia which may have contained values. The present owners intend pushing the tunnel till the vein is reached.

"A short distance to the south, where this vein outcrops on the lake shore, the former owners sunk a shaft said to be down 70 feet, but now full of water, and no data were obtainable from it. Close to this shaft on the lake shore a two-stamp mill was set up in March of this year and commenced running in June on the rich ore from the open cuts, yielding, as stated, 240 ounces of gold from 800 pounds of ore treated; lower grade quartz was being run through on August 5th, and said to be yielding $100 per ton.

The plant consists of two heavy stamps and a double-discharge battery running over two amalgamated plates; a vanner is being set up to save the concentrates, which at the present time are largely going into the lake. Power is furnished by a small engine and boiler, but when a larger plant is installed ample water power is to be had from a stream near the mill.

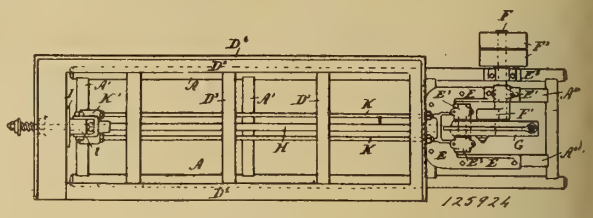


Summary.

The property contains a number of small quartz veins carrying high values in free gold, which give good returns under the present primitive method of working. There are larger veins, which, with a well-equipped plant and economical methods, would probably yield a large tonnage of lower grade quartz which would pay for treatment; these veins should first, however, be prospected and carefully sampled.

CANADIAN PATENTS.

Byran LaPort Morrison, assignor, and Joseph Wesley Ady, assignee of a third interest, both of Colorado Springs, Colorado, U. S. A., 10th May, 1910; 6 years. Filed 11th April, 1910. Receipt No. 181,835.



No. 125,514. Tube Mill. *Moulin à tubes.*

Claim. A tube mill comprising a barrel having a feed opening at one end and a driving head at the opposite end, the ends connected by a shell having a series of perforations, a lining comprising rectangular bars, notched strips between the bars and shell, said strips formed with flanges turned downward between the bars and having the notches therein registering with the perforations in the shell.

William Henry Roughsedge, Ottawa, Ontario, Canada, 24th May, 1910; 6 years. Filed 14th August, 1909. Receipt No. 173,328.

No. 125,924. Gold Saving Table.
Table à obtention de l'or.

Claim.—1. In a gold saving table the combination of a bed frame, a table with a top sloping longitudinally and transversely, having longitudinal rollways supported on wheels and axles journalled on said bed and having its transverse slope adjustable, a driving shaft journalled upon the upper end of said bed frame and having a crank, a bell crank lever pivoted adjacent to and operated by said crank, a pitman pivoted to said bell crank lever at one end and to the lower end of the table, a bumper head at the lower end of the table, a stop secured yieldingly to the lower end of the bed frame and connected to the upper end of the said frame by bolts against which stop the bumper head impinges, means of adjusting the transverse slope of the table, a table top mat having a plain rear space and plain lower end space and oblique and varying ridges and channels, a feed box at the upper end and rear of the table, a wash water box at the rear of the table, a launder at the front edge of the table and a receiver at the delivery end of the table, substantially as set forth.

PERSONAL AND GENERAL.

Mr. J. Mitchell Gordon has left the employ of the Fife Coal Company, Limited. His present address is in care of the Fanti Consolidated Mines, Limited, Tarquah, Gold Coast Colony, West Africa.

Mr. R. B. Lamb, mining engineer, made a professional visit to Gillies Limit on September 17th.

Dr. W. G. Miller returned to Toronto from Europe on September 16th.

Mr. J. H. Plummer has returned to Sydney from England much improved in health.

Mr. Frank Loring recently visited Porcupine.

Mr. G. M. Colvocoresses was in Toronto on September 15th.

Mr. J. W. Astley is shortly to open an office in Toronto. Mr. Astley was, until recently, consulting engineer to the Peterson Lake Cobalt Silver Mining Company.

Mr. J. T. Fee, formerly of Cobalt, is developing limonite deposits on the Mattagami.

Mr. J. B. Tyrrell has returned to Toronto from London, England.

Mr. E. T. Corkill has recovered fully from his recent illness.

Mr. T. W. Gibson, Deputy Minister of Mines for Ontario, visited Eastern Ontario mining districts early in September.

Mr. Critchley Parker, editor of the Australian Mining Standard, Melbourne, Australia, is touring Canada.

Mr. Herbert Carmichael, of Victoria, B.C., Provincial Assayer, has gone to England on a brief visit.

Mr. Clifford E. Smith is paying a professional visit to Tweed, Ont., where he is interested in iron pyrites properties.

Mr. M. S. Davys, managing director of the Kootenay Development Syndicate, and the Silverton Mines, Limited, both of which he organized in England, has returned to that country after a visit to West Kootenay district of British Columbia, in which he still has important mining interests.

Mr. W. C. Thomas, formerly manager for the Dominion Copper Company, which owned copper mines in the Boundary district, with smelting works at Boundary Falls, B.C., recently returned to British Columbia, and is now resident in Vancouver.

Mr. W. L. Coulson, of Vancouver, B.C., manager of the Canadian Collieries (Dunsmuir), Limited, lately examined some Rocky Mountain coal property, in Northwest Alberta.

Hon. Wm. Templeman, Dominion Minister of Mines, has returned to Victoria after having accompanied Sir Wilfred Laurier on his late tour through British Columbia.

Mr. Charles Graham has been examining the Nicola Valley Coal & Coke Company's Middlesboro' coal mines. He has been mentioned as likely to succeed Mr. James Gray as manager of the company's colliery in Nicola Valley, B.C.

Mr. O. S. James has resigned his position as chemist and assayer with the J. E. Wilkinson Company and is now open for engagement. His address is 227 George Street, Toronto, Ont.

Mr. D. P. Roberts, late chief electrical engineer for the City of London, Ontario, has been appointed by the Provincial Government inspector of electrical energy in British Columbia. This appointment interests mine and smelter owners, since purchased electric power is used at the larger smelters and some of the bigger metal mines in the province.

Mr. D. G. Macdonald, superintendent of the Dominion Lode Development Company, which is developing a quartz mine situated on the divide between Dominion and Lombard Creeks, Yukon Territory, is on a visit to his home at Oakland, California.

Mr. James F. Flynn, New York, has returned from an extended visit to Porcupine, during which he examined several properties and looked over the leading mines. Mr. Flynn speaks most encouragingly of the district.

A recent despatch from Washington says that President C. R. Van Hise, of the University of Wisconsin, is mentioned as a possible successor to Secretary of the Interior Ballinger. Dr. Van Hise is well known to Ontario mining men, as he has given considerable time to the study of the geology and ore deposits of this province. He and his associates have investigated the iron resources and the cobalt-silver deposits. In the United States he is well known for his work on pre-Cambrian geology and the Lake Superor iron region. Since becoming president of the University of Wisconsin, he has raised it to first place among the state universities. He is one of the leading apostles of conservation in the United States.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Halifax.—The new report forms being issued by the Department of Mines of Nova Scotia promise to do good work. The "Coal Depletion Statements," as they are called, are placed before every colliery manager and every manager is required to fill them out accurately. The information that will be collected by means of these sheets will provide an annual inventory of the province's coal assets. Mr. Hiram Donkin, Deputy Minister of Mines, is responsible for this innovation.

Largely through the efforts of Mr. H. C. Borden, the Moose River tungsten deposits are being rapidly developed. Manager A. A. Hayward struck a new vein some weeks ago. Since then the discovery has shown up very well.

The Dominion Coal Company's outputs show a substantial increase over those of last year. Last year, of course, was marred by the strike.

The discovery of oil near Lake Ainslie, Cape Breton, has been confirmed. Much more work will be necessary to determine its value. A new hole is being drilled.

Activity in gold is increasing in both the eastern and western parts of the province. In Halifax County, four old mines have been re-opened during the past three months. To the west at least an equal number of antiguas have been brought to life.

Several inspections of the tin-bearing granite near New Ross, Lunenburg County, have been made lately. Parts of the outcrop are exceedingly rich.

The infusorial earth deposit near Bass River, Cumberland County, once the scene of a thriving industry, is being worked by a group of Oxford (Cum. Co.) investors, apparently with satisfactory results.

ONTARIO.

Cobalt, September 17th, 1910.—A large number of men have been prospecting all summer on various lots in the Gillies Limit, and, although several promising veins have been found, nothing really important has developed. The only properties that have found good ore are the Waldman and the Wyandoh. The discovery of the Waldman vein was the reason for the much higher prices that prevailed at the last sale. This is the same vein that is on the Waldman, and is the only one so far from which ore can be shipped. The Yorke-O'Brien also has a vein carrying medium grade ore, but this was traced across from the Red Jacket.

A number of good discoveries have lately been made on the Townsite, which have greatly increased its value. Trenching operations have resulted in the discovery of four veins near the boundaries of the Buffalo and the City of Cobalt. Two of these show a good width of high-grade ore, and the others show good ore in places. An extension of the ore shoot on the fifty-foot level of the main vein has also been opened up. It is believed that the property will shortly be in such shape that regular shipments can be made.

At the Provincial mine, the workings from the old shaft have been abandoned and operations in the future will be carried on from the new shaft, which was put down near the boundary of the Savage property. At the 175-foot level a station has been cut and a drift started on the vein, which at this point carries small values in silver. A cross-cut will shortly be started to open up No. 7 vein, which is running parallel.

In the northeast cross-cut on the third level of the Coniagas, two small veins have been cut. Since the new addition to the mill started running regularly this property has been concentrating a greater tonnage than any mine in the district, about 175 tons per day now being treated.

At a directors' meeting of the Temiskaming Mining Company held a short time ago, a very encouraging report for the month of August was presented. During that month 251,963 ounces were produced, 30,000 of which came from the concentrator, while the remainder was from high-grade ore from the 450-foot level. The total cost for the month's production amounted to

$22,014.63. The output for the first seven months of the present year is 1,103,693 ounces.

A remarkable case of stealing occurred recently at the Nova Scotia mine. The company had in its safe a number of bars of silver bullion, valued at approximately $18,000, which it intended to ship on September 7th. On the night previous the safe was broken into in a very daring manner, and all the silver was removed. The company immediately offered a reward of $1,000 for the return of the silver, and the local police, besides a number of private detectives, were soon working on the case. Before their investigations had proceeded very far, however, there was a split among the thieves as to the division of the loot, and one of them turned informer. As a result seven men were arrested and the whole of the silver recovered. Some of the thieves turned out to be employees of the company, while one of the others has been known for years to be a high grader, and was among those arrested in the case with Dr. Wilkinson.

The August shipments amounting to 3,099 tons, constitute the largest output for any month of the present year, and show an increase of 800 tons over the corresponding period of 1909. The total shipments for the first eight months of 1910 are 20,957 tons, which were produced by twenty-eight mines. Bullion shipments up to date amount to 343,163 ounces, produced from five mines. The shipments from Gowganda and Elk Lake for the same period total 435 tons.

An important deal has just been put through, whereby Mr. David Faskin has purchased the control of the Cobalt Power Company formerly held by Beech Bros. Mr. Faskin is president of the Hydraulic Company, and these two concerns have in the past been closely identified. In fact, the first electric power distributed to the mines in Cobalt was generated by the Hydraulic Company at its plant at Ragged Chutes and sold at wholesale rates to the Power Company.

Surface trenching on the Badger has lately been the means of uncovering two new veins. They are both in the Keewatin formation and carry low values in silver. In order to determine their value underground a cross-cut will be run from the first level of the No. 5 shaft. During the summer a total of 6,000 feet of trenching has been done.

Progress is being made with the new concentrator at the Hudson Bay mine. The capacity will be about fifty tons per day and some features that are new to the mills of the district are being installed. The concrete work is all finished and a good part of the frame is already up. All the machinery is on the road and will be installed as soon as possible. The company hopes to have the mill in operation about the first of next year.

On lot No. 1 in the Gillies Limit a vein carrying quantities of galena has been found. In places the ore is practically solid and it assays up to thirty ounces of silver to the ton. The owners will endeavour to ship a carload to Perth Amboy. A shaft has been sunk fifteen feet on the vein, and the ore is showing strong in the bottom.

The Black Mines have run short of funds and an effort is now being made to raise more money to carry on the development work. The shareholders are being asked to make a loan of $25,000 to the company, which will bear interest at the rate of seven per cent. and be payable in one year. The loan will be secured by the company's plant and property.

The management of the Buffalo mine has decided to increase the capacity of the cyanide plant so that it will be able to treat seventy tons a day. The capacity of the concentrator is not being increased, but some minor changes have been made in the flow sheet that will divert more of the tailings to the subsidiary plant. It is expected that the labour and power costs can be reduced and that a better extraction can be made. The consumption of cyanide per ton will also be less when the necessary changes shall have been made.

Recent developments in the vicinity of the No. 1 shaft of the Trethewey have been the means of opening up a large body of milling ore. Not enough work has been done on it as yet to determine its limits.

The Bailey management has decided to erect a small smelting plant for the ore which they purpose mining shortly. It will consist of two oil-burning furnaces, each holding six large crucibles. No details are as yet available as to the capacity, cost of operation and process of treatment. The experimental work was done by Mr. E. A. Benson, the president, who states that he has obtained good results. The economic working of such a plant for a small tonnage, is, however, extremely doubtful.

The Crown Reserve has decided to cut out shipments of low-grade ore, and to increase the machinery in the ore house so that in the future only high-grade ore will be shipped. The new vein found down the lake has been drifted on for 100 feet and the working is in ore all the way. The drift on the Victoria vein has been extended another twenty-five feet and the face is still in good ore.

Gowganda.—The machinery for the Reeves Dobie mill is already on the road, and a considerable part of it is in Elk Lake, from which point it will be teamed to the mine. It is estimated that there are 15,000 tons of milling rock in sight and that the high-grade ore will be sufficient to pay operating expenses.

The management of the Millerett has also decided to put in a small mill, although it is probable that the machinery will not be taken in until the winter roads are in shape. Development work on this property is very encouraging and at the 185-foot level the vein shows a good width of high-grade ore. Another small shipment was made a few days ago via the Montreal River.

The Gates property has also made a shipment of twenty tons of high-grade ore. After losing their vein several times, a fine ore shoot was picked up on the 140-foot level. The mine shows every promise of becoming a regular producer.

Several discoveries of minor importance, chief of which is the one on a claim owned by Otisse and Currie, near Hubert Lake, have lately been made in the vicinity of Elk Lake. At a depth of 200 feet, a small aplite vein, carrying small values in silver, came into the Devlin shaft. Before continuing the shaft on this vein, however, a cross-cut will be run to cut the veins on which the shaft was originally started. A proposition to build a customs concentrator at Elk Lake came up before the council of that town a short time ago. Unfortunately there is no available tonnage in the district with which to supply it.

Porcupine.—This district has had its first snow storm, which occurred on August 25th, and since that time there have been some heavy frosts. The snow, of course, did not last, and it will probably be two or three months yet before it comes to stay. The rains have been very heavy and have seriously interfered with outside work.

On account of the stiff competition on the Kelso route, there has been a very material reduction in freight rates, and supplies can now be brought in for $2.75 and $3.00 per hundred weight. This will mean a very considerable saving to the operators, and will probably mean that more men will be employed.

There is activity in the Township of Shaw, and undeveloped claims have recently sold there for $4,000 each. Everywhere in the district, there is a strong healthy development, and the entire absence of wild-catting is one of the significant features. The most important work is being done on the Timmins and Dome properties. The former has a small prospecting mill that treats approximately one-sixth of the ore produced daily. The returns, however, are so large that they cover the entire cost of operating the property, which employs 135 men, and also leave a comfortable surplus.

On one of the claims in Shaw Township, the owner is panning the earth above the veins and is obtaining very good results.

The owners of the Swastika property have decided to install a five-stamp mill and a small cyanide plant. A small two-stamp mill has been in operation for some time and excellent results

have been obtained even though a large part of the values were not recovered.

It has been definitely decided to erect a stamp-mill of considerable size on the Dome property if proper transportation facilities are available. The size of the mill has not yet been decided upon. Although work was carried on under great difficulties, already 900 feet of underground development has been accomplished and the results are perfectly satisfactory to the owners. A considerable amount of diamond drilling was done, and the vein was cut at a depth of 300 feet, at which point it still continued to show free gold.

BRITISH COLUMBIA.

The British Columbia Bureau of Mines has issued Bulletin No. 1, 1910, being a "Report on Certain Mineral Claims in Atlin, Bella Coola, and Nanaimo Mining Divisions," by Mr. Herbert Carmichael, provincial assayer. The claims concerning which information is given are as follows: In Atlin division, the Northern Partnership Group, formerly known as the Engineer Group; in Bella Coola division, Sure Copper Mountain group and Bella Coola Chief group; in Nanaimo division, the Great Granite mines, Great Gold group and White Swan group, all on Valdes Island, and the St. Joseph group, on Lasqueti Island. While some useful information is given concerning the several properties mentioned in the first and last above-mentioned divisions, it is not clear what good purpose is served by the inclusion in this departmental publication of the page relating to claims in Bella Coola division, the most important of which were not visited by the officials.

It is respectfully submitted that this published result of an official visit to what is supposed to be a possible mining district is of little practical use. However, the redeeming feature of this bulletin is found in the fact that the information given relative to the Engineer or Northern Partnership group is of a nature that will enable those interested in the matter to judge for themselves what warrant there was, if any, for the statements widely published a few weeks ago relative to the intention to erect on the property a 100-stamp mill. As is customary with British Columbia government publications, this report is well printed and illustrated.

Cariboo.—Information has been received of the registration in London, England, of the Lightning Creek (British Columbia) Hydraulic Mining Company, Limited, with an authorized capital of £150,000, in shares £1 par.

Rain has fallen lately, but not in sufficient quantity to allow of hydraulicking operations being resumed. It now looks as if there will not be any more hydraulic placering this season.

Attention has recently been called to the fact that the recorded production of gold from Cariboo district had, by the close of 1909, exceeded an aggregate of $40,000,000. While the value of the average annual production in quite recent years has not been much more than $300,000, there is reason to expect a considerable increase after the large new hydraulic plant for the Quesnel Forks district shall be in operation. Seven or eight years ago an official report gave an estimate of the available low-grade gold-bearing gravels in this section as being 2,500,000,000 to 3,000,000,000 cubic yards, which at ten cents per yard gives a possible $300,000,000 worth of gold awaiting recovery here.

East Kootenay.—Before control of the Crow's Nest Pass Coal Company passed to the Great Northern Railway and allied interests, it was customary for the tonnage of coal produced to be published weekly in the Toronto Globe. For more than a year, though, similar information has not been regularly obtainable, the Nelson, B.C., correspondent of the Dominion Labour Gazette, included in his report, published in August, the following statement: "The tonnage mined by the Crow's Nest Pass Coal Company, at Coal Creek and Michel, for the month of June is reported at 116,447 tons, while the payroll for the same period amounted to $203,400." That tonnage would give a daily average production of 4,479 tons of coal for 26 working days. Recently, however, the Fernie Free Press has stated the daily average production for part of August to have been more than 5,500 tons a day. If the latter be correct, it is evident that there was a substantially large increase of output in August over the average daily production for June. In the summer of 1909 announcement was made at Fernie, by the then manager, of the intention of the coal company to considerably enlarge its production of coal, but this was not done so soon as promised. Lately, however, the forecasts then made seem to have been, in some measure, realized.

Ainsworth.—The recently organized Kootenay Silver-Lead Mines, Limited, has commenced work at the Highland mine and concentrating mill. Mr. H. Shell, late of Denver, Colorado, is manager, and has about 30 men in mine and mill. Silver-lead ore and concentrate are being shipped to the Consolidated Company's smeltery at Trail.

It is stated that the Highlander mine will soon be worked again. It has been idle several years. Much underground work has been done in this mine in past years, the main tunnel having been driven more than 2,600 feet, and drifts run from it on the veins intersected. When in operation, pumping and hoisting from winzes was done by compressed air delivered from the Taylor hydraulic air compressor on Coffee Creek, about two miles south of the mine. It is stated that the first drill every driven by compressed air derived direct from falling water, under the Taylor patents, was started in operation in this camp in April, 1900. A wire tramway connects the mouth of the tunnel with the company's concentrator near Kootenay Lake. About 700 tons of lead concentrates and 100 tons of hand sorted ore have been shipped; average contents, 67 per cent. zinc lead, 4 per cent. and 22 ounces silver.

[Note.—"Highland" and "Highlander" are separate properties.]

Nelson.—The Eureka mine near Nelson, recently again made a shipment of gold-copper ore after having been for a year or two on the non-shipping list. In 1907, 620 tons of ore was shipped, this giving an average assay value of 5.5 per cent. copper, besides some gold and silver. Since then the low price of copper has militated against production being continued.

Announcement has been made that a syndicate will take over the Silver King, Dandy and other mining properties, situated on Toad Mountain, near Nelson. During the last two years, until June last, the Silver King has been worked under lease by the Kootenay Development Syndicate, an English company, under arrangement with the liquidators of the Hall Mining and Smelting Company. Altogether, since 1896, more than 200,000 tons of ore have been extracted from this mine; the approximate total metal contents of this ore were 4,500,000 ounces of silver and 14,500,000 pounds of copper. While most of the known ore above water level has been taken out of the mine, it is believed there is still a considerable quantity that could be mined from the lower levels were the mine to be kept unwatered.

Rossland.—In connection with the recently reported leasing and bonding of Cliff and Consolidated St. Elmo properties by the Granby Consolidated Mining, Smelting & Power Company, it is of interest to note that in a preliminary report on Rossland mining district, by Mr. R. W. Brock, now director of the Geological Survey, there occurs this brief reference to this property: "The well-marked vein of the St. Elmo-Cliff-Monte Christo has produced several hundred tons of ore that averaged about $20, and a considerable tonnage of low-grade ore that has an excess of iron over silica, such as is desired by some of the smelters." Some development work is being done on the Cliff under the direction of Mr. W. Yolen Williams, of Spokane, Washington, who for several years superintended the development of the Granby Company's big mines in the Boundary district.

Information received from London is to the effect that Mr. A. J. McMillan, late managing director of the Le Roi Mining

Company, who has been appointed liquidator of the company in connection with its being voluntarily wound up, will return to Rossland from England during October.

Queen Charlotte Islands.—The Vancouver syndicate which some time ago bonded the Japanese group of gold-copper claims at Ikeda Bay, Moresby Island, has made a second payment of $30,000 (the first payment was $8,000), and has arranged with the vendors to accept $150,000 in stock in the new company, and a final payment of $12,000 in cash, to make up the purchase price of $200,000. The prospecting done with the diamond drill by the syndicate under the bond is reported to have proved the occurrence of two ore-bodies not previously discovered. One of these has been reached by driving a 50-foot cross-cut. Assay returns from the ore thus opened have ranged up to much higher value than the average of that shipped when the mine was producing two or three years ago. Total production to date is about 12,000 tons, of an average value of $11 to $12 in copper, gold and silver. The plan of further development contemplates provision for putting the mine in condition to ship an average of 100 tons of ore daily. The ore will be sent to the Tyee Copper Company's smelter at Ladysmith, Vancouver Island, for treatment, a favourable freight and treatment rate having been arranged.

GENERAL MINING NEWS.

NOVA SCOTIA.

Amherst, Sept. 22.—The Maritime Coal, Railway and Power Company, whose headquarters are at Montreal, and whose chief colliery is at the Joggins mines in this county, is making steady progress in developing the extensive coal fields owned and operated by the company. Its sea-going trade is steadily increasing, as is evidenced by the shipments for the week ending September 16th. During that week the company loaded ten schooners for ports along the Bay of Fundy. The schooners were as follows: The Adella, 100 tons; Emma T. Story, 60 tons; Annie Pearl, 60 tons; Abbie Vernor, 125 tons; Helen M., 110 tons; Abbie Keith, 180 tons; Laxvan, 140 tons; all of Windsor. The Dorothy, 90 tons for Digby; The Nettle, 125 tons for Briar Island, and the E. Mayfield, 100 tons for Partridge Island.

Sydney.—The Dominion Steel Corporation are calling for tenders for the erection of seven large buildings at the steel plant here, to be constructed immediately. Additions include boiler house, machine and railway shops, foundry warehouse, oil house, carpenter shop, repair shop, and finishing mill. The buildings will be entirely of concrete and structural steel. The company is also considering the advisability of building new general offices.

ONTARIO.

Cobalt, Sept. 26.—Two bullion shipments left the camp last week, one from the O'Brien, the regular shipment to England, and the other from La Rose. The total shipments of bullion now total 447,615 ounces, valued at $232,907. The two shipments which left this week were as follows: O'Brien—30 bars, weight 30,000 ounces; value, approximately $16,000. La Rose—31 bars, weight, 28,505 ounces; value, approximately $13,695. The total of the bullion shipments for the week is therefore 61 bars, weight 58,505 ounces; value, $29,695. The La Rose bullion was consigned to the La Rose Consolidated Mines, Limited, Broadway, New York.

Collingwood, Sept. 22.—Mr. J. R. Roaf, barrister of Toronto, met the Board of Trade last night and discussed a proposal to establish extensive iron works here. The new company is at present known as the New Iron Company, Limited. It is asking the town for certain concessions.

Hamilton, Sept. 22.—Yesterday Wm. Mulliss, publicity commissioner, announced that the Canada Steel Company would locate a steel mill in this city and that work in constructing it would start at once. It will cost $400,000 and employ about 300 hands. The company was organized by Toronto and Montreal financiers.

MANITOBA.

Winnipeg, Sept. 22.—O'Grady & Anderson, brokers, announced yesterday having completed the sale of the Cardill coal property at Edmonton for $300,000, the members of the purchasing syndicate wish their names withheld.

BRITISH COLUMBIA.

Nelson.—H. Y. Anderson, of Anderson Brothers, owners of the controlling interest in the Beatrice silver-lead mine between Camborne and Ferguson, left on September 21st for Camborne, his mission being to place a crew of men at work preparing the mine for re-opening. In addition to getting things in shape, the men will sack about 600 tons of ore now on the dump, in anticipation of the rawhide season. In due course, mining operations will be resumed on a large scale.

Nelson, Sept. 21.—Interest has been aroused in the Creston district by the discovery of placer gold deposits in the bed of the Goat River. Ira Beam, an old-time prospector and gold miner, who has passed through some of the greatest gold rushes in Western America, including the stampede to Nevada, is the discoverer of these claims.

Nelson.—That the Mother Lode and Clyde-Belt mines of the Sheep Creek gold camp are continuing to push development aggressively, by new cross-cut tunnels, is the latest news from that camp. In the case of the Mother Lode, William Watson, general manager, is now driving a cross-cut tunnel from a point slightly upcreek from the recent working to come under the old workings and tap the vein. It is about at the level of No. 2 tunnel. Good headway is being made with this tunnel, and the vein ought to be reached in a short distance. The Mother Lode, like the other leading properties, is focusing its energies on development, and no ore is being shipped, as it is the intention of John McMartin, owner of the property to equip the property with a mill this coming winter. Ever since Mr. McMartin has had the Mother Lode, it has been a question of straight tunnelling to crosscut the vein at successive levels and drifting to block out ore. Less than two months ago No. 5 tunnel crosscut the main vein, on which are all the principal workings, at a depth of 380 feet.

Victoria. Sept. 21.—Mr. W. Fleet Robertson, provincial mineralogist, has just returned to the capital from the second of the field expeditions of the present season, the mineral areas of the Lillooet district being on this occasion the scene of official investigations.

The provincial mineralogist and his party went in by way of Lytton to Lillooet, and thence ascended the Fraser River to the mouth of the Bridge River, following it up the north fork from the point where a formidable canyon forbids further progress. The north fork was held almost to its source and the mountain then crossed to the headwaters of Big Creek, where some promising claims at an elevation of approximately 7,000 feet came under examination.

From this point Mr. Robertson and his party crossed another summit to Tyaxon Mountain and proceeded down Alexander Creek to Bridge River, which was followed to Cadwallader Creek, the various embryo mines of the district being visited. A crossing was next made of the summit, and the party came down to the headwaters of McGill Creek, which was followed

to Anderson Lake, all the mines of that section being taken in by the way. Thence the route lay westward to the end of Anderson Lake, where Mr. Robertson and his associates picked up the Old Caribou road, used by the inbound miners before Ashcroft and the present day connection by that point had an existence.

MINING NEWS OF THE WORLD.

UNITED STATES.

Douglas, Ariz., Sept. 16.—Construction work is now going on at both the Copper Queen and Calumet and Arizona plants. At the Calumet and Arizona the flue-dust chamber is being considerably extended to accommodate the increasing capacity of the furnaces. The furnaces at the Calumet and Arizona now consist of three 500-ton and three 300-ton. Two of the large furnaces were originally only 300-ton capacity and were enlarged. It is the intention to make all the Calumet and Arizona furnaces of 500-ton capacity by rebuilding the three smaller ones. Material for the enlargement of one of these has now been ordered and the necessary extension of the foundation and other preparations for this work are now in progress. Some time ago plans were perfected for a new stack at the Calumet and Arizona, which will be needed before the output can be materially increased. This work has not yet been started, but is likely to be in hand in the near future.

San Francisco, Cal., Sept. 17.—The statement of the dividend disbursements for August, 1910, of California oil companies listed on the San Francisco Stock Exchange, have just been compiled by Frank C. Devlin, assistant secretary of the oil securities department of the exchange. This statement shows that thirty companies paid to stockholders the sum of $1,069,917.45 during the past month.

Central City, Colo., Sept. 22.—Another concentrating plant is to be erected in Black Hawk to treat custom ore and construction has been started by the Denver Milling & Reduction Company. The capacity of the plant is to be 100 tons daily, and it is expected to be in operation within two months.

Illinois.—Since January, 1908, the stocks of crude oil in the Illinois oilfields have been gradually increasing, and now have reached the record of almost 30,000,000 barrels. Last January they were 28,400,000 barrels; in January, 1909, they were 25,000,000 barrels, and at the commencement of 1908 the stocks stood at 14,000,000 barrels. A large increase in the production of the Illinois fields is recorded owing to the bringing in of several good producers.

Washington, Sept. 16.—The Klondike placer mining district in Alaska has produced $150,000,000 in gold since 1898, and mining experts estimate the amount yet to be mined will equal that already produced. Consul Cole, of Dawson, states that the gold output for 1910 will exceed that of 1909, when more than three and one-half millions was produced. Most of this gold, he states, was shipped to the United States. A small quantity went to the new Canadian mint. Consul Cole reports that rich deposits of copper ore have been discovered in the southern part of the Klondike district.

MEXICO.

Guanajuato, Mex., Sept. 20.—Guanajuato bullion and concentrates, judging by the last report, which is about an average, are piling up a total weekly value of $28,000, of which high grades and concentrates sent to the Aguascalientes smelter run to $146,000, leaving $135,000 as the value of bullion in bars handled directly by the Guanajuato banks and sent to the Mexico City refinery. A force aggregating nearly 500 men is engaged in development at San Cayetano, Guanajuato, where the Mejiamora has been unwatered and is being retimbered.

The Mexican Eagle Petroleum Company, which owns an exclusive concession granted by the Federal Government to explore and develop for oil the lagoons and rivers along the coast, will begin work of boring wells in Lake Tamiahua. This body of water has a depth of three to four feet. It extends from a point near Tampico, south nearly to the Tuxpam River, its length being more than 75 miles and its width four to six miles. It was upon the western border of this lagoon that the great well, which was destroyed by fire, was brought in by Messrs. S. Pearson & Son, Limited, three years ago. The Tampico-Tuxpam intercoastal canal passes through this lake.

Mexico City.—The Candelaria group of mines, situated about three kilometres from the town of Ahualulco, on the San Marcos branch of the National Railways in the State of Jalisco, have been purchased by J. B. Shale for a New York syndicate from Kirby Thomas, mining engineer of New York, and E. L. Porch, of San Antonio, Texas. The price is not mentioned. The new owners also own adjoining property and are beginning development under the superintendence of W. C. Leninger, who was connected with the Amparo Mining Company. It is planned to erect a mill as soon as the old workings are well reopened.

SCOTLAND.

It is announced that further boring operations on the new shale deposits located by the Pumpherston Oil Company, Limited, in the neighbourhood of its Seafield works have confirmed earlier expectations as to the importance of the discovery. The bores have served to prove a considerable area, and there is good reason for believing that the deposits are of much wider extent. So far as proved, the bed is of good workable thickness, and the quality is that of the well-known Pumpherston shale, which is famous for its richness. Mines are being sunk on the seam as rapidly as possible, but, of course, several months must elapse before the actual raising of the shale can be begun. The new discovery will prove a valuable addition to the shale resources of the company.

FRANCE.

Paris.—The usually well-informed Moniteur Des Interests Materieles sums up briefly what European financial people have been lately saying of the proposed international copper trust. The project, which was supposed to have been definitely abandoned last spring, is to be taken up this autumn again, so the story goes now, in virtue of an understanding arrived at between the Amalgamated Copper Company, the Guggenheims and the Rio Tintos Corporation. The known presence together in Europe of the interested parties has naturally been taken as a prelude to these reports. The capital of the new combination is said to be $200,000,000, but, as this represents the value of only a single year's production in the United States alone, it is added that "special arrangements" are to be made in America to eke out this enormous but insufficient capital. One Paris financial critic announces that the news of this understanding has come out just in time to help Americans get rid of a part of their superfluous stock of copper. For the rest, it remains to be seen whether this "copper story" is or is not eventually to go the way of its predecessors.

AUSTRALIA.

Melbourne, Sept. 13.—In the Victorian Legislative Assembly to-day a motion, brought forward by Mr. Murray, the Victorian Premier and Minister of Labour, in favour of the appointment of a wages board for coal miners was carried without a division.

A deadlock, followed inevitably by a strike, is threatened in the New South Wales coal mines. The consequences will be most serious.

SOUTH AFRICA.

Johannesburg.—Despite one or two poor crushings due to exceptional conditions, the August returns from the Witwatersrand mines made a good showing, and the aggregate profits of the controlled undertakings at £967,000 represent a record for the year. The position of the companies keeping gold in reserve is also an improving one, the total of 47,634 ounces now held being the highest this year. The expansion in output has been pretty general, the outstanding features being the results obtained by the Rand mines and Gold Fields groups.

COMPANY NOTES.

The directors of the Lake Superior Corporation, in issuing their annual report for the fiscal year ending June 30th, 1910, state that the result of the year's operations of all the subsidiary companies of the Lake Superior Corporation shows a surplus, subject to depreciation and other charges, of $1,194,735.22.

The output of the steel plant, as compared with the previous year, is as follows:

	1908-9	1909-10
Pig iron, tons	130,268	153,528
Steel rails, tons	158,465	201,615

The report, by Mr. T. J. Drummond, gives the following in regard to the Helen mine:

"This company owns and operates the Helen mine. Heretofore considerable tonnage of Helen ore has been sold annually to outside firms, and considerable profit realized therefrom. Your directors, however, felt in view of the increasing requirements of the steel department that it was inadvisable 'for the present to continue the sale of this ore, which is especially suitable for our own requirements. All sales of Helen ore to outside firms have therefore been stopped, and, while this has meant a reduction in realized profits to the mining department, as also in returns to the Algoma Central Railway, we feel confident that this unsold ore lying in the mine will prove a more valuable asset than possible profits from sales meantime.

"We have also been endeavouring to ascertain, as far as possible, the extent of the ore deposits in the Helen and adjoining properties, beyond the proving and development work already completed, and in this connection the board has obtained a report from Dr. John E. Hardman, S.B,. M.E., of Montreal, which is regarded as eminently satisfactory."

The pulp mill produced 29,107 tons of ground wood pulp during the year.

With regard to new installation, the report has the following:

"As you are aware, this has been essentially a construction year. New and extensive installations are being made, especially in connection with the steel plant. We have had the usual delays and disappointments in regard to dates of completion, but the work is progressing favourably and in a workmanlike manner. We naturally have not received any results from these new installations as yet, and are not likely to obtain very much benefit before, say, the spring of 1911, but from then on the economies that will be effected in operation and the increase in output should add very materially to our net earnings.

"These new installations include a blast furnace with a rated capacity of 400 tons per day, a 12-inch and an 18-inch merchant mill, a complete installation of by-product coking ovens with sufficient capacity to care for our immediate needs in the matter of coke, a new gas blowing engine system, which will care for all our blast furnaces and create sufficient surplus power to operate the new Merchant Rolling Mills.

"Our open-hearth department will also be extended. Further provision has been made for the handling of coal and ore, etc., by additional docks and coal and ore-handling machinery of the best and most economical type. When this work is completed the directors confidently believe that, so far as the steel department is concerned, the plant will be unsurpassed in efficiency by any on the continent.

"Your directors, in pursuance of their policy of securing to the Steel Company an adequate supply of raw materials, have, during the year, added to the company's limestone properties by the purchase of the Fiborn limestone quarry in the State of Michigan, which quarry contains sufficient limestone of a high fluxing quality to last for an indefinite period.

"Your directors have also recently acquired, and are now operating the Cannelton Coal and Coke Company, which owns nearly 6.000 acres of coal lands in West Virginia."

CANADA IRON CORPORATION.

Recent reports of the year's operations of the Canada Iron Corporation were misleading in that no explanation was made of the fact that it was a period of construction with the company, and that the new plants under way were not sufficiently advanced to be productive.

The president, Mr. T. J. Drummond, in his report, pointed out, however, that the fixed charges, including interest on bonds paid and accrued to May 31st, had been cared for, leaving a surplus of undivided profits carried forward of $149,427.01.

The president also pointed out that the sales department had secured a larger volume of business than the year before, and concluded with the statement that the general showing was very gratifying in the face of the unavoidable interruption to operations that occurs during the construction period.

During the year which ended May 31st, the following work was achieved: New blast furnace at Midland, Ont.; new pipe foundry at Three Rivers, Que.; docks and terminal facilities at Port Wade, N.S.; docks and terminal facilities at Newcastle, N.B.; Northern New Brunswick and Seaboard Railway, 20 miles; developed and equipped mines at Bathurst ,N.B.; developed iron mines at Torbrook, N.S.

In addition to this, the company did considerable work on the foundry plants in Ontario, Quebec and Nova Scotia.

The company's prospects are regarded as very satisfactory, and in the current fiscal year gratifying earnings are inticipated from the new plants.

The usual semi-annual dividend of 3½ per cent. was declared on Dominion Steel preferred. It is payable October 1st to holders of September 17th.

DIVIDEND ON TRETHEWEY.

The Trethewey mine has declared a dividend of 10 per cent., being their first payment this year. Last year 25 per cent. was paid in two payments toward the end of the year. The present dividend is payable October 15th to shareholders of record September 30th.

KERR LAKE REPORT.

Kerr Lake report for fiscal year ended August 31st, shows: Total income, $1,528,983; increase, $146,693. Dividends paid, $1,050,000; increase, $550,000. Surplus, $148,220; decrease, $480,827.

STATISTICS AND RETURNS

DOMINION COAL.

The shipments of the Dominion Coal Company for the year show a very substantial increase over 1909, as is indicated by the following figures:

Shipments, 8 months, 1910	1,972,344
Shipments, 8 months, 1909	1,701,362
Increase, 1910	270,982

CONSOLIDATED FIGURES FOR AUGUST.

The Consolidated Mining & Smelting Company's statistical statement for August, 1910, is as follows:

Metals Produced.

Gold	10,194 oz.	$207,801
Silver	175,286 oz.	93,780
Copper	346,944 lbs.	43,331
Lead	2,787,301 lbs.	75,285
Total gross value		$420,197

	Per cent.
Value of gold	49.5
Value of silver	22.3
Value of copper	10.3
Value of lead	17.9

ON TIME

One of the most important business transactions which sensible minded men should perform on time is that of making proper provision for those who are dependent on them for the necessities of life.

The only way to do this is by means of life insurance. The only way to do it on time is to act now while in health. The most satisfactory way is to insure at once in the

NISSEN STAMP MILLS

Will Save 50% of Your Power.

Owing to the maximum crushing efficiency secured, the power required to operate Nissen Stamp Mills is about half that of other mills of the same capacity output.

The Nissen Stamp in Cobalt

Read what a Supt. writes:

NORTHERN CUSTOMS CONCENTRATORS, LIMITED.
COBALT, ONT., December 31st, 1909.

The Canadian Fairbanks Co., Toronto, Ont.

Dear Sirs:—

In answer to your inquiry regarding the NISSEN STAMPS supplied by your firm. These stamps are running steadily on some of the hardest rock on the Continent, they are crushing 5.3 tons of ore per head in twenty-four hours. The feed rolled down to go through about a one inch hole. The screen used for the above tonnage was 30 x 30 mesh, 28 gauge wire, opening .018, With a coarser screen the tonnage would of course be larger.

The shoes and dies wear even, and the splash is well distributed over the screen.

The arrangements for keeping up the weight of the stamps is very good.

I can recommend the Stamps. Yours truly, (*Sgd.*) F. J. Bourne, Superintendent

Want Advt.

Mining Engineer, technical graduate wants position with Coal Co. in Western Canada. Experienced Surveyor, Assayer and Draftsman. Unmarried, age 26. Low initial salary, no objection if chances are good.

Address, Box 653,
Oshawa, Ont.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price,

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE FOLLOWING GEOLOGICAL MAPS HAVE BEEN RECENTLY ISSUED:—

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1025. Waverley Sheet. Scale 1 mile to 1 inch.
1037. Windsor Sheet. Scale 1 mile to 1 inch.

QUEBEC

1079. Geological and Topographical Map of St. Bruno Mountain, Chambly Co., Que. Scale 800 ft. to 1 inch.

ONTARIO

1076. Gowganda Mining Division. Scale 1 mile to 1 inch.
1061. Explored routes in a portion of North Western Ontario, traversed by the National Transcontinental railway between Lake Minnitaki and Lake of the Woods. Scale 4 miles to 1 inch.

ALBERTA

1032. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland. Scale 400 feet to 1 inch.
1004. Geological Sheet, Rossland Mining District. Scale 1200 feet to 1 inch.
1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1105. Map No. 4A. Geological—Golden Zone Mining Camp near Hedley, B.C., by C. Camsell. Scale 600 feet to 1 inch.
1106. Map No. 3A, Geological—Mining Claims on Henry Creek near Hedley, B.C., by C. Camsell. Scale 800 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1041. Geological Map Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of the ore bodies of the same belt.
1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.
973. Catalogue of Canadian Birds, by John Macoun and James M. Macoun.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotland Part I, Economics, Part II Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon and Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
980. Report on a portion of Algoma and Thunder Bay Districts, by W. J. Wilson, and on the region lying north of Lake Superior between the Pie and the Nipigon Rivers, by W. H. Collins. A map showing the geology along the water courses from Lake Superior to the Albany River and from Missinabi to Nipigon River accompanies the report.
1075. Report on the Gowganda Mining Division 1908, accompanied by a map, by W. H. Collins.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.

YUKON and NORTH WEST TERRITORIES

1050. Whitehorse Copper Belt, accompanied by maps, by R. G. McConnell.
1097. A Reconnaissance across the McKenzie Mountains on the Pelly, Ross and Gravel Rivers, Yukon and North West Territories, with map, by Joseph Keele.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Book Dept. CANADIAN MINING JOURNAL, *Confederation Life Building* TORONTO

Geology Applied to Mining

By Josiah Edward Spurr, A.M.

Mining men, prospectors, investors and students have found this book a treasure house. It is a plain, simple, straightforward application of economic geology to mining problems. It is a concise summary of the principles of ore deposits for the man who wishes to exploit them. It isn't *geology*, but *geology as applied to practical mining.* It boils down the abstract science for the practical mining man and student—the processes of deposits, the arrangement of stratified rocks, igneous rocks, structures, placers, chemical geology, etc., etc.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Westinghouse

Type "H" Oil Circuit Breakers

Made in Two, Three and Four Pole Styles.

Although specially designed for industrial, mining and general motor applications being placed in any position convenient to the motor, they are also adapted to switchboard mountine. Type "H" Breakers can be used on both alternating and direct current circuits, and have a maximum capacity of 100 amperes at 500 volts. Their calibration range is from 80 to 160 per cent. of rated carrying capacity. While automatic in action it can be tripped by hand by means of a small lever on the side of the case.

NOBEL GELIGNITE

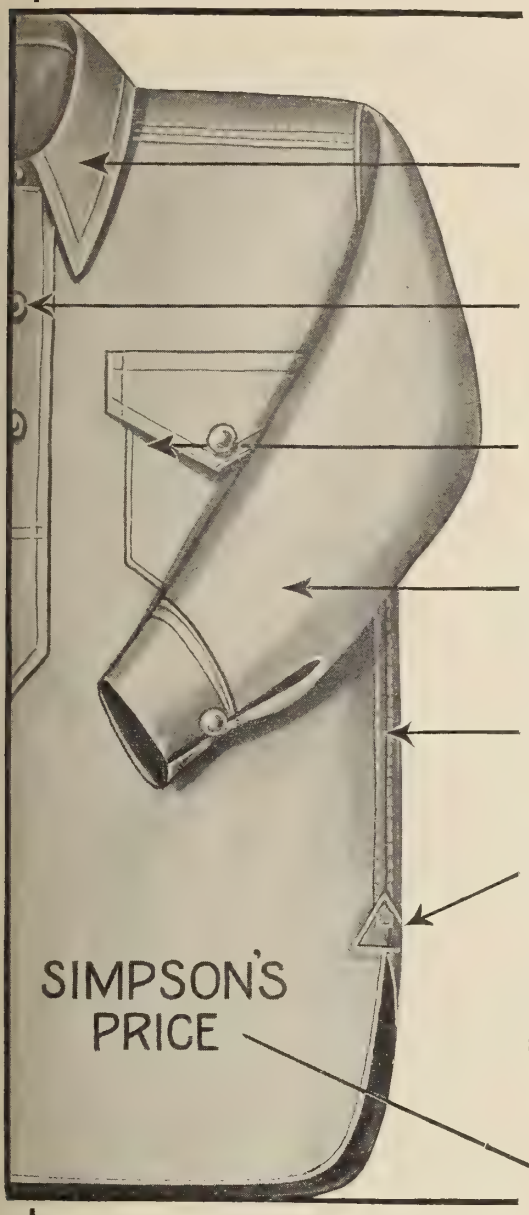
It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.



PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

KHAKI DUCK SHIRT

For Miners, Lumbermen, Prospectors, Surveyors

MADE THE SIMPSON WAY

NOTE THE DIFFERENCE FROM THE ORDINARY WAY:—

COLLAR will fit neatly, all ways, all the time. Is well interlined to retain its shape. Steels inserted to prevent curling points.

DOME FASTENERS of brass used throughout. No buttons to come off. No occasion to swear. A feature that will be appreciated by every man.

POCKET Two pockets, one on each side, with dome fastened flap. A splendid idea. Plenty of *pocket space* is a Simpson improvement.

SLEEVES are made large. Plenty of elbow room. Inter-lined wrist-band, dome-fastened. One of the strong points not to be overlooked, viz.—roomy sleeves.

DOUBLE STITCHED seams throughout, with extra strong thread insuring strong wear. This Simpson shirt is made stronger to wear where the most wear comes.

GUSSETS are made strong and double stitched, adding extra strength. You can be absolutely sure the seams will not rip at this point.

FABRIC extra heavy khaki duck. Wind-proof and shower-proof. Will stand the hardest kind of wear. Try it. Almost indestructible.

"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just because it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be the stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we **know**, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs **per year** than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line, As you have everything to gain and nothing to lose, why not investigate NOW?

BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

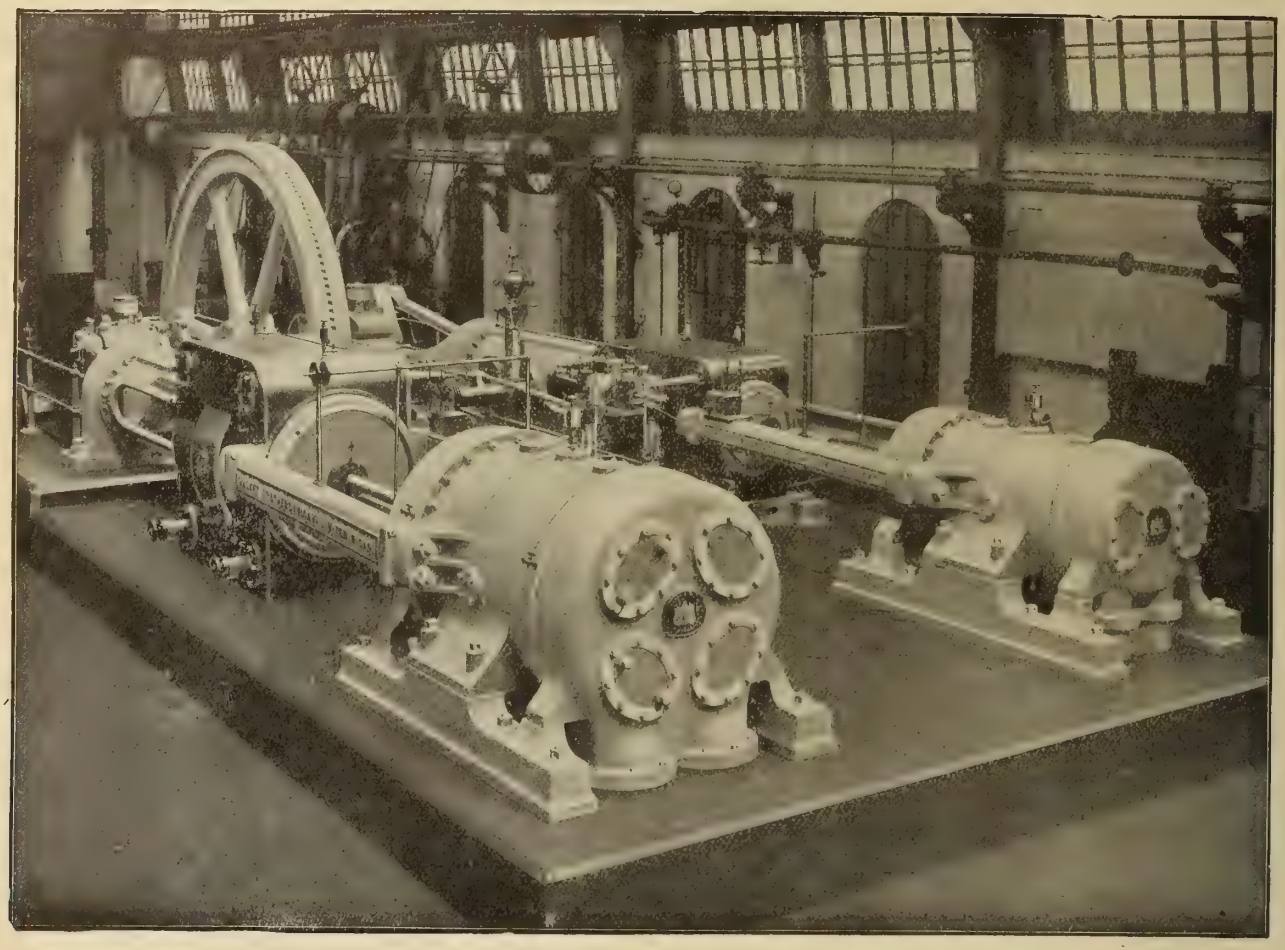
CYANIDE HANDBOOK BY J. E. Clennell

Over 500 pages, 6x9, illustrated, $5.00 (21s) net, postpaid



Mr. Clennell has been in close touch with the rapid developments of cyaniding. He has been instrumental, too, in many important discoveries, and his work in this field has taken him to the leading plants of the world. It deals generally with Cyanide and does not confine itself to the process alone. It is divided into nine main parts covering the subject more fully and exactly than it has heretofore been handled.

Especially noteworthy is the full treatment of recent developments and important phases heretofore *inadequately treated.*

The Davis Handbook of the Cobalt Silver District

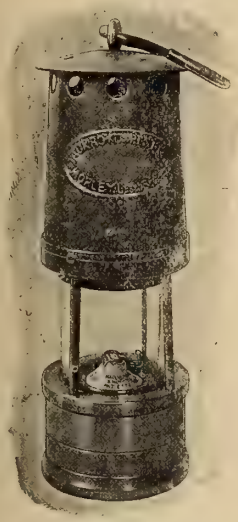
by H. P. Davis

Illustrated with Photographs

PRICE

Paper Cover = = $1.50

Stiff " = = = $2.00



¶ The first section of this volume is an outline on the Goelogy, Mining Treatment and Marketing of the Ores of the Cobalt District, the object being to give all the data and general infromation necessary to guide investors, brokers and professional men generally.

¶ Included in this volume is a complete and accurate directory of all mining companies operating or organized to operate in the Cobalt Silver District of Ontario.

¶ Full information as to capitalization, directorates, locations and conditions of properties is given. Tabulated statements of production and dividends revised up to January, 1910, are included.

AMALGAMATED ASBESTOS.

Destructive criticism of established industries is no part of our aim. When, about eighteen months ago, the Amalgamated Asbestos Corporation, Limited, was organized with a total capitalization of $25,000,000, the CANADIAN MINING JOURNAL drew immediate attention to certain unhealthy features. Amongst the points that we dwelt upon were the overcapitalization of the company, and the extravagant nature of the statements made by the promoters. Our criticisms were not well received. Several newspapers were loud in their counter cries. These same newspapers are now equally loud in their condemnation of the action of the Amalgamated in passing the last dividend and in issuing a future call upon the underwriters of the bond issue. Violent communications are appearing almost daily in columns that were once devoted to exploiting the merits of the whole scheme.

Now we have no intention of adding our voice to the chorus of the discontented. In fact our advice to them is to sit tight and look squarely at conditions as they are. Nothing can be gained and very much may be lost by disturbing the peace now. The reasons are apparent.

In the first place, whilst it is admitted that Amalgamated Asbestos has been over-financed, there is no question that physically the properties are in much better shape than ever before. Economies large and small have been effected. Mechanical equipment has been enlarged and improved. Mill products have been standardized, and every effort is being made to extend the market. We believe, also that in general the administration has been rendered much more efficient and much less expensive.

However painful to the shareholder may be the absence of a dividend, we are firmly convinced that payment of that dividend would be exceedingly bad business. In the early stages of any such huge enterprise it is unwise to begin disbursements. The Amalgamated is not yet two years old. For some time yet all earnings should be returned to the mines and plants.

While we do not for a moment wish to pose as an apologist of the promoters, yet we must say that we feel no sympathy whatever for those who are trying to block the present management in its attempt to make the best of a difficult situation, a situation created in part by the highly-coloured representations of a specialist who was an accredited officer of the Federal Mines Branch.

The future of Amalgamated Asbestos depends altogether upon close and efficient management and upon unremitting attention to the development of the market. We see no reason why that market cannot be greatly enlarged. But the process of securing new consumers

is long and costly. Hence shareholders should be content to dispense with dividends until such time as they can be paid without injury to the business.

The present condition of the market has been induced by the unwise desire to make a fine showing. Over-production has adversely affected prices. It is certainly not yet possible to market the present outputs. How soon it will be possible is a matter of conjecture. And this is the crux of the whole question. Over-production is a costly expedient. It is not worth while. The time has come to lend every energy to mining, milling, and marketing. Of these three the last named is, just now, by far the most important.

Greatly overdone as has been the amalgamation of Canadian enterprises, it is wrong to condemn sweepingly the principle of consolidation. Consolidation without the injection of superfluous water brings many and decided advantages, especially in such an industry as asbestos mining. Amalgamated Asbestos had more than a fair injection. But the water is there and must remain there until removed by catastrophe or by gentle evaporation. The latter method is to be preferred.

THE NINETEENTH ANNUAL REPORT OF THE ONTARIO BUREAU OF MINES.

Part I. of the Nineteenth Annual Report of the Ontario Bureau of Mines has just come to hand. It contains the usual exhaustive and clear statistical review from the pen of Mr. T. W. Gibson, Deputy Minister of Mines. Mr. E. T. Corkill, Inspector of Mines, reports upon and analyses in close detail the mining accidents that occurred during 1909. Mr. Corkill also reviews the mining operations of the year and the development of water powers in mining districts.

The Kent gas field is the subject of a short paper by Mr. G. R. Mickle, Mine Assessor. Mr. G. C. Mackenzie continues his valuable researches in the concentration of iron ores. His present contribution "Concentration of Low Grade Magnetites," contains several exceedingly useful treatment determinations on Ontario ores. Mr. Mackenzie's general conclusion is that the process of magnetic separation is well worthy of serious and immediate consideration by operators in this province. This conclusion is based upon continuous and systematic investigations covering several years.

Dr. E. S. Moore writes of the Lake Savant iron range area. Although no rich ore has been encountered here as yet, Dr. Moore expresses the opinion that the range is worth prospecting.

"Nepheline Syenites of Port Coldwell" is the title of the concluding paper, of which Mr. H. L. Kerr is the author. This is an academic dissertation upon the petrographic characteristics and the geologic associations of the above mentioned rocks.

The Nineteenth Annual Report is profusely illustrated and is accompanied by three coloured geological maps, —respectively, of Lake Savant Iron Range, District of Thunder Bay, and Porcupine Gold Area—and one map profile from Toronto to the Archean-Palaeozoic boundary on the Hudson Bay slope. Along with the Porcupine map are several detail maps.

Our readers will welcome the announcement that Part II. of the Annual Report, which will appear later, is to consist of a revision of Dr. W. G. Miller's classic Report on the Silver Regions of Northern Ontario. This will not only be brought up to date, but will also be much more comprehensive than before. South Lorrain, Montreal River, and Gowganda will be dealt with in addition to Cobalt.

. . . . .

In several respects we notice improvements in the Ontario Report. The illustrations are well chosen and more numerous than heretofore. The statistical tabular statements are more complete. Particularly is this the case in Mr. Corkill's painstaking summary of mining accidents. The review of mining is creditably complete considering that this work also falls upon Inspector Corkill's shoulders. In fact, the whole volume is instructive. But we must once again express our conviction that it is foolish and futile to throw the inspectoral work of the whole of Ontario upon one individual.

There is no room to doubt the past and present need of more rigid inspection. It is a physical impossibility for one man to cover Ontario adequately. It is also most unjust to expect any faithful and competent officer, —and both of these adjectives apply to the present inspector— to cover, in detail, a field like Ontario. The province can well afford to appoint a staff of paid assistants for the work.

MINING ACCIDENTS IN ONTARIO DURING 1910.

The Ontario Bureau of Mines Report for 1910, referred to generally in another column, deals more thoroughly than usual with mining accidents.

We note in reading the inspector's report that 34.7 per cent. of the fatalities are classified as resulting from accidents due to danger inherent to the work itself; 10.2 per cent. from accidents caused by defects in the mine workings; 8.2 per cent. from accidents through fault of fellow workmen; 40.8 per cent. due to accidents through fault of injured persons. The remaining fatalities, 6.1 per cent., are not susceptible of classification.

According to this analysis, at least 59.2 per cent. of the fatalities that occurred during 1909 were preventible. In other words they were due to carelessness on the part of workmen, or to negligence on the part of operators. But the latter is not seldom a contributory cause. And whilst it is impossible to prevent carelessness altogether, it should be quite practicable to reduce it to a minimum. It is not appropriate here to discuss the proportion of blame that falls upon the operators. But we can assert without fear of contradiction that accidents would have been fewer had the operators done their whole duty.

During 1909, Ontario's mining industry grew notably. It is growing every day. Much new territory is being opened. Hence the newer districts are dotted with numerous small workings. Inspection of these is difficult, but absolutely necessary. And regular inspection of all established mines is equally essential. A toll of 49 lives is too large. The annual expenditure of a few thousand dollars in salaries for assistant-inspectors would be amply justified if but two or three lives were saved; but it is probable that the decrease in fatalities would be larger than this.

Nothing but praise is due the work being done at present. The potent truth is that there should be provision made for ten times more of it. This is not the first time, nor shall it be the last time, that we shall refer to this question. We hope that when next we touch upon it, however, it will be to congratulate the Government of Ontario on augmenting its absurdly small appropriation for the inspection of mines.

COAL MINING IN ALBERTA DURING 1909.

Somewhat belated is the Annual Report of the Coal Mines Branch of Alberta. Nevertheless it is highly interesting.

According to figures here presented the output of coal in 1909 was 2,174,329 tons, an increase of 17.85 per cent. over 1908. This increase would have been still larger had not three-quarters of the production been shut off for three months owing to strikes.

Since 1905, Alberta's output has multiplied by three. There are now 121 operating mines, of which 32 were opened during 1909. During that year, also, eight mines were abandoned.

The quantities of lignite, bituminous, and anthracite mined during the past year were respectively, 763,673 tons; 1,197,399 tons; and 213,257 tons. The production of coke was 87,812 tons; and the production of briquettes, 89,785 tons.

The average number of persons employed underground was 3,893; whilst the average number employed overground was 1,314. The total fatalities numbered nine, two overground and seven underground. It is pleasing to note that the number of fatalities is smaller than ever before in proportion to the number of tons of coal mined. In 1908, there was one fatal accident for each quantity of 167,721 tons mined. During the past year 241,592 tons were mined for each life lost. This improvement is directly attributable to the installation of safety lamps and to the use of permitted explosives.

The Report includes a record of additions and improvements to existing plants, and brief notes regarding new ventures. It also presents a useful directory of operating companies. The concluding pages give the examination papers for managers', fire-bosses', and pit-bosses' certificates.

EDITORIAL NOTES.

The Commonwealth of Australia is providing for a note issue of £7,000,000. Against this issue a gold reserve of 25 per cent. is to be maintained. Issues beyond the sum mentioned must carry a gold reserve of 100 per cent.

The Montreal Herald, for October 1st, contains a most readable account of the Timmins mine, Porcupine. Mr. Alex. Gray is the author.

Mr. F. A. Sundt, professor of metallurgy, University of Chile, Santiago, is the author of an exhaustive monograph on mining and metallurgy in Chile. Mining engineers who can construe Spanish will find this monograph most instructive.

Mining and Scientific Press makes the suggestion that mining engineers follow the example of doctors and develop a system of small fees for office consultations. Difficulties beset any such attempts. Yet we are persuaded that in the hands of decent professional men, some such idea could be realized. Once put into practice it would eliminate the importunate questioners who are forever seeking free advice.

In the opinion of Mr. George E. Collins, expressed in a lecture delivered at the Colorado School of Mines, the virtual abandonment of contract work in Gilpin County mining resulted in a marked decrease in the average efficiency of labour, and a corresponding increase in the cost of mining. The advance in daily wages, and the increase in cost of living, have affected mining costs relatively little.

Next year's meeting of the International Geological Congress is to be held in Canada. The Dominion Government, and the Canadian Mining Institute have joined in extending invitations. Would it not be seemly for Nova Scotia, Quebec and British Columbia to go and do likewise.

A correspondent informs us that the mineral exhibit at the St. John (N.B.), Exposition was in no sense representative. It appears that the provincial government could not see its way clear to spend a respectable amount upon the exhibit. Until this unprogressive attitude is changed, New Brunswick, despite her known mineral potentialities, will remain dormant.

Our Prince Rupert, (B.C.), exchanges show the same symptoms that broke out in Toronto papers when Cobalt was young. Shrieking brokers' advertisements of mining shares are making their appearance. We deprecate these yellow spots.

The extent to which taxation of industrial concerns is carried in Germany is indicated in a recent consular

report. In one instance quoted, an iron manufacturing company pays 33 per cent. of its dividend (formerly paid entirely to its shareholders) to the government. Nineteen per cent. the government devotes to sickness—accident—and invalid-insurance. The remaining 14 per cent. is paid as government taxes. In the case of the Krupp Company, a sum equal to 93 per cent. of its dividend is appropriated by the government. We wonder how this system would work in Canada!

The British Columbia mineral exhibit, now being displayed at Spokane, is probably to be made a permanent feature. This will do away with the constant loss of money, effort, and material that ensues when the collection has to be gathered afresh as occasion requires.

CANADIAN MINING INSTITUTE.

Election of Officers and Council, 1911.

The attention of members is called to Section 32 of the by-laws, which reads as follows:

32. "Not later than the 1st of November of each year the secretary shall notify all members of offices falling vacant at the end of the next annual meeting, and call for nominations to such offices. The list of such nominations shall close on January 1st following. All nominations for offices shall bear the signatures of not less than ten members in good standing. In the event of the secretary failing to receive nominations for all vacant offices, the council shall complete the list."

Pursuant to the above, notice is hereby given that offices as under will fall vacant at the end of the next annual meeting, March, 1911, and nominations for the same will be received by the undersigned from November 1st, 1910, to January 1st, 1911, inclusive:

President, vice-presidents (2), councillors (10).

The retiring officers are:

President—

Dr. Frank D. Adams, Montreal, Que.

Vice-Presidents—

Dr. A. E. Barlow, Montreal, Que.

Mr. J. Obalski, Montreal, Que.

Councillors—

Mr. R. W. Brock, Ottawa, Ont.
Mr. J. Stevenson Brown, Montreal, Que.
Mr. Thos. Cantley, New Glasgow, N.S.
Mr. Arthur A. Cole, Cobalt, Ont.
Mr. C. J. Coll, Stellarton, N.S.
Mr. John Donnelly, Kingston, Ont.
Mr. H. E. T. Haultain, Toronto, Ont.
Dr. Milton L. Hersey, Montreal, Que.
Dr. J. B. Porter, Montreal, Que.
Mr. J. B. Tyrrell, Toronto, Que.

(N.B.—All or any of the retiring officers or councillors are eligible for re-election.)

The following gentlemen will continue to serve on the council for the year 1911:

Vice-Presidents—

Mr. A. B. W. Hodges, Lima, Peru.
Mr. R. W. Leonard, St. Catharines, Ont.

Councillors—

Mr. Selwyn G. Blalock, Moyie, B.C.
Mr. R. W. Brigstocke, Naughton, Ont.
Mr. Robt. A. Bryce, Cobalt, Ont.
Mr. John A. Dresser, Ottawa, Ont.
Mr. Chas. Fergie, Montreal, Que.
Mr. R. T. Hopper, Montreal, Que.
Mr. G. G. S. Lindsey, Toronto, Ont.
Mr. James McEvoy, Toronto, Ont.
Mr. J. J. Penhale, Sherbrooke, Que.
Mr. O. E. S. Whiteside, Coleman, Alta.

Including the past-presidents, who are ex-officio members of the council, it will be noted that representation by provinces, according to the above list of officers and council already elected to serve for the year 1911, will be as follows:

Quebec, 4; Ontario, 7; British Columbia, 3; Nova Scotia, 0; Alberta, 1.

The retiring officers and councillors represent:

Quebec, 6; Ontario, 5; British Columbia, 0; Nova Scotia, 2; Alberta, 0.

H. Mortimer Lamb,
Secretary.

Secretary's Office,
Rooms 3 and 5, Windsor Hotel,
Montreal, Que.
September 15th, 1910.

PORTLAND CANAL DISTRICT, BRITISH COLUMBIA.

Mr. R. G. McConnell, of the Geological Survey Branch of the Canada Department of Mines, has returned to Ottawa after having spent the field-work season of 1910 in making investigations in the Portland Canal district of British Columbia. Included in his party were an assistant geologist and a topographer, and much data was obtained for use in preparing topographical and geological maps of the area examined.

Interviewed when passing through Vancouver, B.C., at the end of September, Mr. McConnell was reported to have said:

"There is not a very large area of mineralization in the Portland Canal district, but it is yet a little premature to pass any final opinion respecting the possibilities of mining there. With only two noteworthy exceptions, most of the work done has been of a superficial character. Owners of claims have been chiefly occupied during the past season in cutting out roads and trails, prospecting the surface of their ground, and getting in supplies for the ensuing winter's operations. This preliminary work in a new camp is inevitable.

"I visited various camps and saw some promising prospects. Conditions in the Salmon River district, farther inland, are much the same as in the Portland Canal country. At Salmon River I also saw a number of good showings, but no orebody has yet been outlined or proved up. The value is principally in gold, silver, and lead. I was shown some fine specimens of gold ore, which, according to report, had been found this season across the divide, in Nass River district.

"It was unfortunate that sensational and untruthful reports about the discovery of rich free-milling gold ores on Bitter Creek, were sent broadcast last June. Such practices should be severely condemned, as they tend to injure the real merits of the country. As a matter of fact, the existence of free-milling ore on Bitter Creek has not yet been established. It is true that specimens of free gold in small quantities were found in one or two spots. Similar exaggeration took place concerning the so-called gold placers on Bitter Creek, which has been staked from end to end. If the gold is there, nobody has yet tried to get it out."

All commercial cyanide contains more or less sodium cyanide, and so-called 125 per cent. cyanide is the nearly pure sodium compound.

THE PORCUPINE TRAIL

Written for the Canadian Mining Journal by Reginald E. Hore, Houghton, Mich.

Porcupine, Ontario's newest gold camp, is 130 miles north of Sudbury and on the edge of the great clay belt. A line drawn from the mouth of Moose River, James Bay, to the mouth of the Whitefish River, Lake Huron, passes through Porcupine 200 miles from the former and 170 from the latter point.

Kelso, Mileage 222, T. & N. O. Ry. The Jumping Off Place for Porcupine.

In summer the camp is reached 43 hours after leaving Toronto on the Cobalt Special. From Cobalt to Porcupine takes 25 hours. Daily trains with Pullman service pass at Kelso, within 25 miles of Porcupine Lake, and the balance of the journey is made by stage, motor boat, canoes and afoot.

Leaving Cobalt in mid-afternoon, and stopping at Englehart for supper, you reach Kelso in the early evening, having opportunity on the way to note the extensive improvements in the Northern Ontario hinterland. The rugged scenery of the pre-Cambrian formations at Temagami and Cobalt is succeeded near Haileybury by gently sloping fields underlain by Niagara limestone. To and beyond Englehart numerous farms have been cleared and cultivated, with results that promise well for the country's future. Further north there is another stretch of rocky country, which extends eastward to Larder Lake and Quebec. Then follow clay and sand flats covered with spruce, jackpine and poplar. Beyond Kelso the steel extends across broad muskegs to Cochrane and the Transcontinental Railway, 147 miles north of Cobalt.

On The Kelso Road Showing Old Trestle Built by Tie Contractors and Now Used as Highway Bridge.

At Kelso you must jump off in the gravel ballasting,

for no platform has yet been built, and an old day coach on the siding is the station house. Fortunately, however, hotels have been built within a few paces of the rails, and here you will find a good meal and a clean bed.

The Kelso Road.

The regular stages leave Kelso for Frederick House River at 7 a.m. It is customary to occupy your seat and start with the stage, but you soon have occasion to become more intimately acquainted with the famous clay belt. The road is over remarkably level forest-clad country. The first few miles is clay, then follows a few miles of sand and a second long stretch of clay which extends to the lake. The clay is covered by only a few inches of vegetable mould, and being very poorly drained, can hardly be expected to afford a good road-bed except in very dry weather. The sand has even less cover, but is fortunately comparatively hard, and makes a good natural road. Unfortunately there is an absence of such glacial moraines as in many localities afford a supply of gravel. The clay and sand are remarkably uniform in composition, having been well sorted by and laid down in water, probably in the glacial Lake Ojibway.

Thick forest covers both clay and sand areas. The trees are small, mostly under 12 inches. Black spruce and jack pine are the most abundant conifers, though balsam, fir and cedar are plentiful in some localities. The latter, owing to lack of milled lumber, is in great demand at the camps. Poplar and white birch are conspicuous, and stand out distinctly from the dark evergreens. The largest trees, few of them over 18 inches, are the poplars.

During the construction of the T. & N. O. Railway this section was cut over for ties, and, indeed, the present highway follows, for some distance, the old road into the tie camps. A relic of the construction days is the narrow gauge tramway trestle, one-half mile west of Kelso, and which some of the teamsters now drive over rather than descend into the little valley.

On the Kelso Road—The Stage on a Newly Laid Corduroy.

Golden City. Looking Down the Main Street to Porcupine Lake.

A large portion of the country traversed by the Kelso road was burned over a few years ago. The fire was naturally more disastrous on the dry sand plain, which now presents with its blackened sticks, a very desolate appearance. The first disagreeable impression is soon dissipated, however, when you find that large patches of the ground are covered with prolific blueberry bushes.

It is two hours' journey westward along the forest-

walled road to the shore of Frederick House Lake—a sheet of muddy water lying in a shallow clay basin about twenty square miles in extent. A good natural road is furnished by the artificially exposed lake bottom, and the edge of the water is followed for about 3 miles to Crawford's Landing, at the head of the lake.

Frederick House to Hill's Landing

The stage line ends at Crawford's, and the river is ascended in gasoline launches. A run of eight miles southward is made on this gently-flowing stream, then the northwest arm of Night Hawk Lake is crossed and you ascend the Porcupine River to Hill's Landing, which is reached two hours after leaving Crawford's. To accommodate the passenger traffic there are three covered launches. Freight is carried in flat-bottomed pointers. Passengers from Kelso to Hill's are charged $3.50, and the freight rate is $1.25 per cwt.

Hill's to Porcupine.

From Hill's to Porcupine, traveller and freight go by different routes. The former gets a good dinner at the Landing and proceeds afoot, while the latter is taken up the river.

The river route is very circuitous and about 28 miles in length. The freight is taken on the motor boats to the first portage about one-half mile above Hill's; but for the balance of the trip canoes are used almost exclusively. With an average load, 1,100 pounds, in the 18-foot canoe, the trip up is made in 10 to 12 hours. The down trip takes three or four hours less. The freight rate from Hill's to Porcupine is $1.50 per cwt.

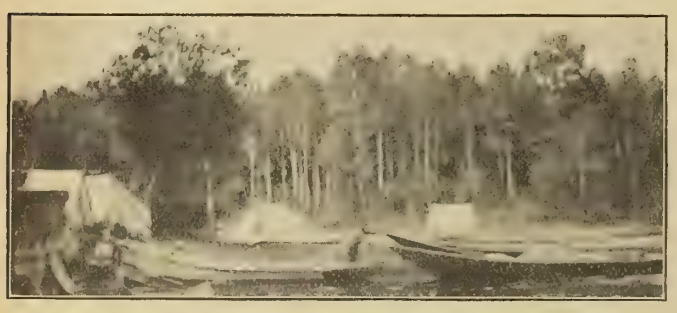
The trail from Hill's to Porcupine is about 7 1-2 miles; but fortunately, for the walking is bad, two lakes are crossed on the way, and the walk thereby shortened to about six miles.

Timmins-McMartin Mine, Porcupine, Looking East. At Right is Hollinger Dome of White Quartz

Timmins-McMartin Mine, Porcupine. The "Shake" Cover has just been put on Shaft

The first three miles to Three Nations Lake is now best made over the new government wagon road. At present it differs from the Kelso road chiefly by being uniformly bad all the way, for it is all clay, and the clay is wet. Further west a more sandy plain will be crossed, and then the two roads will be about on a par. It is unfortunate that the roads are in such condition, but little else can be expected from such materials as are immediately available.

Mine Roads



To take in supplies from Porcupine, the mine operators have cut roads across the spruce covered clay flats, and have thereby demonstrated very clearly some difficulties of transportation in the clay belt. When first cut out the roadway looks promising enough, with no steep grades to be negotiated and no muskegs to cross. After a little use and a few heavy showers, however, it is evident that the ordinary ungraded bush road cannot be relied upon even for occasional service. Once wet, the roads never become dry and firm again, and the effect of a really dry spell is but to make the clay more sticky. Under the conditions the best carrier is the pioneer's "jumper" which, loaded with but a few hundred pounds and sliding alternately in the mud and over the corduroy, quickly wears out an ordinary team. It is perfectly evident that the cost of taking in mining supplies in the summer is enormous, and in most cases should be prohibitive. The northern winters afford much more economical methods, and until steel is laid into the camp, and the clay roads dressed with crushed rock or gravel, the amount of material moved in summer will be kept at a minimum.

Power will be a less difficult problem than transportation. For preliminary operations, there is a plentiful supply of firewood and water, and the Mattagami River will doubtless be harnessed to develop power as soon as a regular demand is assured.

One of the Timmin's Veins. Miller Lake at left. Width of White Quartz about equals that of Wood Pile

As the road is not yet finished into Porcupine, it has been customary to cross Three Nations Lake and follow a trail thence to Bob's Lake. This trail runs across 2 1-2 miles of wet "clay belt" and over some small outcrops of grey schist. At the lake, as at Three Nations, a ferryman is on the lookout for passengers, and you are quickly carried across in his canoe. A mile westward on another wet trail brings you down the main street of Golden City to Porcupine Lake. It is but a few minutes' walk along the shore to the Shuniah Hotel, a remarkably pleasant stopping place at the north end of the lake. With average luck in making connections with the ferrymen, the trip from Hill's to Porcupine takes about three hours. When the road is finished, about one hour less should do. To reach any point on the lake, motor boats and canoes are available. It is a half-hour paddle from the Shuniah to South Porcupine, whence trails lead to several of the chief properties in Tisdale Township.

At Crawford's Landing on Frederick House River

Dome Mine, Porcupine, Shaft No. 1 at Left. Test Mill at Right. Diamond Drill at Left Background, on the White Quartz "dome." Shaft No. 2 at Right Background. Quartz Outcrop in Centre.

The Rock Outcrops.

The rock outcrops in Tisdale Township rise but little above the clay flats. They evidently represent the higher knobs of a pre-Cambrian area, which was almost completely covered by silt and fine sand deposited from a large glacial lake. Near Porcupine the outcrops are small and isolated; but further west and south, they are more continuous. All are low, and afford no very favourable mill sites, so that pulp will have to be handled.

Many of the rocks are more or less schistose altered volcanics of varied compositions. They range in colour from light grey to dark green, while some varieties are yellowish. Intimately associated with the volcanics are grey and yellowish schistose carbonates. The series is in many respects similar to rocks at Temagami and Larder Lake, and is probably of Keewatin age.

There are also rocks which show distinct sedimentary bands of greywacke, grey quartzite, and altered shales. These are in some instances steeply inclined without being markedly schistose; but in most instances show secondary cleavage in the sediments, and the shaly member is usually represented by a very fissile slate or a mica schist. These rocks are probably Huronian, and resemble those of Sudbury and parts of Michigan more closely than they do those of the Nipissing silver fields.

A third distinct type of outcrop is a somewhat schistose conglomerate composed of light coloured pebbles of several types set in a fine grained grey coloured matrix. The conglomerate appears to overlie the schist series and underlie the greywacke, and probably represents a low horizon in the Huronian.

The Ore Deposits.

The Huronian and Keewatin series alike are impregnated with secondary quartz. In the distinctly bedded rocks there are seams of white and grey quartz conforming to the stratification, and there are also veins which strike obliquely across the bedding. In the schists there are veins which strike across the secondary cleavage, and also other fillings which conform to the schistose structure. Some of the gold-bearing quartz masses show very decided direction, and by stripping at intervals, veins 2 feet to 10 feet wide, have been traced for several hundred feet. Others are extremely irregular in shape, and their extent is known only so far as they have been com-

On the Porcupine River

On the Road from Hill's Landing to Porcupine

Kelso Road, a Typical Spot in the Clay

pletely stripped. There is in most cases a marked association of the gold-bearing quartz with schistose carbonate wall rock, and the quartz has to some extent replaced the carbonate.

The most extensive testing in the camp is being carried on at the Dome and the Timmins-McMartin properties, both of which should be important producers next year.

At the Dome there is a large oval-shaped mass of white quartz with enclosed fragments of pyritic grey schist. The whole mass, measuring 100 by 250 paces, is being systematically sampled. The light overburden has been almost completely removed and surface samples carefully taken. At depth the testing is being carried on by exploration shafts with cross cuts at the 60-foot level and also by diamond drilling. A Nissen stamp is crushing a sample of the rock broken, and the results obtained are said to be very satisfactory. It is stated that a 40-stamp mill will be installed this winter, and the operators expect to have, before the mill is ready, an estimate of the values contained in one million tons of quartz and pyritic schist.

The Timmins property shows quite well-defined veins, and is therefore not being tested in the same way as the Dome. The veins have been well exposed by surface stripping. Vertical shafts were sunk and the deposits proved

Shovel Sampling at the Dome Mine, Porcupine. Test Mill at Left. Camp Buildings in Right Background. Quartz Outcrop in Foreground.

to be steeply inclined. A considerable tonnage of ore is now being blocked out by drifting at the 100-foot level. A two-stamp Tremain mill is being used to test the ore, which has proven to be spectacular at depth as well as on the surface. Lack of power prevents development from proceeding as rapidly as might be desired, but already a remarkable amount of work has been done.

There are in Tisdale Township a number of large veins showing free gold, and good assays have in several instances been obtained from very unlikely looking "bull" quartz. It will be remarkable if some of these do not prove producers. In most cases the exploration this summer has been by stripping, and the care with which this has been done is as remarkable as it is unusual, reflecting clearly the effect of prospecting in Cobalt camp. Without power and supplies, few operators have managed to explore their properties to any considerable depth, and the extent of the deposits is therefore not yet known.

DICTIONARY OF METALLURGICAL AND CHEMICAL MATERIAL— 219 PAGES—PAPER COVER—PRICE 50 CENTS. PUBLISHED BY METALLURGICAL AND CHEMICAL ENGINEERING, 239 WEST 39TH STREET, NEW YORK, 1910.

This convenient and time-saving little volume is a model of conciseness. It gives the reader accurate descriptions of the different makes and special features of any of metallurgical or chemical apparatus and material. A directory of manufacturers is included. Supplementary sections are headed "Measuring Instruments and Laboratory Supplies," and "Professional Directory."

The average value per ton of coal produced in Great Britain was 7s. 6d. in 1906. In 1908, the average value rose to 8s. 11d. A similar rise in value took place in all the large coal-producing countries, including the United States. In the last named country the nominal average value of coal is lower than in any other, being reported for 1908 as 5s. 11 3-4d. The average values are influenced not only by differences of quality, but by differences in the accessibility of the seams, in methods of operation, in the cost of labour, etc.

Cobalt concentrating mills have a total daily capacity of about 1,200 tons of ore. 242 stamps are dropping. The largest individual installation is 52 stamps. Concentration ratios, so far as can be determined, range from 25 : 1 to 60 : 1.

THE KENT GAS FIELD

By G. R. Mickle.

(Reprinted from Nineteenth Annual Report Ontario Bureau of Mines.)

The most interesting and important event in connection with the development of the natural gas industry in Ontario in recent years is the discovery and delimitation of this field, covering portions of the townships of Romney, East Tilbury and Raleigh. The accompanying sketch shows the field forming roughly a triangle with the base resting on the lake.

Where and How the Gas is Found

Drilling operations commenced in what is marked as "Oil Territory" on the plan in the year 1905, and the operations were pushed southwards. In December, 1906, the first well was drilled in the area near the lake, which has since proved to be productive of the wells of greatest capacity. Operations continued throughout 1907 and 1908, and by May of 1909 the limits of the field could be determined with some exactness so far as the land area is concerned. The gas-bearing rock, without doubt, however, extends some distance under the lake, and the wells of largest capacity are found not far from the lake shore.

The gas exists in the Onondaga formation (Jour. Can. Min. Inst., Vol. X., p. 82) in a dolomite rock. Usually four pay streaks are present. Thus, in three wells, which may be taken as typical of the southern or most productive part of the field, the levels at which "gas pay" was found were as follows:

		Feet Depth.
(1)	First gas found at	1,120
	Second gas found at	1,210
	Third gas found at	1,305
	Fourth gas found at	1,345
(2)	First gas found at	1,145
	Second gas found at	1,240
	Third gas found at	1,355
	Fourth gas found at	1,380
(3)	First gas found at	1,145
	Second gas found at	1,305
	Third gas found at	1,375
	Bottom of hole	1,380

The Probable Supply of Gas.

The capacity of the wells in this field is much greater than is usual in Ontario. Thus the "open flow" measurement of the wells in the Haldimand field, near Selkirk, which has not been drawn upon for long and is therefore near its maximum, averages less than 200,000 cubic feet in 24 hours. Only about 4 per cent. of the wells show a measurement of 500,000 feet or over. In the Kent field, on the other hand, a number of wells have an open flow capacity up to 7,000,000 feet, and the average of 17 wells known to the writer is about two and a half million feet.

At the present time the gas is piped to the following towns or cities, besides supplying farm houses along the lines, viz.: Chatham, about 14 miles; Windsor, about 45 miles; Sarnia, 55 miles; Blenheim, 14 miles; Ridgetown, 23 miles; Tilbury, Merlin and several other smaller places on the way to Windsor and Sarnia. In all, something like a population of 50,000 people is served by natural gas from this field.

The Factors of Supply

The question naturally arises, How much gas will be produced here? The quantity of gas depends on four factors, viz.:

(1) The area over which the gas-bearing rock is found.

(2) The average aggregate thickness of gas-bearing rock.

(3) The rock pressure.

(4) The amount of pore space in the rock.

With regard to the area, as the field is fairly well delimited, and practically no dry holes are found, this can be calculated. In measuring this, as all the evidence points to the gas-bearing rock extending some distance under the lake, a line was drawn parallel to the shore line one mile out in the lake and this was included in the gas area shown on plan. A planimeter was then used to measure the area. It proved to be 34.6 square miles. The chances are greatly in favour of the field extending further than this under the lake, and later on when the pressure drops, as the supply of gas diminishes, this gas will find its way in, as it is inconceivable that there could be a pressure of say 50 pounds or less on the land area, and 600 pounds in the same strata of rock under the lake. The figure arrived at below, therefore, is probably too small. It cannot be too large.

The second factor, the average thickness of gas-bearing rock, can be approximated by observations taken in drilling, and noting by measurements of the flow of gas from time to time how much this increases as the hole advances. Thus a layer of gas-bearing rock will be struck and the flow measured every foot, say, till the measurement is constant. There will then be no further increase of the flow till another pay streak is struck. The aggregate thickness of these layers has been taken as 10 feet, which is a safe estimate given by drillers.

The third factor, the rock pressure, is measured direct by a pressure gauge. The conventional way is to open the well if closed before, or close it if open, for five minutes, and take the reading at the end of five minutes. It is evident that this is a severe test when applied, as it will be later on, to a calculation of the amount of gas which has flowed from the field between certain periods of time. The rock pressure is about 600 pounds per square inch (a trifle less as a rule), or about 40 atmospheres. As a cubic foot of gas means a cubic foot at normal atmospheric pressure, and the volume occupied by gas varies inversely as the pressure—i.e., double the pressure expressed in atmospheres and the volume is decreased one-half—it is plain that when the pressure on the gas is reduced, as it always is before using, to about the normal atmospheric rate, the gas will occupy forty times the space it did in the rock. So that the insignificant pore spaces in the rock, very often so small that they cannot be seen by the naked eye, are capable of storing a large amount of gas.

The amount of pore space in the rock is the only factor in the calculation which cannot be measured directly or approximated in any way. From observations in other fields, however, it is calculated that the pore space runs generally from 4 to 16 per cent. of the total volume of the rock. Taking 10 per cent. as the mean,

with the area, thickness and rock pressure mentioned above, we arrive at about 38,000 million cubic feet as the total probable output of the field.

This calculation admittedly depends on one thing which cannot be measured directly, but an independent check can be applied by an observation of the difference in rock pressure at two periods of time sufficiently far apart, and noting at the same time the amount of gas which has been produced. Thus from January 1908, to May, 1909, inclusive, the total amount of gas produced from this field, including the waste, was about 1,810 million feet; this is 4.8 per cent. of the total supply calculated above, whereas the actual drop in the rock pressure, which is a definite accurate measure of the loss of volume, is only about 3.0 per cent. It is not possible with any other mineral product to make a calculation of this nature. We must, then, conclude that either the area or the pore space or the thickness has been assumed as too small. Applying this correction gives about 61,000 million feet as the probable output. This, as emphasized before, cannot be too large and probably is too small, as any extension of the gas-bearing rock under the lake could not show its effect on the pressure till a considerable reduction of the gas supply, and consequently in the pressure, takes place. The amount given, about 61,000 million feet, is the minimum possible supply. The length of gas-bearing rock measured along the lake shore is 8 miles, an extension of that two miles more out into the lake—and there is no reason why it should not go ten miles—would increase the area by about 16 square miles, or about 50 per cent., and would probably increase the gas supply by the same amount. For the probable amount 70,000 million feet would doubtless be nearer an intelligent estimate than 61,000 million.

How Long Will the Supply Last?

The interesting question of how long this supply of gas will last is more difficult to determine, as it depends on the uncertain action of individuals animated by a variety of purposes, and not on any of the laws of nature. It will depend mainly on how well the gas is conserved; this in its turn is governed by legislation, and the manner in which the law is enforced. The greatest danger threatening the natural gas supply is the action of those drilling for oil. As mentioned in explanation of the operations of the Supplementary Revenue Act in 1909 elsewhere in this report, the gas area and the oil territory in the County of Kent are closely connected. The oil if obtained can be sold at once, whereas to sell the gas, long expensive pipe lines must be laid, franchise obtained from towns and cities, and then so much gas only can be sold each year. Moreover, the great expense of pipe line, increasing as the distance to which it is to be transported increases, prohibits taking the gas far to market. The individual interested in oil will, unless restrained, undoubtedly in the future as in the past sacrifice gas recklessly to secure a trifling amount of oil.

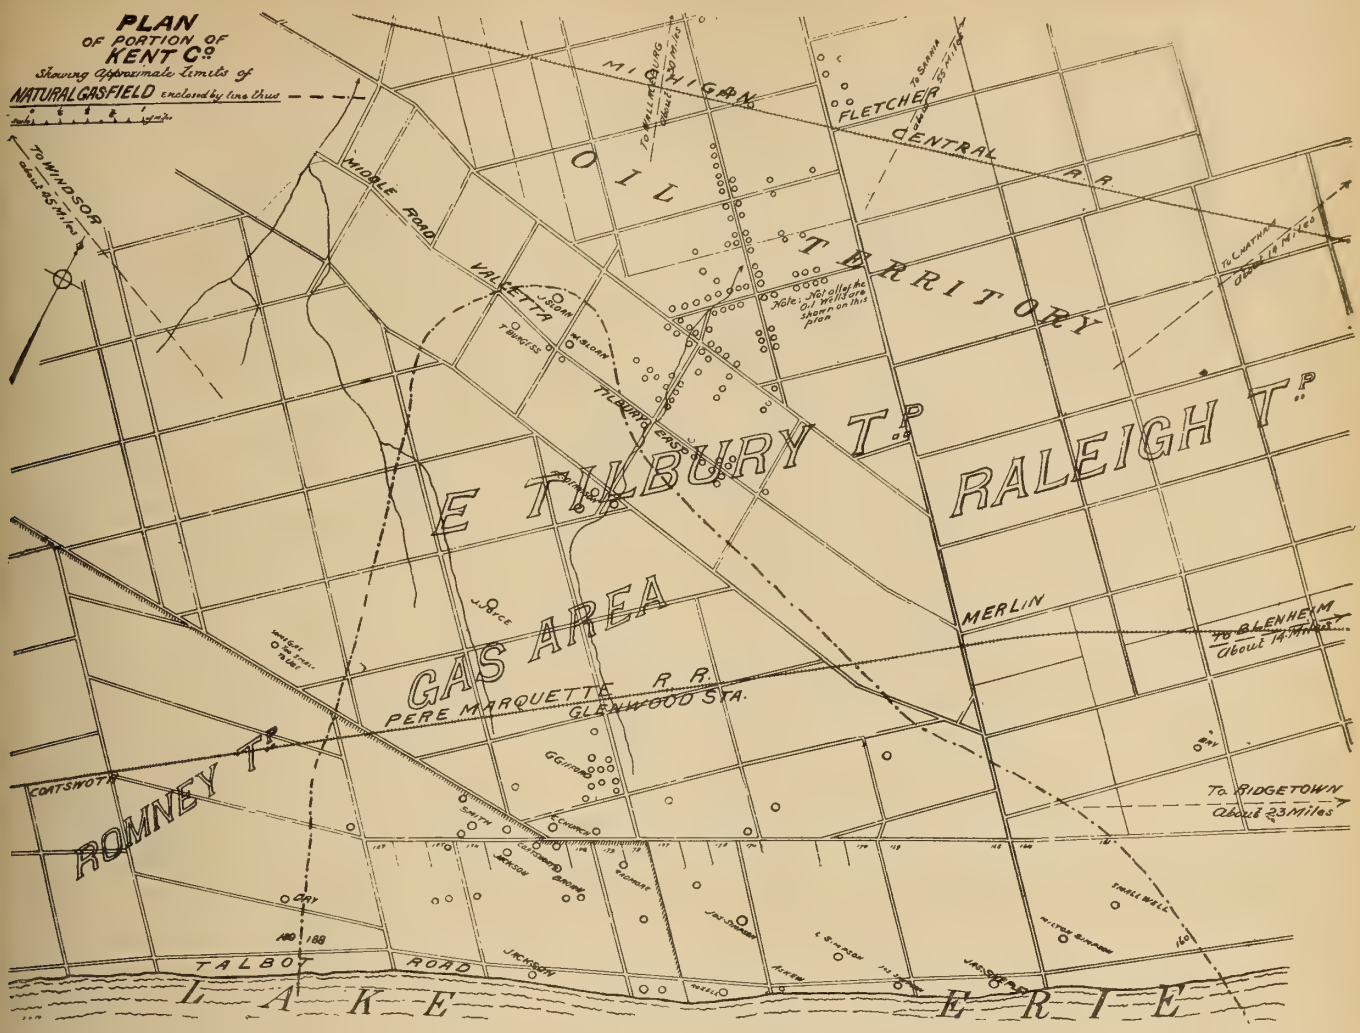
The use of natural gas for certain industrial purposes, e.g., as a substitute for coal under ordinary boilers to make steam, will tend, of course, to shorten the life of the field. Assuming that it was used only for domestic purposes, i.e., cooking, heating and lighting, the supply ought to last the 50,000 people who are now connected with the field thirty-three years at least, with a strong probability that it will exceed that period of time considerably.

The above calculation allows one million cubic feet per day throughout the year for each 10,000 of population. This is a liberal allowance. The city of Toronto, using artificial gas in many houses for cooking and heating and also for lighting, and to some extent for industrial purposes, with a population of 350,000, say, consumes about seven million feet per day all the year round, or 200,000 feet per day for each 10,000 inhabitants. This artificial gas is not equal to natural gas in heating efficiency, which varies according to the mode of manufacture; the kind supplied in Toronto is equivalent to only about two-thirds the same amount of natural gas. Thus, the efficiency of Toronto gas is 651.8 British thermal units per cubic foot (Dr. Ells' report on System of Lighting for Toronto, 1900), whereas the natural gas has an efficiency of about 1,000 B.T.U. (Poole, Calorific Power of Fuels). The town of Galt, with about 10,000 people and approximately 1,800 meters in use, the gas being consumed for cooking, lighting, and to some extent for heating, consumes about 280,000 feet per day (statement from Dominion Natural Gas Company). The best example is probably Chatham, which takes its supply of gas from this field. The average consumption per day for domestic purposes, as shown by the 2,000 meters installed, is 700,000 cubic feet (Volcanic Oil and Gas Company). The population is about 10,000 and gas is used freely. On this purely domestic basis of consumption, 30 per cent., or ten years, more should be added to the life of the field.

In 1894 a select committee of the Legislature was appointed to enquire into the production of natural gas in Ontario. After investigating the matter thoroughly this committee stated in its report:

"That as regards the economic uses of natural gas, witnesses are agreed that it is one of the most valuable of all fuels, and in view of the limited supply it appears desirable that its use as far as possible should be confined to the purposes of domestic fuel and in the production of the finer classes of manufacture."—(Journal Legislative Assembly, Vol. XXVII., 1894, Appendix No. 1, p. 6.)

Nothing has happened since to modify the conclusion arrived at then; in fact, the continued depletion of all fuel supplies emphasizes the soundness of this judgment. In calculating the life of the field, therefore, it seemed desirable to give it under the best possible conditions. The actual life will depend on how nearly these conditions are fulfilled.



Relative Value of Oil and Gas.

As the units used in speaking of gas and oil are quite different, it seems desirable to reduce both to some common basis so that a comparison may be made between the two. Natural gas is employed mainly as a source of heat, the amount used directly for light being relatively insignificant. Oil, on the other hand, is chiefly known as an illuminant. Gas and oil will be compared both as heat producers and illuminants. The most rational method is to find the heating efficiency of each. When the two products are used for lighting under the most economical conditions, that is with a mantle, the light given is proportional to the heating power. What occurs is that the mantle is heated to a high temperature and radiates the light; where the naked flame is used the particles of carbon become heated and act as radiators.

Poole, "Calorific Power of Fuels," p. 251, gives the following data concerning various oils:—

	British thermal units per gallon.
Bothwell oil	173,400
Ohio, refined	164,736
Ohio, crude	172,800
Canadian Oil, refined (Dr. Ells' report quoted above)	154,585

Natural gas averages about 1,000 B. T. U. per cubic foot; thus Poole, p. 254, gives 1,050 as the mean for Ohio

gas, which is most closely allied with the gas in Kent. No determinations of the Kent gas for heating efficiency have been made, as far as the writer is aware. With 1,000 cubic feet as the unit for gas, this would give, of course, 1,050,000 B. T. U., and assuming the average efficiency of the oils given it will be seen that about 6.5 gallons of oil are equivalent to 1,000 cubic feet of natural gas. A barrel of oil (35 gallons) is therefore equal to about cubic feet of natural gas in heating power and, consequently, in illumination.

Coming to the question of the quantity of oil that will be produced, no such calculation of the amount in a given field can be made as was done with gas. The rock pressure as an indicator fails here. The oil being a fluid cannot find its way as readily through the rock. All we have to rely on is the actual result in production from wells drilled; where these are sufficient in number (several hundred in this case) and show the same general results, the evidence is strong enough to form a conclusion. As far as the strata already tested are concerned (i.e., to about 1,430 feet in depth) the information seems sufficient. Thus the production from the oil territory in question in East Tilbury, Romney and Raleigh is given in the Eighteenth Report of the Bureau of Mines, p. 33, as follows:

	Barrels.
1906 (first production in this year) ..	106,992
1907	411,588
1908	201,283
1909 (see present volume)	124,003
Total	843,866

It will be noticed that there has been a very rapid falling off in the oil production—about 50 per cent. in each year. For 1910 the amount will probably not exceed 50,000 to 60,000 barrels. The yield of well after well has declined in a way that must be painfully monotonous to the operators. The total production of oil, therefore, up to the end of 1909 is equivalent, on the basis explained above, to 4,556 million cubic feet of gas. As the minimum gas supply in the Kent field was calculated to be 61,000 million feet, the oil production to the end of 1909 is equivalent to only about one-thirteenth the estimated gas production. The probable yield of 50,000 barrels of oil for 1910, or 1,750,000 gallons, is equal to 270 million feet of gas, or less than the average production of gas for one week from that field during 1910. There may, of course, be oil in lower strata, but that is only a possibility.

Looking at the matter in another way, 6.5 gallons of oil are equal to 1,000 cubic feet of gas in efficiency, or 6,500 gallons of oil equal one million feet of gas. At the rate of five million feet per day, assumed above in calculating the life of the gas field, this is equivalent to 32,500 gallons of oil per day, or somewhat less than 1,000 barrels per day, more exactly 339,000 barrels per year, and, as was shown above, this can continue for thirty-three years at least.

Comparing the cost to the consumer of illumination derived from oil and gas respectively, it will be seen that he would have to buy refined oil for the same price as is paid the producer for crude oil delivered at the railroad, in order to have an equal amount of light for the same cost as from gas bought at the current rates in that locali-

ty. Thus $1.24 per barrel or 3.5 cents per gallon is paid for crude oil; multiplying this by 6.5 the number of gallons equal to 1,000 feet of gas, gives about 23 cents as against 25 cents per 1,000 feet ordinarily paid for natural gas from that field. Crude oil is of course not all burning oil. In this locality it consists of about 40 per cent. kerosene or illuminating oil, the balance being lighter products such as benzine, etc., and the lubricating oils.

The relation between illuminating power and oil consumption in everyday practice is very difficult to arrive at exactly by direct test. The art of using the oil to the very best advantage is not ordinarily as far advanced as it is in the case of gas. The illumination depends on the quantity of oil burned in a given time. Other circumstances have influence, however, as Argand burners, for instance, give more light from an equal amount of oil than flat wick burners. "The character of the wick, the dimensions of the chimney and the size and shape of the oil reservoirs are factors of only slightly less importance than the form of the burner." (Boverton Redwood, Petroleum and Its Products, Vol. II., p. 674.) Redwood states that the average consumption of oil per candle light per hour, using duplex Argand burners, is 50 grains, equivalent to 1,120 candle-hours per gallon of oil. With ordinary burners the oil consumption would be much greater. Artificial gas burnt without a mantle gives about 2,800 candle-hours per 1,000 cubic feet. No one would nowadays think of burning natural gas without a mantle. With the use of this about 2 1-2 cubic feet per hour of natural gas give 25-candle lights or 1 cubic foot gives 10 candle-hours, and 1,000 cubic feet give 10,000. Therefore 1,000 cubic feet of natural gas are equivalent to slightly less than 9 gallons of oil in illuminating power under ordinary circumstances. Of course, as the conditions under which oil is burnt are perfected, the relations will approach those explained before, where 1,000 cubic feet of gas were found to be equal to 6.5 gallons of oil.

Mine Ventilation on the Rand.

(Written for the Canadian Mining Journal.)

The subject of mine ventilation is just now receiving considerable attention on the Rand and at last there seems some hope that the scourge of miner's phthisis so long prevalent on these fields is in a fair way of being reduced to a minimum.

It is unnecessary to give figures showing to what extent this disease is rampant amongst miners on the Rand, they have been so frequently quoted that repetition is unnecessary, save to say that it exists to a much larger extent amongst the gold miners on the Rand than in any other mining district of the world. So evident was this that three years ago the Transvaal Government appointed a commission to enquire into the Mining Regulations and report in what way they required amendment in order to combat this and other evils, and their report has just been issued. As far as ventilation is concerned the Commission recommend the adoption of a quality standard in place of a quantity standard for the mines, apparently on the ground that they consider that the quantity of air laid down by the present Mining Regulations the same as in Australia and New Zealand, viz.: 70 cubic feet of air per minute per person underground is one that the mines ought not to be expected to carry out, a conclusion quite unwarranted by the prevailing underground conditions on these fields.

It has always puzzled engineers with experience of mining in other British colonies to understand why in the respect of ventilation the Mining Regulations in the Transvaal have always been a dead letter, no attempt having hitherto been made to carry them out although hundreds of lives have been lost indirectly through suffocation below ground, and indirectly many hundreds more through miner's phthisis brought on by the lack of ventilation below ground in direct contravention of the Transvaal Mining Regulations.

At a crowded meeting of the Chemical, Metallurgical and Mining Society of South Africa, held on Saturday, Mr. S. Penlerick read a paper on "Ventilation and Health Conditions on the Mines of the Witwatersrand." Mr. Penlerick is one of the general managers of the East Rand Proprietary Mines, where a system of fan ventilation has just been introduced. It was pointed out by Mr. Penlerick in his paper that dust, tuberculosis and dynamite fumes were the principal causes of disease amongst the miners on the Rand.

Dust and fumes from explosives, said the writer of the paper, the former caused by rock drilling, blasting and handling the rock could only be rendered harmless by an abundant supply of fresh and clean water and ventilation efficiently applied and distributed throughout the working places. As for water, the "James Water Blast" or some similar device was quite satisfactory, but on the East Rand Proprietary Mines they simply connect the 3-4-inch water pipe to the 2-inch air pipe, fitting cocks on each behind the junction, at a convenient point for operation, taking care that no water got into the air pipe except when the water blast was required, whilst an ordinary hose pipe was all that was necessary for spraying rock in the process of being filled and handled underground. He considered that neglect to use these appliances on the part of the miners should be made a criminal offence, and punishment meted out accordingly.

Ventilation would remove all the very fine dust, and he was distinctly of the opinion that wet and dry bulb temperature observations should be taken at least once a month in all development drives and working stopes and systematically recorded in a book kept for that purpose. He quite agreed with the recommendations of the Mining Regulations Commission that the proportion of carbon dioxide should not exceed twenty volumes per ten thousand of air, or one volume of carbon monoxide to ten thousand of air, whilst no determinable amount of the oxides of nitrogen should be allowed to be present.

Mr. Penlerick then went on to describe the ventilating fans brought into use at the East Rand Proprietary Mines, which are as under.

Angelo mine; Sirocco double inlet; diameter, 10 feet 6 inches; width, 8 feet 6 inches; output, 300,000 cubic feet per minute; W.S., 3 inches.

Cason mine; Barclay's double inlet drum pattern, diameter, 16 feet; width, 8 feet; output, 350,000 cubic feet per minute; W.S., 4 inches.

The Sirocco fan produced a total return air current of air at the shaft of 317,000 cubic feet of air per minute with a 3.25-inch water gauge—whilst the Barclay fan produced 179,000 cubic feet of air at the Cason upcast shaft with a 1.3. inches of water gauge. The difference in intake amounts of air recorded at the different shafts were: Cason, 101,400 cubic feet; New Comet, 90,000; Angelo, 140,000, and the Farrar shaft at the

Driefontein section, 140,000 cubic feet of air per minute.

The results of the application of fan ventilation to the East Rand Proprietary Mines were to reduce the average condition of the atmosphere of the mines from .493 per cent. of CO_2 to .127 per cent. of CO_2 and CO from .012 to .005 whilst the average temperature of the atmosphere of the mines was reduced by 2 degrees to 3 degrees F.

The total expenditure of capital in erection of the two fans, including cost of fans, motors, equipment of upcast shafts bratticing, doors, pipes, etc., was no less a sum than £25,000, whilst the running cost, including maintenance, came out less than a penny per ton milled.

It is clear from the above that if the recommendations of the Mining Regulation Commission regarding ventilation are to be carried out, every mine on the Rand will have to be ventilated by fan, or other artificial means, and not be left to depend on natural ventilation aided by the exhaust air from the drilling machines.

The paper gave rise to a long discussion. Dr. Irvine who has long been an advocate of better mine ventilation on the Rand, urged that the paper showed that it was possible to have good ventilation, and laid once and for all the bogey of bad underground conditions now prevailing in the Rand mines. He would not take away the blasting certificates from miners found to be suffering from tuberculosis, as recommended by the Commission, but would refuse to give certificates to fresh applicants unless they produced medical certificates proving that they were free from that disease.

Mr. Penlerick in reply to a question said that the East Rand Proprietary Mines had been repaid many times over for the capital outlay involved in the ventilation scheme.

Mr. Gascoigne complimented the author on the up-to-date methods of ventilation, and pointed out that the other mines would do well to work as much as possible on the same lines. Fresh air underground was as essential as water for dust laying operations. Compliance with the law should be insisted upon and he ridiculed the idea, as stated by the Commission, that 70 cubic feet of air per minute per person could not be provided. He pointed out that proper distribution was necessary, and congratulated Mr. Penlerick upon taking his intake air to the lowest point and providing shafts solely for upcast purposes, an essential condition other mines on the Rand seemed disposed to ignore.

Mr. Judge thought detonation produced more dust underground than the machines.

Dr. Macauley pleaded for the adoption of mechanical ventilation from one end of the Rand to the other on the lines introduced at the East Rand Proprietary Mines.

Dr. Porter, a member of the Mining Regulation Commission, defended the report of the Commission against the attacks made against it and the Government against the complaints that the report had been delayed in view of the elections. He agreed with Mr. Judge as to the origin of dust underground, but pointed out that in Johannesburg the deaths from pneumonia compared favourably with those resulting from the same cause in England and Wales.

Further discussion was adjourned.

Rowland Gascoyne,
New Club, Johannesburg.

PRACTICAL AND ECONOMICAL MINING

By Neil A. Nicholson, Deputy Inspector of Mines, Sydney Mines, N.S.

(Paper read before the Mining Society of Nova Scotia.)

A new era in the history of coal mining is rapidly developing in Nova Scotia, and the hand-pick, wherever conditions are favourable, is being supplanted by machines for under-cutting coal. Where coal-cutting machines cannot be used, improved methods of mining have been adopted which tend to greater economy and better results.

The larger coal companies, such as the Dominion, and the Nova Scotia Steel & Coal Companies, having coal-fields lying at easy angles and therefore favourable to machine mining, have equipped their collieries with the most modern and improved coal-cutting machines, and in common with many of the smaller coal companies, have adopted the latest methods of handling, cleaning and assorting coal on the surface in preparation for the market.

The principal reasons for the installation of mining machinery are, to reduce the cost of production, to increase the output, and to obtain the largest percentage of lump coal.

The introduction of machinery into the coal mine has not reduced the number of men employed, but as in other trades, the stimulus of labour-saving devices has greatly helped the industry, and a scarcity of miners rather than a surplus now exists.

If we make a comparison of, say, one machine colliery with a hand-pick, or a number of hand-pick collieries, the advantages of coal-cutting machines will be fully demonstrated. Dominion No. 1 colliery, Cape Breton, during the year 1909, employed underground 463 men. The output for the year was 544,499 tons. The hand-pick collieries of Cumberland combined, only produced 508,202 tons in the year 1908, yet they employed underground 1,806 men.

While mining machines are of great value in coal getting, they are a most important factor in the rapid development of the collieries.

The introduction and extended use of coal-cutting machines in thin "seams," or beds have made the working of these profitable and placed many of them on a competitive basis with the thicker seams. The British Royal Commission on Coal Supplies in their report stated that in the year 1900 about 17.7 per cent. of the total output of the United Kingdom of Great Britain was obtained from the seams of less than three feet thickness. If seams less than three feet can be worked successfully in any other country, there is no reason why they should not be worked in Nova Scotia, conditions being equal.

Coal mining being the chief industry of Nova Scotia, the province's greatest asset is her mines and minerals. These should therefore be protected, as they are the heritage of the people. Along the eastern seaboard of the County of Cape Breton there are valuable coal-fields. Some of these fields contain five or six workable seams overlying each other with a variable thickness of strata

intervening. The question arises, which of these seams should be first attacked? In my opinion, if the market affords it and other conditions permit, the descending order of working is the most practical. Working the top seam first is beneficial to the seams below, forming a cushion over them, especially over the thick seams. By thus relieving the pressure above, the proportion of slack in the underlying seams is reduced. The liability of a crush is averted, and the risk of men's lives is lessened by the lessening of the vertical pressure of the strata. Fatal accidents have often resulted in times of "creeps" or "crushes" in coal mines when sudden pressure has been exerted, and large lumps of coal suddenly forced out upon the miner without any warning whatever.

By working the lower seams first, all the strata right up to the surface is disturbed and broken; and while this settling process is taking place, the upper seams are damaged and sometimes wholly destroyed.

The possibility therefore of danger to other seams must be carefully considered in opening up a coal-field containing seams overlying each other, and the method least calculated to seriously affect the commercial value of the coal-field should be adopted. The tendency of past years seems to have been to work the most profitable seams first, but it has had very baneful effects, and has not always been the most profitable system of mining. Of course I am well aware that competition plays a large part in determining what seams must be opened up first. But if keen competition forces the opening up of the thicker seams at the beginning, might it not be well to consider the workings of thin seams at the same time? This would be a decided improvement on the methods of mining coal, and wherever tried in the province has met with good results.

The method of mining is generally determined after a careful study of the thickness of the seams, the nature of the strata above and below, the angle of the seam and the texture of the coal.

The method of mining coal in Nova Scotia is generally either bord-and-pillar, or long-wall.

The conditions favourable to long-wall working are thin seams which freely part from the roof, and tender strata over head. A band of "dirt" which is easily separated from the coal, makes material for stowage with which to fill up the goaf when the coal has been extracted, so that the roadways, which sometimes must be naturally very long, can be supported. Particular pains, are, however, taken to support the roadways and packs, or packwalls are built on each side of the roadway from the floor to the roof. These are usually of stone blasted from the roof or the pavement. In the long-wall method, ventilation is simple, as the full current sweeps along the working-face without the aid of brattice, and free from obstructions met with in the bord-and-pillar system. In very deep workings the vertical pressure is such that long-wall is the only system that can be adopted.

When conditions are not favourable to long-wall the most practical system is the panel system . When passages are being driven to win the coal, these should be continued back to the boundaries. At the same time headways or balances should also be driven from the main levels to the rise, a distance of four or five hundred feet, and rooms turned off to suit the cleavage of the coal. As soon as the rooms have been driven through to the adjoining balances, pillars should be drawn at once and all the coal extracted. This would save the expense of ribbing, would relieve the pressure and prevent a "crush" or "creep" in that district, and, as usual, where work is concentrated, the cost would be reduced to a minimum and larger profits obtained.

The size of pillars varies in different collieries and is determined by the nature of the coal, the thickness of the seam and of the cover over it. Small pillars have often induced "crush" and "creep" and brought great loss to the owners; but this lesson has been so well learned in Nova Scotia that the present tendency is now all the other way. Especially must large pillars be left where the roof and floor are very strong and the nature of the coal is soft and tender. Where these conditions are the opposite, a smaller pillar may be left; but at no time should any risk be taken, and the margin of strength in the pillar be less than that stated by leading mining authorities.

As passage-ways are driven to win the coal, and districts opened up, all coal should be extracted, except where it is necessary to leave pillars for the support of surface plants, residences, main roads and railways. Under-sea working (and we have at the present very much of it in the Island of Cape Breton) requires special attention and has to be dealt with according to the nature and thickness of the cover. The fact that much of the coal that is now being extracted is taken from collieries opened up fifty years ago, is proof that present methods are superior to those of our predecessors, and it is only natural that they should be.

Discussion.

President Brown.—I would like to have the great pleasure of proposing a vote of thinks to Mr. Nicholson for his paper. This paper touches on a subject that is of the utmost importance, successful coal mining in the Province of Nova Scotia. He has put on the records of the society the first paper treating on this subject.

R. H. Brown seconded the motion.

J. A. Johnson.—In Mr. Nicholson's paper there is one striking point to me, namely that about 400 men have produced 500,000 tons of coal in Cape Breton, while in Cumberland with 1,000 men they did not produce so much.

President Brown.—The conditions under which coal is mined in Cumberland and in Pictou counties are so much more unfavourable, that the production of the counties is not to be criticized.

T. Cantley.—The idea might be got from the remarks of Mr. Johnson that because in the case of Cape Breton five hundred thousand tons are produced by four hundred men, that a thousand men in Cumberland should produce more. I wish it were so, but unfortunately it is not. In order to install mining machinery to do such work as is done in Cape Breton you must invest a very large amount of money in machines, piping, etc., and all the expenditure for wear and tear, which is a matter which runs into very large figures; so that the difference in cost of production in the two districts is not so great as would at first appear. The large amount of capital which is employed in a machine-wrought colliery against the lesser capital employed in a hand-picked mine, must be considered. Dominion No. 1 colliery, Cape Breton, employed 463 men, and the output for the year is 544,500. The hand-picked collieries of Cumberland employed 806 men and the output was 582,202 tons in the year.

A vote of thanks was presented to Mr. Nicholson.

At the Mammoth smelter, Shasta County, California, 1,000 woollen bags are used to filter the smelter fumes. The bag house is divided into five sections, each of which can be shut down to empty the bags. The bags are emptied and shaken mechanically. The dust is removed in cars, dumped into a receiver, mixed with water, briquetted, and charged back to the furnace.

OUR EUROPEAN LETTER.

The Rand no Longer a Land of Sensation—The Speculator's Loss and Investor's Gain—The View of the Present Situation—Pessimistic Views of Maikop—Japanese Mining Exhibits in London—Unhealthy Tin Movements—The Romance of Northern Nigeria—Cinderella of Mining Region Coming into Her Own.

(Exclusive correspondence of "Canadian Mining Journal.")

London, Sept. 21st, 1910.

No special activity is as yet being shown in mining share dealings in London or Paris and no startling news has come from South Africa to liven things up. This makes "Kaffirs" less interesting to the speculator but interests investors more. If Rand mining companies had depleted their gold reserves in August as was done in December, 1908, their return for last month would quite easily have established a new high record. The actual gold production has now reached an average of $440,820 per day, as compared with $437,590 in July, and judging by the preparations for starting new heavy stamps at a number of properties the day cannot be far distant when the average output will attain $500,000. There were again a few properties whose result in August fell short of the reasonable anticipations of their owners. This was in a measure due to the replacement of about 20,000 time-expired native miners by about 18,000 raw workers, whose inexperience had naturally an immediate effect on the output.

With every year that passes, the Transvaal gold mining industry becomes more stable.

One of the contributory reasons for the settling down of the Rand gold-mining companies into a regular and comparatively humdrum, prosaic existence is the ease with which the labour requirements of the industry have been met during the past two years. Recently there have been fluctuations calling for some comment, but the old-time alarm which used to periodically upset the equanimity of proprietors and help the operations of the speculator when a shortage of "boys" took place has been practically non-existent.

On the question of mechanical improvements the Rand is very much alert. Much has been accomplished in the way of reforms, both before and since the departure of the Chinese in organizations, in the economy of labour, and in the adoption of new mechanical appliances, but more remains to be done. That well-worn subject of controversy—the tube-mill—is still under occasional discussion, and the results obtained from it have helped to concentrate more attention than ever on the problem of crushing. It is considered that the Mines Trials Committee have done good work in bringing the efficiency of the tube-mill up to "25 per cent. of that of stamps," but it is thought by some of the most practical mining engineers on the Rand that the qualities of the tube-mill are not fully understood, and that when it is fed with ore of the size best suited for such treatment a still higher efficiency will be obtained. The ore-crushing problem is still receiving keen attention, and it is tolerably evident that either the present form of stamps is quite likely to be very much improved or this plan of treating the ore abandoned in favour of something altogether more efficient.

In mining fields where the surface of the country is either mountainous or very much broken some system of telpherage or overhead transport, is usually found the most economical for mining purposes. But on the Rand this system has never found much favour, and, although efforts are still being made to introduce new methods of telpherage the nature of the surface hardly justifies the initial outlay and cost of upkeep.

If it be true, as appears to be the case, that the majority of the Liquor Commission is in favour of resuming the supply of alcohol for the natives on the Rand, then the decision is a matter of very serious import to the whole mining industry. The majority of the report and the recommendations of the Commission indicate that an attempt will be made to at least introduce native wine. In this connection it has to be observed that the Cape wine farmers control sixteen seats, and this circumstance places the report of the Commission in a very sinister light. The Commission appears to ignore the well-known fact that when a Kaffir gets drunk he becomes a homicidal maniac of a most pronounced type, and that the habitual drunkenness of the "boys" in the pre-war days was one of the most serious handicaps to the mining industry.

The "Great Maikop Oil-field" has retired somewhat under a cloud. The experts, who day after day were ladling out views and opinions, have retired from the arena, and bad reports are drifting in from Russia. The only ground properly existing for the optimistic reports turns out to be the outbreak of the great gusher in September last year. This it will be remembered was plugged and it is impossible in the present state of affairs to estimate its future—even its near future. Other alleged gushers, it is stated in responsible Russian journals, do not exist in any form. The leading Russian paper says that, apart from the great gusher named, not one of the other wells sunk or being sunk is worthy of mention. The only reason that may be said to exist for a hopeful view otherwise apart from the said gusher, is that certain geologists maintain that the geological formation favours an accumulation of petroleum.

The Japanese British Exhibition, which is a popular feature of the London season this year, shows many exhibits, specimens and large diagrams relating to the mineral resources and industries of the Island Kingdom. It appears that the oldest established mining company in Japan on a large scale is the Mitsu Bishu Company, with a capital of $7,500,000. This combines mining with banking, shipping and manufacturing. Its six coal mines and ten metal mines (gold, silver and copper, produce annually 1,300,000 tons of coal, 6,500 tons of copper, sixteen tons of silver, and 1,680 pounds of gold.

The Mitsui Company comes next in importance. This is also a banking company, its total capital being $20,000,000. It owns one metal and four coal mines. Its annual coal output is now two and a half million tons. In its biggest colliery, which has large quantities of water to contend against, it uses over 1,600,000 horsepower in 76 pumps which pump about 18,000,000 tons of water per year. The pumps are Davey Company, differential, Sulzer turbine, and Schleifmuhle. It employs 6,000 hands, looks after its working people very well, even to the establishing of creches, as many women work at loading.

The Fugita Company has a capital of $3,000,000, and includes gold mining, forestry and agriculture. At Kosaka this company has complex sulphide copper ore to deal with. By persistent scientific researches upon commercially economic methods of dealing with the by-products, it has made it a profitable venture. This

company employs 9,300 workers. The bulk of its operations is in open or surface work. The ores are first smelted in blast furnaces, then crushed, and afterwards calcined and further reduced in Herreschoff calciners and reverberatory furnaces.

The oldest and richest gold mine in Japan is on the Sado Island, producing 13,800 ounces of gold and 113,000 ounces of silver per annum. The oldest copper mine is that of Beshi, worked over 200 years by the Sumitomo family. It has lately been developed on modern lines and turns out copper annually worth nearly $2,000,000. There are other great colliery enterprises, initially encouraged by the Mikado's Government. The Hokkaida Company produces annually coal worth $3,500,000. One unusual feature of Japanese mines resulting from the volcanic character of the country is that many of them are on small islands. The mine occupies the whole area of the island and in some cases stretches under the sea. The oil production of Japan is of considerable importance, one company alone having an annual output valued at one and a quarter million dollars.

In view of the recent revival here of speculation in tin shares, which was obviously chiefly accelerated by the startling rise in the price of the metal, it may be well, perhaps, to remember that present market conditions are altogether abnormal and are in no way due to any improvement in the statistical position. The returns issued for August, indeed, disclosed an increase of about 1,100 tons in the London stocks, while the visible supply was swelled to about 18,300 tons, which is only some 1,500 tons less than a year ago, when the price was $120 per ton lower. Hardly ever in the history of the industry has there been a lift of prices of $80 per ton such as recorded in the last few weeks in the face of similar adverse statistical developments, and manipulation on a scale heretofore unknown has been mainly responsible. The London stock, amounting to some 5,700 tons was but 800 tons under that of last year, but the fact remained that very little of that large stock was actually available for market needs.

Since the richness of the alluvial tin fields of Northern Nigeria, West Africa, has become an established fact, whenever two or three old West Africans meet together you hear nothing except about lost opportunities in Northern Nigeria, and it is really a fact that in an unscientific manner reports about the richness of these fields have been circulating on the coast for years. But the traders and the civil service men had too comfortable berths to risk their skins in prospecting and pegging out work. More kudos then, to the plucky Mr. Laws, the mining adviser to the Niger Company, for hanging on through no report and bad report to his prospecting work Bauchi way, notwithstanding the cold water which his own officials at home threw upon his initial efforts. It is notorious that the directors of the Niger Company did not want to be bothered with mining.

Still, the mineral resources of Northern Nigeria were not appreciated in London adequately to their prospects. It generally requires a forlorn hope to do justice to a new mineral country. Is it not a fact that "Beam-enders" have been generally the class of men who have done justice to nearly all the great mineral fields of the world? Beam-enders discovered the Great Boulder, and I could give any amount of instances of desperate mineral enterprises which have led on to fortune.

Lord Scarbrough, year after year, told the British public, through his annual speech to the shareholders of the Niger Company, that there was treasure in Northern Nigeria in the shape of alluvial tin. He had to wait until a company—the Champion Gold Reefs of West Africa, Limited—having abandoned its gold property on the Gold Coast, and really desperate how to utilize its remaining capital—about $60,000, I believe,—came along, and sent some prospectors, followed out by engineers, to Northern Nigeria, who secured the pick of the country. On the 4th of February this year, the Champion Gold Reefs of West Africa, Limited, acquired from the Niger Company, the Naraguta for a large sum of money, and Lord Scarbrough was no longer a mining John the Baptist crying in the wilderness, nor need the shareholders of the Champion Gold Reefs of West Africa feed any longer on locusts and wild honey, for on the strength of the profits of their Northern Nigeria enterprise, they declared in March last, an interim dividend at the rate of 100 per cent. and since its acquisition of the Naraguta property during the last six months an estimated net profit of $50,000 has been made upon the sale of tin from that one property.

Since the Champion Gold Reefs of West Africa turned disciple and listened to the teaching of Lord Scarbrough, the Northern Nigeria Mining School of Adventurers have added to their number representatives of Messrs. Wernher Beit, the Consolidated Gold Fields of South Africa, groups of bankers and others.

In all seriousness, to use the words from an address before the Royal Colonial Institute on Recent Developments in West Africa: "If the professional reports upon these tinfields in Northern Nigeria are anything like approximately correct, and the supply is regulated, a fabulous amount of wealth is waiting to be extracted."

A NEW MINES BRANCH EXPERIMENTAL PLANT.

The Mines Branch of the Department of Mines is installing an experimental testing plant in Ottawa for the concentration of magnetic ores.

When completed, the plant will consist of a standard Gröndal concentrating unit, comprising an ore crusher, ball mill, and two Gröndal magnetic separators operating in tandem; the capacity of the plant being from two to four tons of crude ore per hour.

The plant is being installed for the purpose of testing low grade magnetic iron ores and sands, with the view of proving their amenability to concentration by the Gröndal wet system.

Tests will be carried through for the determination of the following points:—

(1) Extent of crushing required to raise the iron content of the crude to 65-70 per cent. in the concentrate.

(2) Extent of crushing required to depress sulphur, phosphorus, or titanium content to percentages acceptable to furnace men.

(3) Number of tons of crude that are required to produce one ton of concentrate.

(4) Power consumed per ton of crude ore concentrated.

(5) Cubic feet of water used per ton of crude ore concentrated.

It is expected that the plant will be ready for operation about the first week in November, 1910. Tests will be made free of charge on Canadian ores, but it is required that shipments shall be delivered carriage paid at the testing plant at Ottawa.

Shipments of ore for testing purposes should not be less than five, nor more than twenty tons; and it is particularly requested that shipments be made in bags containing not more than 100 pounds of ore, to facilitate handling.

THE CONSOLIDATED MINING AND SMELTING COMPANY OF CANADA, LIMITED

Directors' Report

To the shareholders of the Consolidated Mining and Smelting Company of Canada, Limited:

Gentlemen,—Your directors beg to submit the fifth annual report of the company's operations, together with the managing-director's report, the financial statement and auditors' report for the year ending June 30th, 1910.

The tonnage of ore handled at the smelter was 487,125 tons, against 347,417 tons in 1909.

The profit for the year was $309,945.08 and added to the balance at the credit of profit and loss account as shown last year makes a total of $671,011.09 at credit of that account.

During the year two properties have been purchased. The La Plata, or Molly Gibson group, near Nelson, B.C., for payment of which 2,000 shares of the capital stock was issued, also the No. 7 group in the Boundary district. The operating of these mines, your directors believe, will prove profitable to the company.

The property and plant accounts, after paying for the above properties and additions referred to in the managing-directors' report, and after writing off for depreciation $175,502.60 from the profits of the year, show an increase of $244,202.19.

W. D. Matthews,
President.

Toronto, 27th September, 1910.

Financial Statement

The Consolidated Mining and Smelting Company of Canada, Limited, for year ending June 30th, 1910

Liabilities

Capital:		
Authorized	$7,500,000.00	
Issued 55,552 shares of $100 each		$5,555,200.00
Sundry banks:		
Bank of Montreal:		
Loan and overdraft	763,528.55	
Accrued interest	680.95	
	$764,209.50	
Pay roll bank accounts overdrawn	1,803.10	
		766,012.60
Contingent liability at June 30th, 1910, on drafts against matte shipments	131,845.95	
Accounts payable and unpaid dividends		51,673.44
Reserve: Including provision for claims awaiting adjustment		42,723.79
Profit and loss account:		
Balance June 30th, 1909	$361,066.01	
Profit for year ended June 30th, 1910	309,945.08	
		671,011.09
		$7,086,620.92

Assets

Mines, mineral claims, and shares in other companies	$4,142,181.12	
Expenditure on No. 7 group	22,207.31	
Expenditure on Phoenix Amalgamated group	55,840.82	
		$4,220,229.25
Mining, smelting, concentrating and refining plants:		
Balance June 30th, 1909	$1,498,639.04	
Construction for year to June 30th, 1910	215,143.14	
	$1,713,782.18	
Less sales of plant	$ 1,511.99	
Less depreciation	175,502.60	
	177,014.59	
		1,536,767.59
Smelter product on hand and in transit to refineries:		
Pig lead, bullion, matte, blue-stone and antimony	$170,437.30	
Ores and metals on hand and in transit to smelter at June 30th, 1910:		
Value of metal contents corrected to market quotations:		
Ores on hand	$349,472.02	
Refinery, metals on hand	281,686.10	
Ore in transit to smelter	11,337.77	
	642,495.89	
		812,933.19
Mine and smelter stores and material		353,600.99

Auditors' Report

We have audited the accounts of the Consolidated Mining & Smelting Company of Canada, Limited, for the year ended June 30th, 1910, including the mine and smelter accounts maintained at the offices at Moyie, Phoenix, Rossland and Trail, B.C. The inventories of ore and smelter products at June 30th, 1910, are as certified by the company's officials; the values of metal contents have been corrected to market quotations of that date, and the estimated cost of refining products in course of treatment has been deducted. Stores and materials on hand at the mines and smelter have been verified by the storekeepers.

Subject to the foregoing, we certify that the above balance sheet is, in our opinion, properly drawn up so

as to exhibit a correct view of the financial position of the company as at date of closing the accounts to June 30th, 1910.

Clarkson, Cross & Helliwell,
Chartered Accountants.

Vancouver, B.C., August 26th, 1910.

Profit and Loss Account

For year ended June 30th, 1910

To smelter product on hand June 30th, 1909, and in transit from smelter to refineries		$ 349,741.22
To ore in transit to smelter June 30th, 1909, and in process of treatment		754,644.20
To customs ore, lead and bullion purchased		1,666,504.23
To freight on ore from company's mines		200,950.28
To mining, smelting and general expense:		
"St. Eugene" mines	$ 441,234.61	
"Centre Star" mines	538,010.55	
"Snowshoe" mines	162,336.14	
"Richmond-Eureka" mines	21,232.93	
"Queen Victoria" mines	5,495.90	
"Sullivan" mines	18,774.73	
Trail smelter and refinery	1,521,381.46	
		2,708,466.32
To development expenses:		
"St. Eugene" mines	$163,276.69	
"Centre Star" mines	298,553.70	
"Snowshoe" mines	5,837.78	
"Richmond-Eureka" mines	21,045.07	
"Sullivan" mines	7,057.51	
		495,770.75
To royalty on ore		37,154.89
To depreciation general plant and equipment		175,502.60
To directors' fees		8,800.00
To sundry items written off (including bad debts)		13,988.64
To balance, profit		309,945.08
		$6,721,468.21
By sales of smelter products, ore, etc.		$5,904,004.90
By smelter product on hand June 30th, 1910, and in transit from smelter to refineries:		
Pig lead, matte, bullion, bluestone and antimony		170,437.30
By ores and metals on hand and in transit to smelter June 30th, 1910; value of metal contents corrected to market quotations:		
Ores on hand	$349,472.02	
Refinery metals on hand	281,686.10	
Ore in transit to smelter	11,337.77	
		642,495.89
By rents and sundry revenue		4,530.12
		$6,721,468.21

Managing Director's Report

Trail, B.C., August 15th, 1910.

To the Directors of the Consolidated Mining & Smelting Company of Canada, Limited:

Gentlemen,—I beg to submit the results of the Consolidated Company's operations for the year ending June 30th, 1910, including balance sheet, profit and loss account, production, and general report.

Financial Statement

After writing off $175,502.60 depreciation upon plant and equipment (as compared with $153,218.31 depreciation written off in the previous year), $13,988.64 sundry items including bad debts, and charging to profit and loss account $495,770.75 expended upon development, the operations for the year show a profit of $309,945.08, which added to last year's balance of $361,066.01, leaves a net credit of $671,011.09.

During the year additions to the various plants and the additional equipment of new properties have amounted to $140,977.05. The increase in the investment in lands near the smelter has been $6,704.10. The cost of new properties and their development has been $222,622.76 and the estimated value of plant included with the purchase of the Molly Gibson and Number Seven $65,950; a total of $288,572.76, paid for in stock $200,000 and in cash $88,572.76.

The total cash expended, therefore, upon the above items of property and plant was $236,253.91.

The Snowshoe overdraft guaranteed by this company, the balance of which at June 30th, 1909, was $16,549.12, has been paid in full by the Snowshoe Gold & Copper Mines from royalties on ore shipments, and the liability of this company thereby terminated.

The company's obligations for borrowed capital show a reduction in the year of $462,090.50, or from $1,228,103.10 to $766,012.60.

The quotations for London lead, New York silver, and electrolytic copper have been exceedingly low during the year, having averaged: London lead, £12.921, as compared to £13.249 during the previous year; New York silver, 51.948c., as compared to 51.410c., and electrolytic copper 12.981c., as compared to 13.254c.

Since the formation of the Consolidated Company, the cost of new properties acquired has been $1,142,181.12; additions to plant, including the acquisition of existing plants connected with new properties, have cost $1,235,942.20, making a total of $2,378,123.32. Treasury stock, issued in payment for new properties and plants connected therewith, accounts for $856,400 of this total, and the remainder, $1,521,723.32, was covered by cash expenditure.

Production

Following are the productions of the different properties controlled, leased and operated by the Consolidated Company for the year ending June 30th, 1910, and the total production to date as far as can be ascertained. It will be noted that the gross value of metals produced at the company's smelting works was $5,911,767, as compared to $5,505,526 during the previous year. There was an increase in the gold and copper production, a reduction in silver, and a slight falling off in lead; the total, in spite of low prices for metals, exceeds any previous year. The tons smelted increased from 347,417 to 487,125, the largest in the history of the company.

Year Ending June 30th, 1910

	Tons Ore	Gold in Ounces

The Centre Star Group is mining and shipping about 14,000 tons per month; the St. Eugene mining and concentrating 5,000 tons (from which 800 tons of lead concentrates are being produced); the Snowshoe, 10,000 tons; the Richmond-Eureka 300 tons; and the Sullivan 2,500 tons, making a total being mined per month of 32,600 tons.

Development

There are over 24.6 miles of underground development or narrow work in the Centre Star Group, Rossland; 18 miles in the St. Eugene, Moyie; 6,041 feet in the Richmond-Eureka, Sandon; 2,581 feet in the Phoenix Amalgamated, Phoenix; 5,277 in the Molly Gibson mine; 4,575 feet in the Sullivan mine, Kimberley; and 3,357 feet in the Number Seven mine, Central Group.

In the company's mines 28,144 feet or over 5 miles of narrow work, has been driven during the year, and 40,824 feet of diamond drilling as follows:

	Drifting and Crosscutting
Centre Star Group	13,165
St. Eugene	7,711
Sullivan	367
Richmond-Eureka	2,505
Number Seven	864
Total	24,612

Raising	Sinking	Total	Diamond Drilling
1,346	211	14,722	28,834
1,483	160	9,354	11,456
8	...	375	534
324	...	2,829	.....
.....	...	864	.....
3,161	371	28,144	40,824

In the Centre Star-War Eagle group, Rossland, new ore has been found upon the Centre Star, 3rd, 6th and 10th levels. No pay ore has been found below the 12th level. From the 16th level, 7,867.6 feet of diamond drilling has been done, without finding ore. One or two more holes will complete the exploration in the deep levels of the Centre Star.

There has been an improvement in the Idaho, during the year, both as to ore reserves and prospective value, due to the finding of a new ore shoot (470) above the 4th level and to the expansion of 539 stope, under 461 stope (above the 4th level).

Developments in the War Eagle continue to be encouraging, increased tonnages having been developed on the 8th, 9th, 10th and 11th levels. The ore body on the 9th level War Eagle, referred to in the previous report, has been located on the 8th level. Parallel to this ore body an entirely new ore shoot has been found on the 9th level. Stopes 1086 and 1155 have yielded a large tonnage. The country in which these ore bodies are located is not fully prospected. The future outlook for this part of the mine is most promising. On the 12th or bottom level War Eagle there are small streaks of ore, but nothing of importance has as yet been discovered.

The Iron Mask developments have also been encouraging, one ore body having been opened by a crosscut from the 4th level Centre Star, and a smaller ore body has been opened on the Josie vein from the 4th War Eagle level, considerably east of the old main workings. The stopes in the Iron Mask above the 4th level War Eagle look well.

The ore reserves of the Centre Star group are estimated at 245,640 tons.

No new large ore bodies have been found at the St. Eugene during the year, although a considerable amount of work has been performed upon the 2,100, 2,200 and 2,400 foot levels. The total number of feet of diamond drill holes driven from these three levels has been 8,683.6.

The ore reserves in the St. Eugene group are estimated at 20,000 tons.

While drifting upon the Richmond-Eureka has not opened up much new ore, yet indications are that a fair tonnage, not yet included in estimated reserves, will come from the Summit and No. 6 tunnel, from which no stoping has been done. The ore reserves in the Richmond-Eureka are estimated at 3,475 tons.

No new development work has been done upon the Phoenix Amalgamated and only a few hundred feet upon the Number Seven, mostly in broken country.

On the Snowshoe, upon which the company holds a lease, no new developments have taken place. The ore reserves in the Snowshoe are estimated at 84,000 tons of shipping ore and 93,000 tons containing copper, about 0.80 per cent., which is too low to be shipped at present copper quotations.

In order to determine the grade of the Queen Victoria ore and the cost of mining, trial shipments have been made. These operations have indicated that after sorting, ore containing copper 1.5 per cent. to 1.7 per

cent. can be shipped, but that it is unprofitable to work the mine until the price of copper is much higher.

CONSTRUCTION

The principal new installations or construction work at Trail during the year were a centrifugal pump with driving motor direct connected, located on the Columbia River; a plant for making bullion anodes from the lead blast furnace without re-melting; improvements in copper mills; additions to the lead refinery.

At the company's lime quarry at Fife, a new railway siding has been built.

In connection with the mines, the principal expenditures upon capital account have been for the following:

Ore testing plant for determining methods of economically treating ores and for devising improvements upon present methods in concentrating ores from the company's mines, a railway spur and tramway at the Phoenix Amalgamated property in the Boundary; the equipment of the Number Seven mine in the Boundary, including an aerial tramway with terminals, a short railway spur, a power line, and motors for driving the compressor.

The value of machinery and buildings at the Molly Gibson and Number Seven, which were included with the mining property in the agreements for sale, has been estimated at $65,950, and this amount has been charged to plant account.

NEW PROPERTIES

In order to maintain the company's earnings, it seemed advisable to secure such new properties as promised to yield a fair return upon the cost of the property, plus the amount necessary to equip them for economical operation, and providing always that there was a reasonable chance that such properties would produce a sufficient tonnage of ore to repay the capital expenditures incurred through their purchase and equipment. After examining a great number of mines and prospects, it was decided that the No. 7 mine in the Boundary and the Molly Gibson mine near Nelson were the most promising.

The Number Seven mine and some adjoining claims were therefore purchased. This property has a hoist, compressor, mine buildings, a shaft 325 feet deep, and a total of 3,357 feet of narrow work. It is estimated that there are developed 20,000 tons of ore containing about $10 gross assay value. An aerial tramway, electrical equipment and a railway spur are about completed.

After long negotiations, the Molly Gibson mine was secured by the payment of 2,000 shares of the company's treasury stock. The Molly Gibson Company owned an 8,000 foot aerial tramway, a concentrator, compressor and mine buildings. Former managements have driven 5,277 feet of narrow work. The ore reserves are estimated at 6,000 tons of ore containing a gross assay value of $30 per ton.

A lease has been taken upon the Sullivan mine near Kimberley. A royalty is paid upon all ore shipments, and the Consolidated Company has undertaken to perform $10,000 worth of development work. The mine is producing about 2,500 tons monthly of ore containing approximately, lead 18 per cent., silver 6.0 ounces per ton.

MANAGEMENT

The operations and business of the company have been ably directed by the following gentlemen:

R. H. Stewart, manager of the company's mines; T. W. Bingay, comptroller; A. J. McNab, superintendent of the smelter; John F. Miller, superintendent of the refinery; M. E. Purcell, superintendent of the Rossland mines; S. G. Blaylock, superintendent of St. Eugene mines at Moyie and the Sullivan mine near Kimberley; Charles Biesel, superintendent Phoenix mines and the Number Seven mine south of Phoenix; John Bakke, superintendent Richmond-Eureka mines; F. W. Guernsey, superintendent Molly Gibson and Queen Victoria mines; James Buchanan, metallurgist; A. W. Davis, assistant to the mine manager; and John M. Turnbull, mining engineer.

Mr. Jules Labarthe, who for many years has efficiently managed the works at Trail, resigned, to accept the general management of the Mason Valley Mines Company of Nevada.

Respectfully submitted,
W. H. ALDRIDGE,
Managing Director.

A UNIQUE SECTIONALIZED POWER PLANT.

The El Tajo Mining Company, of San Sebastian, State of Jalisco, Mexico, has recently ordered a unique sectionalized power plant to supply power for its new mill. The head of water available is 500 feet, and there is being supplied a special Pelton water-wheel of the two-unit type capable of developing 125 h.p. at this head when running at 1,200 r.p.m. With this water-wheel will be supplied two pairs of jaw clutch couplings, thus rendering it possible to disconnect either of the two generators which are driven by this wheel. The water-wheel will be sectionalized for mule back transportation and no piece will weigh over 300 pounds. A mechanical governor will be furnished to control the water-wheel.

The two generators to be driven by this wheel, as with all the electrical apparatus, come from the works of the Westinghouse Electric & Manufacturing Company, and will be of 50 k.w. capacity each. These also will be 3-phase, 60-cycle, 600 volts and run at a speed of 1,200 r.p.m. corresponding to the water-wheel. They will have extended shafts for belt driving the exciters. The generating station also provides for the usual switchboard, lightning arresters and protection apparatus.

The power generated is to be consumed at the mill by various alternating current motors, one of which, belt drives the stamp mill line shaft at a speed of 150 r.p.m., resulting in 100 drops per minute. The tube mill line shaft runs at 200 r.p.m., the mill itself making 37 revolutions per minute. Other motors are scattered about the mill for the usual drives in a mill of this kind.

Since the generating plant is located close to the mill, the generator gives 600 volts and the motors employed are for 550 volts. The lighting is taken care of by separate transformers.

The Uruguayan Republic last year provided for the coinage of $500,000 worth of metal money. The pieces are, respectively, 5-cent, 2-cent, and 1-cent. Twenty million pieces in all were provided for.

A new winder is being installed at the Micklefield Colliery, England. It is to be electrically operated, and will be capable of raising 150 tons of coal per hour from a depth of 300 yards. At every wind three tubs, each containing 12 cwt. of coal, will be raised. The winding period is set at 35 seconds, and the banking interval at about eight seconds. A balance rope will be used, and the parallel drum, 11 feet in diameter, will be driven directly by means of two continuous current winding motors.

Waterborne Packing of Stopes in the Transvaal

For some time past the question of packing the stopes solid has been attracting attention on the Rand and the adoption of the waterborne system is being seriously considered, several of the principal mines, both outcrop and deep level, being busily engaged making experiments in connection therewith. The system is not by any means new, but up to the present it seems to have been principally used in connection with the working of the thick coal seams in Silesia.

The Rand gold mines have hard, cohesive, unyielding quartzite hanging walls and near the outcrop small pillars will suffice, but now that the working costs have been so reduced it has been found profitable to extract the whole of the pillars hitherto considered unpayable, but the difficulty very often has arisen of finding suitable stowing material. Owing to this several nasty falls of the hanging have taken place and down to a depth of six hundred feet these falls have generally worked their way to the surface, and it is probable that at even greater depths it is only a question of time before the surface over these open stopes will also become affected.

Several of the deep mines on the Rand have now attained a depth of between four and five thousand feet and there are indications that at this depth the pressure of the superincumbent strata is a coming difficulty to contend against, and, if successful, the waterborne system of sand filling the stopes promises to afford the Rand mines an easy and cheap way out of the difficulty. As an illustration of the difficulties of deep mining the Cinderella Deep accident may be quoted, where sixteen natives lost their lives through the collapse of a large pillar at a depth of 4,000 feet from the surface. This is one of the few mines allowed by the government to work with a single shaft or outlet, and this permission can only be obtained on extraordinary steps being undertaken with the view of the prevention of accidents, so that at this mine the discipline must be of an exemplary character. However, the other evening at nine o'clock, whilst a white overseer and over twenty natives were working as usual in the 4,000-foot level, a loud report was heard, and a large pillar collapsed, killing sixteen natives and injuring several others, without the slightest warning. A government enquiry was held into the accident and the cause attributed to the excessive pressure of the superincumbent strata at this depth. Several managers on the East Rand, however, still hold the view that with such a cohesive hanging wall, a pressure of the nature required could not have resulted from depth alone, forgetting the fact that under the circumstances a cohesive unyielding hanging wall is the most likely to break in large masses and, thus, bring about such an accident. Now, from actual experiments made with the Rand quartzites it would seem that they fracture at pressures varying from 1,945 to 6,804 pounds to the square inch and with an average pressure of 4,566 pounds to the square inch, and, as at a depth of 4,000 feet from the surface, the actual weight of the overlying strata, would be 4,888 pounds, a pressure nearly equal to the weight of the whole thickness of the overlying strata, must have been thrown on to the pillar. It is difficult to see how in a comparatively new mine like the Cinderella Deep, such a condition of affairs could have been brought about, but the fact must not be overlooked that stoping operations throw extra weight upon the pillars, and the extraction of one-half the reef by means of stopes doubles the work cast on to a pillar, so that at this great depth unusually heavy pressures are possible. An overlap fault also exists in the locality and it is possible that this may have had something to do with the accident. However, it is becoming evident that nearer the outcrop, where it is found profitable to extract the pillars, and in depth, where the superincumbent pressure is beginning to show itself, solid filling of the stopes is absolutely necessary and it is due to these reasons that the sand filling process is being extensively tried.

One great advantage on the Rand is the existence of thousands of tons of old tailing sands sufficient to last for many years in close proximity of water and sand to produce a ready flowing mixture, whilst a fall of 1 in 10 is considered the minimum. With such a fall the sand and water readily flows to the shaft, but where the sands lie below the level of the shaft some mechanical means of transport must be used. In such a case bins or hoppers are built near the shaft and the sand mixed with water and then conveyed by six-inch pipes lined with hardwood down the shaft and to the spot in the stope at which it is intended to deliver the sand. Wherever possible the use of launders is preferred as being simpler and less liable to choke, but they must have a minimum gradient of 1 in 10. For vertical and horizontal lines pipes are essential, but the horizontal lines need a head of at least 3 to 1 to keep the waterborne material moving, whilst rising lines of pipes are to be avoided. Of course, some preparation is necessary in the stope before the deposition of the sand. All openings must be closed at the lowest point, either by building water-tight tracks or barricades, the water escaping from outlets formed at the side as the stope becomes gradually filled with sand. Too much pressure must not be thrown against the artificial barricades or packs and, for this reason, the receiving stope should have length in preference to height, but by building packs the depositing of the sand can be regulated at will. To ensure that the overflow water, before reaching the pumps is clear of sand, it may be necessary to construct catch pits or weirs, whilst to protect the pumps and pipes against the action of any cyanide a small proportion of lime is added.

This question of the tailings still containing cyanide has been fully gone into, and to avoid such an occurrence as much as possible, only old tailings are being used, of which there is an ample supply at most of the mines to last for many years. Experiments are also being made with the object of destroying any cyanide the tailings may contain and considerable success has attended those experiments, for although entire destruction of the cyanide in fresh tailings has not been achieved, Dr. Irwin, the chemist to the Transvaal Government Mines Department, has succeeded in reducing the cyanide to three or four parts per million, which ought to be sufficient for all industrial purposes. So far when once a stope is properly filled the shrinkage by continued drainage does not seem to be sufficient to materially interfere with the success of the system whilst with regard to the quantity deposited in the stopes no difficulty is being experienced at the Village Deep in sending into the mine 200 tons of sand per hour. It is not anticipated that the cost will exceed two pence to four pence per ton, as this is the cost at one of the mines where the sand filling process was carried on under favourable conditions for some time on a small scale. It is not unlikely that if proved successful the sand filling process may in a sense revolutionize mining methods at present employed on the Rand.

ROWLAND GASCOYNE.

Personal and General

Mr. C. McK. Campbell, head mining engineer for the Granby Consolidated M. S. & P. Company, has returned to his post at Phoenix, B.C., after having spent a month's vacation visiting Winnipeg, Montreal, and other places.

Messrs. James McEvoy, of Toronto, and R. G. Drinnan, of Vancouver, B.C., both well known coal mining engineers, have been engaged during the summer just past in locating, for a Toronto syndicate, coal lands in the country west of Edmonton and north of the Brazeau district, Alberta. Mr McEvoy returned to Toronto last month, and Mr. Drinnan to British Columbia.

Mons. A. Fournier, of Kaslo, B.C., manager for the Selkirk Mines, Ltd., a French company owning the Cork mine and concentrating mill on the south fork of Kaslo Creek, has, after some delay, received from France, the Medal of Merit, for valour and discipline. Mons. Fournier served 16 years in the French army, and now holds the rank of captain in the reserve.

Mr. Robert R. Hedley is investigating a gold-copper mine in the vicinity of Alberni Canal, Vancouver Island, B.C., which is under bond and option of purchase to a Vancouver syndicate, for whom he is acting.

Mr. Wm. Fleet Robertson, Provincial Mineralogist for British Columbia, who recently returned to Victoria from a trip through the Lillooet country, has gone to Portland Canal to make investigations there in his official capacity.

Mr. W. W. Leach, who has spent the field-work season of this year in the Skeena district, British Columbia, is expected to return to Ottawa during October.

Mr. R. P. Williams, western representative of the Canadian Rand Company, Limited, last month returned to his headquarters at Vancouver, B.C., from a trip to Whitehorse and Dawson, Yukon Territory, and thence to Nome, Alaska.

Mr. Charles Graham, formerly one of the underground managers for the Western Fuel Company, with large coal mines near Nanaimo, Vancouver Island, B.C., has been appointed superintendent of the Nicola Valley Coal & Coke Company's Middlesboro colliery, in the Nicola Valley, B.C., in succession to Mr. James Gray, resigned.

Mr. Newman Erb, of New York, president of the British Columbia Copper Company, Limited, has been visiting the company's mines and smelting works in the Boundary district, British Columbia.

Mr. G. G. S. Lindsey, of Toronto, lately paid a visit to some mining property in the Portland Canal district, British Columbia, in which he is interested.

Mr. A. B. Stewart, formerly manager of the Chester Basin gold mine, Nova Scotia, is at present in Porcupine.

Mr. H. C. Meek, superintendent of the Dome mine, Porcupine, is at present in the West.

Mr. J. B. Tyrrell has been appointed consulting engineer in Canada for an important English mining company that has heretofore confined its operations to South Africa.

Mr. J. McEvoy has returned to Toronto from the West and has taken an office in the Stair Building.

SPECIAL CORRESPONDENCE

ONTARIO.

Cobalt.—Mr. Lorne McGibbon, president of the La Rose Consolidated, recently stated that the proposed amalgamation of the more important Cobalt properties, was further away now than it had been a few months ago. This is due to the stronger position of the La Rose, which has made important gains on the No. 3 vein of the original mine, and also on the Lawson and Princess claims. One of the best discoveries of the year was made a short time ago on the Princess and subsequent development serves to increase its importance. At the recent annual meeting the directors declared the regular quarterly dividend of two per cent. payable on October 20. It was anticipated in certain quarters that the dividend rate would be raised, but the management has decided not to take such action until the properties have been more thoroughly developed. Although no official notification has been issued, it is known that the annual report, which will shortly be in the hands of the shareholders, will be very favourable.

The shaft on the Dreadnought property formerly known as the Rothschild, is now down 150 feet, and from this point crosscuts will be run under the lake. A couple of calcite veins have been located, and a considerable quantity of float nuggets have also been found.

The raise from the 288 to the 190 foot level of the Cobalt Lake Company, has been finished and it was in ore all the way. The vein is about two inches in width of high grade ore, and the values extend for some distance into the wall rock.

Surface work has been started on the Bartlett property in Gowganda, with the result that one of the best veins in the country has been found. A small shaft has been started and at a depth of eight feet the vein showed seven inches of high grade ore. This company has some of the best claims in Gowganda, and if conservatively managed there is every reason to believe that it may make good.

For some time the Ontario Department of Lands, Forests and Mines has been collecting data regarding the water power available in the northern parts of the province. The water powers of Northern Ontario figured largely in these estimates, which totalled an aggregate of 2,000,000 horse power. The powers in question are located over a distance of approximately 600 miles, occurring principally along the main tributaries of the Moose, Albany, Winnipeg and Rainy Rivers, which drain northward into the Hudson Bay. Some of these powers range from fifty to one hundred thousand horse power, and form a tremendous reserve that can be turned into electric energy. It it believed in some quarters that it may eventually be used for the electrification of the Grand Trunk Pacific.

The Northern Customs Concentrator has installed two more Nissen stamps, so that they now have in operation fifty regular stamps and four Nissens. This gives the mill a capacity of 160 tons a day, so that it is with the Coniagas treating the largest tonnage of any mill in the district. At the present time it is handling ore exclusively from the La Rose and City of Cobalt mines, and these contracts alone are sufficient to keep the mill in operation several years. The La Rose ore is all coming from underground operations, none of it being from the big dumps.

All Cobalt mines operating concentrators have received notification from the president of the Lord's Day Alliance that they must close down at 12 o'clock Saturday nights for the 24 hours' Sabbath rest. The general practice has been to close the mines down but to run the concentrators till about seven in the morning, and then to start up again at seven o'clock Monday morning. If the Alliance forces this action on the mill oper-

ators it will be extremely inconvenient and cause considerable loss. The Mine Managers' Association has taken the matter up, and written the Alliance, showing that the men obtain 24 hours' rest, and that to force the mills to shut down at twelve o'clock Saturday night would be a hardship both to the employees and the companies.

With regard to the Cobalt Central, the Referee in Toronto has decided that the question of selling the properties of the company will be definitely postponed till December 28th. He has also ruled that in the meantime all those connected with the former management shall be subpoenaed to Toronto, in order that their actions suggesting the liquidation of the company some months ago may be gone into.

Further exploration in the vicinity of the No. 1 shaft of the Trethewey has opened up two stringers of high grade ore that will give a stoping width of approximately fourteen feet. The greater part of the ore for the mill is coming from Nos. 2 and 4 shafts. The northern end of the property has been showing up exceedingly well and there are now five high grade veins showing in the No. 4 workings. The concentrator is treating over 100 tons a day, practically none of which is coming from the dumps.

A new shaft is being put down by the Coniagas, from which a crosscut will be run to explore the southern half of their property. The sinking is being done on a lot belonging to the Cobalt Central close to the boundary and is about 600 feet distant from the nearest working of the Coniagas. This section is in the conglomerate but no surface finds of any importance have been made.

At the Wyandoh mine, silver has been encountered at a depth of 135 feet. From the 80 foot level a winze was sunk on the vein, which at that point was barren. At a depth of 45 feet, however, the calcite changed to smaltite, which carries some silver values.

The Little Nipissing has obtained a lease of the ground on which the Peterson Lake Company started their shaft, and they will work this lease from their own shaft. Some of their veins carrying high grade ore have been found to lead into it. The lease is for seven years and the Little Nipissing has to pay a bonus of $10,000.

The Trethewey Company has declared a dividend of 10 per cent., payable October 15th.

Good results are now being obtained on the Provincial, and some fine ore is being taken from the 175 foot of the No. 2 shaft. At this point there are two veins showing high grade ore and a crosscut is being run to the south to intercept a promising surface vein. An ore house will shortly be erected, that will contain a small concentrating plant, to reduce the ore. The management expects to ship a car each, of high and low grade in about a month. This will be the first shipment from the property for a couple of years.

At the annual meeting of the T. & H. B. Company, held Sept. 26th, two reports were submitted, one from the original company and the other from the Hudson Bay Mines, the operating company. The former showed that $148,169.05 had been received from the sale of ore, while the latter showed receipts amounting to $383,451.60. The directors have tried unsuccessfully to float the stock of the Hudson Bay Mines, which is capitalized at $3,500,000, so that it is extremely improbable that the stock will be distributed among the shareholders of the parent company, as was originally intended. The construction of the new concentrator is being held up on account of the failure to deliver the machinery.

Recent heavy rains all over the district have greatly retarded surface development and assessment work. Practically every day for the past three weeks rain has fallen to such an extent that the Montreal River has risen over two feet.

Porcupine.—The township of Shaw has lately been coming into prominence on account of several reported discoveries of free gold. A good many prospectors have been into that section, and there have been several sales of undeveloped claims.

The main shaft of the Scottish Ontario Company is now down 100 feet, and from this point crosscuts will be run to open up the four veins discovered on the surface. It is probable that during the winter a couple of stamps will be installed for sampling purposes.

The Homer veteran claim in Tisdale has been sold to New York capitalists.

The owners of the Vipond property have decided to install a small steam plant and a single stamp for sampling purposes. There are two veins showing on the surface and samples from these show good values in gold. Two shafts are being sunk, but work has been greatly hampered on account of the shortage of supplies. There are at the present time five tons of ore on hand, which assays about $1,000 to the ton.

Four claims known as the McIntyre properties have been sold to New York men. Machinery and supplies will be taken in during the winter.

An important discovery has lately been made on the Armstrong-McGibbon properties while the assessment work was being done. The find was made about 150 feet from the boundary line of the Crown Chartered and the showing of free gold is as spectacular as any seen in the district. Several small test pits have been sunk on the vein and they show free gold in the bottom.

Active mining operations are shortly to be started on the Bilsky properties which are owned by New York and Montreal men who are closely identified with the Jacobs Exploration Company. It is stated that some promising veins have been found.

The freight from Kelso to Porcupine is arriving in greater quantities than formerly and it is also being looked after better. It is anticipated that there will be several hundred teams on the road this winter.

BRITISH COLUMBIA

The total tonnage of ore received at the Kootenay and Boundary district smelteries during nine months to September 30, is in excess of 1,500,000 tons. The aggregate tonnage mined during that period is larger, though, by probably 150,000 tons, this quantity representing ore either concentrated or milled. Then there is a small tonnage from Coast district mines to add, ore having also been smelted at the Tyee Copper Company's works on Vancouver Island, and other British Columbia ore sent to Tacoma, Washington, for treatment.

The annual general meetings of several British Columbia mining and smelting companies will have been held before this shall be printed. The more important of these are that of the Consolidated Mining and Smelting Company of Canada, Limited, called for September 27th, and that of the Granby Consolidated M. S. & P. Company, for October 4th.

Cassiar.—A press despatch dated Atlin, September 27, is as follows: "John P. Lamb, employed for a number of years by the North Columbia Gold Mining Company in cleaning bedrock, was arrested by Chief Constable Owen on Friday, 23rd inst., and charged with stealing gold. He afterward appeared before Magistrate J. A. Fraser and was committed for trial. Some time ago two native children playing behind Lamb's cabin found a small tobacco tin containing more than 13 ounces of gold in nuggets. Later, the police found 3 ounces more in his cabin. When they arrested Lamb, they recovered 47 ounces of amalgam valued at more than $700, which had been cached under a stump near Taku, and the hiding place of which had been disclosed by Lamb." The North Columbia Gold Mining Company is a Cincinnati organizaztion, of which Mr. J. M. Ruffner is manager. It operates on a larger scale than any other company in Atlin camp, hydraulicking extensively on Pine Creek in gold-bearing gravel in places 45 feet in depth and much of it yielding gold to the value of 40 cents a yard. Its water supply

ditch is five miles in length and of a stated capacity of 15,000 miner's inches. Much of the gold recovered is coarse, and it is reported that included in this season's yield was a nugget of 27 ounces in weight.

East Kootenay.—The gold mining season is drawing to a close on Wild Horse, Perry, and other streams in East Kootenay on which placering is carried on so long as weather conditions permit and sufficient water is obtainable. Lode mining at the St. Eugene and Sullivan lead mines, respectively, continues to constitute the chief feature of this branch of the industry, operations at other mines being small in comparison, and not yet productive of much ore for shipment. The output of the St. Eugene for nine months, to September 30, has been between 11,000 and 12,000 tons of lead-silver concentrate from 80,000 to 90,000 tons of ore, and from the Sullivan about 14,000 tons of crude ore. Both mines are worked by the Consolidated M. & S. Company, and both ship their product to that company's smeltery at Trail.

In coal production, the Crow's Nest Pass Coal Company has been maintaining a large output, the tonnage for the month of August having been 109,000, as compared with 73,000 tons in the corresponding month of 1909, this showing an increase in output of nearly 50 per cent. Both the Hosmer and Corbin collieries are also producing coal in considerable quantity, though on not nearly so large a scale as the Crow's Nest Pass Coal Company. Prospecting the coal measures in the upper Elk River country, north of Michel, is being proceeded with, and too, in the Flathead country, in the southeast corner of the province. Both these new districts are likely to have railway transportation next year.

West Kootenay.—In Ainsworth division, the mines on which work is being done are the several that have had mention in recent numbers of the Journal. Two or three others are expected to shortly resume after having been idle for a time. The list includes the Highlander, Highland, Blue Bell, several mines up the south fork of Kaslo Creek, and one at Poplar Creek. Wagon road communication has been established with McGuigan, Bear Lake, and Whitewater, so that building materials have been received at the Whitewater, Lucky Jim, and Rambler-Cariboo mines, and mining has been resumed in the last mentioned. It is intended to haul ore from both the Rambler-Cariboo and Lucky Jim to the C.P.R. at Three Forks, for shipment thence to smelteries. The Slocan Star, near Sandon, has lately been shipping some ore after a long period of practical non-productiveness, last year's output having been only 64 tons. The fact that ore is being again shipped has given rise to the statement that work was only lately resumed after a long period of idleness, which is an error. It is true that during several years no work had been done in the old workings affected by the Star vs. White litigation, happily finally settled last November ,but work has been in progress on the other side of the Star gulch with little intermission for two years or more. In 1909 about 1,550 feet of underground development was done, beside surface trenching and other prospecting work. This mine was visited last June by the writer of these notes, and shortly afterwards the following information relative to it was published: "The Slocan Star and Richmond-Eureka are both interested in the further extension of the latter's No. 6 tunnel. This was started on the Eureka claim; at about 500 feet in it entered the Hidden Treasure of the Slocan Star group and has been driven about 500 feet in that claim. At 200 feet farther ahead, or 1,200 feet from its portal, it will be in the Summit claim of the Richmond-Eureka group. An incline raise is being made in the vein from No. 6 to Eureka No. 5, a distance of 170 feet. This raise is up nearly 90 feet and it is expected it will be through to No. 5, which passes through one corner of the Hidden Treasure, early in July. A tunnel has also been driven on the vein about 200 feet lower down than No. 6, on the Slocan King claim of the Slocan Star group; this has passed through into the Hidden Treasure, and its breast is about 1,600 feet from its portal. Three shoots of ore have been passed through, and it is expected that another shoot, opened in Nos. 5 and 6 above, will be reached at about 1,800 feet in from the portal of this King tunnel. The chief purpose now is to get the two drifts well into the mountain (to cut several ore shoots known to occur in No. 5), and to connect them by raises to ensure good ventilation. When this shall have been done the miners will go back and cross-cut wherever deemed advisable, and stopes will be opened in the ore shoots." The account also described some aerial tramway improvements being made, and concluded thus: "The give-and-take arrangement between the two companies concerned makes it practicable to work their adjoining claims at less cost than if operated independently one of the other. As practically all of the ore from the workings above-mentioned can be shipped crude to the smeltery, it now appears unlikely the Slocan Star concentrating mill will again be operated until work shall be resumed in the old workings of the Slocan Star mine, which may not be done this season." This information will serve to show that instead of being "tied up" as mistakenly chronicled in Nelson, much development work has been in progress on the Slocan Star property during the last two years, with results that may be expected to allow of shipment of a lot of ore of good grade whenever the management shall deem it advisable to make shipments regularly to the smeltery.

In the Slocan Lake section of the district, developments at the Standard and Hewitt mines are regarded as satisfactory, with large shoots of ore opened ready for stoping. The Van Roi, in the same neighbourhood, is also being put in condition for maintaining an output of ore continuously; meanwhile the erection of a concentrating mill is being proceeded with. About Nelson, the Molly Gibson silver-lead mine, for several years known as the La Plata, is being worked by the Consolidated M. & S. Company, with Mr. A. W. Davis in charge as superintendent. The Athabasca gold mine is reported to be developing encouragingly. An announcement has been made of the intention of a syndicate to acquire and work the Silver King, Dandy, and other properties situated on Toad Mountain, near Nelson. In Ymir camp, the Yankee Girl, Wilcox, and Dundee mines are being worked, but only the first-named is producing ore in considerable quantity; it has this year sent to the Trail smeltery more than 4,000 tons. In Sheep Creek camp, The Queen and Nugget are keeping their respective stamp mills going, while the Mother Lode is being developed to a greater extent than other claims in the camp, though not taking out ore except that broken down in the course of development.

In Rossland camp, beside the larger mines—Centre Star group, Le Roi, and Le Roi No. 2—there are the Cliff, lately bonded to the Granby Company; the Mayflower, and the Blue Bird, and from these three results are expected that it is hoped will admit of their becoming regular shippers of ore to Trail. Resumption of work on the Beatrice silver-lead mine, Lardeau district, has been announced, while the Silver Cup, also in northern Lardeau, is sending ore out and now has a total production for the current year of about 900 tons of high-grade ore.

Boundary.—Shipment of ore from the Rawhide mine to the B. C. Copper Company's smeltery at Greenwood was commenced during the week ended September 17. This mine is one of the Dominion Copper Company's properties; some time ago its production was comparatively large and the ore was sent to the Boundary Falls smelting works. Publication of the reports prepared for presentation at the annual meeting of the Granby Consolidated M. S. & P. Company in New York on October 4, is being awaited with much interest. It is stated the company's net earnings during the fiscal year ended June 30 last, have been equal to $4 per share. As there are 150,000 shares in the company, this would mean a net profit for the year of $600,000. The British Columbia Copper Company is reported to have cash in hand and due for copper delivered, to the amount of about $250,000. Beside this, there is the value of copper in transit—

about $50,000. The Phoenix Pioneer is authority for the statement that "when the company shall have $500,000 in actual cash, the management propose to place the stock on a dividend basis." The aggregate tonnage of ore produced by Boundary mines during nine months to September 30 is given at about 1,260,000 tons.

Texada Island.—The general average value of the ore produced at the Cornell mine, near Van Anda, Texada Island, by the Northern Texada Mines, Limited, during seven months of this year, to August 31, is higher than that of last year's production, as shown by the following figures: In 1909 the production tonnage was 10,178 tons of ore, having an average metal content of: Gold, 0.297 ounces and silver 1.38 ounces per ton, and copper 3.78 per cent. During the seven months of 1910 the production was 4,301 tons, having an average metal content of: Gold, 0.407 ounces, and silver, 1.73 ounces per ton, and copper 4.47 per cent.

Portland Canal.—The mining properties on which the chief work is being done are those of the Portland Canal, Stewart, and Red Cliff companies. The Portland Canal Company's concentrator will be at work in October, and profitable results are looked for with confidence, there being much ore of good trade available for concentration. The Red Cliff Company is driving a long deep-level tunnel to cut at a considerable depth a shoot of copper ore opened by an adit at a higher level. This tunnel will soon be in about 100 feet from its portal.

Skeena.—Reports are published of the occurrence of silver-lead ores in several parts of the district about Hazelton, and of others in the Babine range, farther east. Samples of ore shown are of good grade, and the development of several silver-lead mines is expected.

Queen Charlotte Islands.—The work of prospecting the coal measures on Graham Island of the Queen Charlotte group is being proceeded with. Several companies have been organized to develop the coal resources of this island, and it is claimed the outlook for successful results is promising.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax, Oct. 9.—The troubled mining centre of Springhill had unlooked-for excitement during the past week. Following the injunction granted by Judge Drysdale, which virtually stopped picketing , a period of lethargy set in. Men came to Springhill and found employment with the company without interference by the strikers. Last week the scene changed. James D. McLennan, provincial organizer of the U. M. W. from Glace Bay, arrived in Springhill early in the week. A mass meeting of strikers was held behind closed doors, and the morning following picket duty was resumed in greater force than ever before. Those of the strike breakers who did not live behind the palisade had to run the gauntlet of from three to six hundred men. The company acted quickly, and had warrants issued for eight of the principal U. M. W. leaders. The men arrested were J. D. McLennan, provincial organizer; J. B. Moss, of the Nova Scotia U. M. W. Executive; A. C. Bonnyman, president of the local lodge; Emile Michelson, Lionel Dobar, Richard Richardson, W. A. Mattix, and David Colwell. The last mentioned is an elder of the Presbyterian Church, and one of the most highly respected citizens in Springhill. The trial was called for Saturday afternoon before Stipendiary Ross, but before any evidence was taken an adjournment was made until next Saturday at 10 o'clock. Mr. Moss expressed the view that the men would ultimately win out, that the mines could not be successfully operated by the class of labour employed, that the longer the company operated under existing conditions the more money it would lose.

Over against the statement of Mr. Moss must be set some hard facts viz., the company is steadily increasing its coal output, it has about as many men employed as it desires, and, while a portion of them are far from desirable citizens, many are from Glace Bay and other Cape Breton collieries, and are experienced miners. There is no sign of yielding on either side.

NEW BRUNSWICK.

St. John, N.B.—Messrs. Charles Russell and H. E. Tiebur, representing large oil refining interests in the United States, after a careful inspection of the oil shales in Albert City, have made an offer to Senator Domville, representing the General Oil Shales Company of Canada, which holds large areas in Albert county, to purchase the entire product of the property for 25 years or more at a fixed price, for the purpose of refining the oil.

The proposition of Messrs. Russell and Tiebur is to build a refinery either at Hillsboro or St. John, preferably at St. John, connecting it with the mines by a pipe line 80 miles long.

Senator Domville will lay the proposition before the General Oil Shales Company, which is composed of English capitalists.

ALBERTA.

Coleman, Sept. 29.—An accident occurred on Tuesday at the International Coal & Coke Company's mine when M. Pieblado, an Italian, was unfortunately caught between two coal waggons and had his side crushed. He was taken to the miners' hospital and is progressing favourably.

BRITISH COLUMBIA.

Vancouver.—Since the first discovery of coal on Graham Island by Mr. Robertson, of Victoria, a syndicate has been formed with a capital of $1,000,000, which has acquired 43,500 acres of coal lands on the north end of the island and round the Masset Harbour district. The company has taken out mining licenses from the Provincial Government and will develop its holdings on a large scale.

Vancouver, Oct. 1.—A ten million dollar merger covering all powder companies in the Dominion has just been formed, the only concern outside the deal being the works of the Giant Powder Company of San Francisco, located at Telegraph Bay on the island. The new company is known as the British Columbia Explosives Limited. The merger is controlled by the Nobel Company, operating powder plants in every European country, and the Dupont Company controlling the industry in the United States. The plant of the Hamilton Powder works near Nanaimo, and of the Western Explosives Company on Bowen Island, figure in the deal and representative interests are now here inspecting the properties. It is understood that the amalgamation was arranged to put an end to keen competition and in future each company will operate within definite limits.

YUKON.

Dawson.—Dawsonites now making the journey five miles from Dawson over the Hunker Boulevard to a point a mile this side of Bear Creek can see in the making the largest gold recovering machine ever designed. Not in the history of man has there been such a mammoth machine built to recover gold.

The Canadian-Klondike Mining Company, Limited, is building the giant dredge.

President and General Manager Joseph W. Boyle has more than 100 men engaged on the construction, rushing the work

day and night. During the hours of darkness the numerous electric arc lamps make it almost as light as day, and the work progresses without a hitch.

At the rate the undertaking is being pushed along, the dredge should be finished and receive the juice before the end of the season. The outlook now is that the big machine will have ample time for a thorough test before the closing of the dredging season.

The dredge is to be known as the "Canadian." The name is taken from the first part of the company's name. Large metallic name plates are prepared to be placed on the side of the house.

The cost of the dredge will run between $300,000 and $400,000. The freight on the machinery alone, to say nothing of the penalties to be added because of the enormous size of many parts, will reach something like $100,000.

The dredge will be driven with power from the new plant now being installed on the north fork of the Klondike by A. N. C. Treadgold. The giant motors for the new dredge are on the ground. No transformers are to be used on the dredge, and every wire going aboard the boat will be absolutely insulated, and the craft thus fully protected from fire risk.

The digging line will have a 300 horse power motor, and will be guaranteed to stand an overload of 50 per cent. A 200 horse power motor will operate the ladder hoist. The total capacity of the motors is 1,000 horse power. The motors were designed especially for this work by the General Electric Company.

The digging ladder and the stacking ladder have steam heating apparatus especially designed to keep the ice from interfering with the work. Other machines have much trouble from ice on these parts, especially late in the fall.

With this new device for warding off of ice, Mr. Boyle calculates on being able to dredge 200 to 215 days.

The Canadian will have a capacity of 10,000 cubic yards a day. The company's dredge No. 1,now at work on the Klondike, has a capacity of 4,000 yards. The big dredge will handle 15 cubic feet of material with every bucket.

The second largest gold dredge in the world is the Natoma No. 1, in California. Its buckets are a little more than 13½ feet each.

MINING NEWS OF THE WORLD.

NEWFOUNDLAND.

St. John's.—The company which has been prospecting near Parsons Pond, Nfld., has struck oil and will proceed with development operations immediately.

The Steamer Harlaw, which sails on Tuesday from Halifax, will have almost a cargo of equipment for the Parsons Cove concern this trip, and is loading the goods at G. S. Campbell & Company's wharf now. They came from New York by the Florizel and Bornu and include two three-ton boilers and attachments, heavy steel drills, an immense lot of iron piping, derricks, timbers, etc., for the development work; also a large quantity of flour and food supplies.

UNITED STATES.

Los Angeles, Cal., Sept. 30.—The American Mining Congress placed itself on record yesterday as opposed to the Roosevelt and Pinchot conservation policies, and by a vote that was practically unanimous declared in favour of state control of water power and all other natural resources as against federal control.

As indicative of the attitude and sentiments of the delegates in the matter of national conservation of natural resources, the congress accepted a report of the committee on Alaska mining laws in which L. R. Glavis, the land office special agent dismissed by Secretary Ballinger, was attacked, and applauded a delegate who denounced Colonel Roosevelt's attitude on conservation.

Los Angeles, Cal., Oct. 3.—It is officially stated that the report of an agreement between the Associated Oil Company and the Independent Producers' agency for the sale of 10,000,000 barrels of oil to the Associated is premature. No such deal has been perfected, although it is admitted that negotiations are under way. The difficulty in closing the deal appears to be in the price, the agency demanding at least 35 cents per barrel, and the Associated refusing to pay more than 30 cents.

Cripple Creek, Colo.—It is learned that 48 new applications for leases have been filed since the announcement of the United States Reduction & Refining Company's big cut in ore treatment charges, and the holdings of these nine corporations represent less than 11 per cent. of the ground in that section of the district known as the mineral belt. To place the present number of applications at 200 in covering the entire camp would be conservative, as mining men declare they are besieged by men after leases, and at this time it is predicted that the reduced treatment rates will result in an ore tonnage increase of at least 10 per cent. before the expiration of 30 days.

Cripple Creek, Colo.—The output of the Cripple Creek district for September, compiled from figures given out by mill managers, was 68,570 tons, with a gross bullion value of $1,314,838.50, being a slight increase in money value over August, with a decrease of 230 tons handled. The figures follow:

Mill.	Tonnage.	Av. value.	Total.
New Portland	8,650	$ 3.55	$ 30,718.50
Wild Horse	1,000	3.00	3,000.00
Stratton's Independence ..	7,800	3.60	31,040.00
Smelters	4,120	65.00	267,800.00
Portland	9,000	20.00	180,000.00
Golden Cycle	25,600	30.15	515,840.00
U. S. P. & R. Co.	12,400	23.10	286,440.00
Totals	68,570		$1,314,838.50

Danville, Ill., Oct. 6.—One hundred and fifty men were entombed in the Hartshorn coal mine, which took fire near this city to-day. All of the miners were taken out safely. The fire is confined to the lower levels and the managers say there is no danger.

New York, Oct. 1.—Returns of copper exports to Europe in September show that sales of the metal abroad the present month were the largest in more than a year. Not including the shipments made yesterday, exports of the month have totalled 31,630 tons, which compares with 27,976 tons in August and 22,875 tons in July. Not since the summer of 1909 have any one month's exports been equal to those of September.

The present month's large total was the result of the buying movement which gathered considerable headway in August, when it was announced that production of the metal was to be curtailed. Since that movement came to a stop, the copper market has been very quiet.

SOUTH AMERICA.

Colombia.—The American Vice-Consul at Barranquilla reports that the discovery of petroleum by a Canadian company near the town of Tubara, Colombia, has led the company to take steps to prospect extensively for the fluid. A large quantity

of American equipment has been ordered and operations are to be commenced almost immediately.

AUSTRALIA.

The discovery of gold in payable quantities in Australia dates back to 1851. From that year to the end of 1908 gold was raised to the value of £501,474,770. Silver was discovered in Australia as early as 1839, but was not worked until 1864. The mineral mined to the end of 1908 was, in conjunction with lead, valued at £57,993,423. The total mineral production of the Commonwealth to the end of 1908 was valued at £714,903,750. The total is made up as follows: Gold, £501,474,770, silver and lead, £57,993,423; copper, £51,863,038; tin, £26,749,012; coal, £63,454,277; other minerals, £13,369,230. Queensland's contributions to those figures were: Gold, £68,277,156; silver and lead, £1,753,314; copper, £6,313,083; tin, £6,959,156; coal, £4,121,425; other minerals, £1,276,262.

GREAT BRITAIN.

The Cambrian Colliery Combine men, who number 12,000, decided to go out on strike on Sept. 19th.

This decision is directly opposed to Saturday's conference at Cardiff, at which it was decided to take a ballot of all South Wales miners as to whether there should be a general stoppage in sympathy with the Cambrian men or whether the latter should be supported by a levy. Those who represented the Cambrian men at the conference undertook that they should continue at work pending the taking of the ballot. In deciding to cease work the men have flouted those who represented them and gone contrary to the advice of their leaders.

It is feared that the owners may retaliate by locking out the whole of the men in the South Wales coalfield. The owners see indications of a general stoppage in the not distant future, and are believed to prefer to enter upon the fight at once—if there is to be a fight—rather than await the convenience of the miners' leaders. Hence it is feared they may seize the opportunity that the action of the Cambrian men seems to offer of calling a general lock-out.

WEST AFRICA.

The West African Chamber of Mines states that the gold yield of the colony for August was 13,921 ounces, valued at £57,713, a decrease of 1,643 ounces, or £838, compared with the preceding month.

SOUTH AFRICA.

A cablegram from Johannesburg states that during August the mines of the Witwatersrand (that is, excluding outside mines) crushed 1,834,105 tons. The average yield per ton was 28s. 3d., the working costs per ton were 17s. 8d., while the profit per ton was 10s. 6d., and the aggregate profit £961,304. Compared with July, 19,419 tons more were crushed, the daily average tonnage being 59,164 in August, as compared with 58,538 in the previous month.

The Simmer and Jack report for the year ended 30th June shows a profit of £584,700. The shortage of labour during the year necessitated the use of extra drills, and that has been the chief factor in the reduction of the grade of ore, together with the inclusion of ore from poorer stopes hitherto neglected. The total ore reserve estimates are now given as 2,690,000 tons, assaying 6.3 dwts. The filling of old stopes with waste sands is now being carried out, permitting of the recovery of pillars of ore previously left in the mine as supports. This system increases the amount of pay reef extractable and will improve the total profit per claim area.

Developments upon the Modderfontein mine show an aggregate of 2,582,000 tons, averaging 7 dwts., being an increase during the year of 1,000,000 tons and an improvement of 1 dwt. per ton in the value. These figures and facts are unique in the history of mining on the Rand. Further capital expenditure on plant and development will enable the handling of 52,500 tons monthly by January next. The new central vertical shaft is to be built on the circular plan to a depth of 2,000 feet. The consulting engineers estimate that by means of the new shaft 8,250,000 tons of ore can be developed by June, 1913, at a very low cost. The new battery, in course of erection, will increase the crushing capacity by an additional 39,000 tons per month. It is estimated that from June next a dividend of a sovereign per share will be distributed.

SPAIN.

Private telegraphic advices have been received in Glasgow to the effect that the mining strike at Bilbao has been settled through the intervention of the Spanish Government. The men are to resume work. The news created considerable comment both in the iron trade and in shipping circles. The reserve ore stocks of hematite makers are nearing exhaustion, and it is anticipated that there will be considerable pressure to get forward cargoes. It will probably be some months before production on a normal scale can be resumed.

HOLLAND.

The contest between the Standard Oil and the Royal Dutch Petroleum Companies is, according to an Amsterdam dispatch to "L'Information," of Paris, becoming more and more acute. Recently the Royal Dutch Company put down the price of benzine from 16 to 12 cents a litre, but now the Societe des Automates, subsidiary of the Standard Oil Company, of New Jersey, is offering best quality motor essence for 10 cents the litre and is inviting dealers, before concluding contracts, to inquire of them as to details and conditions. The Royal Dutch Petroleum Company is now selling "sumatrine" at 10 cents and "autoline" at 12 cents.

AUSTRIA.

A Vienna dispatch to the "Kolnische Zeitung" announces that the Vacuum Oil Company, which is the Austrian subsidiary of the Standard Oil Company, has in many cases informed its customers that, in consequence of the measures adopted against the company by the authorities, it is unable to carry out the deliveries of benzine in accordance with the existing contracts. The customers, therefore, placed the matter before the Chambers of Commerce, which, in turn, forwarded the complaints to the Government. An order has now been issued by the Government recommending the customers to take legal proceedings, as the Vacuum Oil Company has not suspended working, but has sought, it is declared, under the pretext of "force majeure," to withdraw from its obligations of delivery under unfavourable contracts. It is added, for the rest, that the union of refineries is prepared to accept such contracts.

COMPANY NOTES.

VAN ROI MINING COMPANY, LIMITED

The following statement has been issued by the shareholders of the above company from the London office:

The recent satisfactory developments on the vein parallel to and south of the main lode, now known as the Beryl vein, have decided the board to at once proceed with the erection of the new mill on the Mountain Boomer site. This vein has now been opened up on No. 4 level for a length of 360 feet with the following results:

Average width, 4 feet 2 inches; average assay, silver 16.68 ounces, lead 6.5 per cent, zinc 11.8 per cent.

A drift is also being run on No. 3 level, but has not yet reached the point where it is expected to encounter the ore shoot.

The lease of the Wakefield mill having terminated on the 15th of August, possession was accordingly given up on that date and the work of moving the aerial tram to the Mountain Bloomer end of the mine was commenced. Foundations for the new mill are already completed and the flume work finished. Construction of the mill house will be commenced early this month, as soon as the bunk house to accommodate the men is ready. From the 15th of August all stoping ceased the only work taking place in the mine was the necessary development for preparing the Beryl vein for future stoping. The amount of work necessary is approximately:

240 feet crosscutting on Level No. 5.

80 feet raising from Level No. 5 to Level No. 4.

225 feet raising from Level No. 4 to Level No. 3.

80 feet of drifting on Level No. 3.

Contracts have been let for this work at satisfactory prices.

It is expected that the new mill will be in operation about the beginning of January.

The following cable has been received from the company's managers at Rossland:

Mill report to August 15th: Total amount crushed, 1,226 tons, assaying 12.6 ounces silver, 3.4 per cent. lead, 6.1 per cent. zinc—yielding 65 tons lead concentrates, assaying 141.9 ounces silver, 64.3 per cent. lead, and 9.9 per cent. zinc; and 70 tons zinc concentrates, assaying 41.5 ounces silver, 1.7 per cent. lead and 43.8 per cent. zinc. Total approximate value, $6,925 (£1,428). Mill ran 264 hours.

Estimated expenditure for the month of August: On development, $6,121; on ore production, $1,093; on milling, $1,688; total, $8,902 (£1,835).

Beryl Vein: No. 4 Level—Advanced westwards 35 feet. Raised No. 4 Level to No. 3 Level 51 feet, of which last 30 feet assayed 12 ounces silver, 7⅜ per cent. lead, 14 per cent. zinc, over 2⅝ ft.

No. 3 Level: Advanced westwards 102 feet.

CHAMBERS-FERLAND.

A statement of the Chambers-Ferland Company's affairs, as of August 31st, 1910, shows the assets now represent about $131,000 in cash and bills receivable, and upwards of $70,000 in estimated ore reserves, or nearly the present market valuation of the stock, without taking the property into consideration. The statement is as follows:

Cash on hand	$106,456.19
Bills and accounts receivable	8,458.96
Ore in transit and smelters	16,698.95
Ore on hand	5,621.00
Accounts payable	6,264.56

The ore reserves are estimated at 146,700 ounces.

GRANBY.

At the annual meeting of Granby Consolidated on October 4th, J. B. F. Herreshof, G. W. Wooster, Wm. Hamlin, E. R. Nichols and Northrup Fowler were elected directors to succeed Crawford Clark, jr., J. Langeloth, H. L. Higginson and Payne Whitney resigned.

Mr. Langeloth was president of the company and the largest individual stockholder.

It was voted to request the directors to issue a report every six months on general business conditions and affairs of the company.

BRITISH COLUMBIA COPPER COMPANY.

The British Columbia Copper Company is in good condition, according to late returns. There is in the treasury $250,000, which includes amount due for copper delivered.

The British Columbia Copper Company has ores running high in both gold and silver, particularly the former, from which there is a standard income of $20 an ounce. This ore comes largely from the Jack Pot, the company's new shipper in Wellington camp. This has enabled the company to produce its copper and lay it down in New York ready for sale—notwithstanding the railroad haul across the continent—in the neighbourhood of seven cents a pound, a record which many producers of the continent have not yet attained.

Now that one of the furnaces at the company's reduction works has been enlarged the smelter has increased and will be able to treat about 2,000 tons of ore daily.

The company's August operations resulted in a net revenue of $32,500. These profits compare with $11,918 in July and $7,121 in June. After crediting gold and silver values it cost the company 7.7 cents a pound to produce its copper in August, with only two furnaces in operation.

The production during the previous seven months was as follows:

	Copper (lbs.)	Gold (ozs.)	Silver (ozs.)
January	656,473	2,513	7,530
February	683,234	2,500	7,627
March	891,419	2,623	9,191
April	340,061	125	3,611
May	.....	.....	.....
June	417,040	1,550	5,221
July	574,172	1,960	6,623

STATISTICS AND RETURNS

NOVA SCOTIA STEEL AND COAL.

The statement of the Nova Scotia Steel & Coal Company for September, just issued, shows an output of 55,100 tons of ore, 7,387 tons of coal, 7,220 tons of pig iron, 6,830 tons of steel, while the company shipped 90,000 tons of coal.

COBALT ORE SHIPMENTS.

The ore shipments from Cobalt camp for the week ended October 1st were comparatively large, aggregating 1,387,258 pounds, or 668 tons. Kerr Lake, which made no shipments the previous week or two, heads the list with 420,000 pounds. The total shipments aggregate 47,197,530 pounds, or 23,859 tons.

Shipments for the week and year, in pounds of ore, are:

	Week ended Oct. 1. Ore in lbs.	Year. Ore in lbs.
Beaver	45,600	226,617
Buffalo	60,990	1,783,738
City of Cobalt	66,000	548,875
Chambers-Ferland	.....	1,341,100

Nipissing	187,270	9,342,907
O'Brien	.....	928,416

Peterson Lake		432,320
Provincial		65,000
Right of Way	82,330	1,311,567
Rochester		60,750
Silver Cliff		268,720
Temiskaming	122,400	1,771,480
Trethewey		808,520
Waldman		63,992
Wyandoh		48,300

Following are the shipments from the Cobalt camp for the week ending October 8th, and those from January 1st, 1910, to date:

	Oct. 8. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver		226,217
Buffalo	56,100	1,839,738
City of Cobalt		548,875
Chambers-Ferland	58,800	1,399,900
Cobalt Central		293,286
Cobalt Lake		260,900
Cobalt Townsite	88,000	454,840
Colonial		193,480
Coniagas	138,300	1,502,266
Crown Reserve	58,740	5,117,900
Drummond		664,200
Hargraves		401,170
Hudson Bay		417,925
Kerr Lake	303,280	7,849,994
King Edward		263,406
La Rose	238,530	8,900,531
McKinley-Darargh	108,820	3,053,789
Nipissing	440,780	9,783,687
O'Brien	58,800	987,216
Peterson Lake		432,420
Provincial		65,000
Right of Way		1,331,567
Rochester		60,750
Silver Cliff		268,720
Standard Cobalt		258,951
Temiskaming		1,771,480
Trethewey		808,580
Waldman		63,992
Wyandoh		48,300

Ore shipments for the week ending October 8th were 1,550,150 pounds, or 775 tons.

Total shipments from January 1st to October 8th were 49,269,080 pounds, or 24,634 tons.

PIG IRON PRODUCTION.

According to "The Iron Age," pig iron production in September amounted to 2,054,175 tons, or 68,470 tons a day, an increase of about 50 tons a day over the August rate. Production of all kinds of pig iron is now at the rate of about 24,900,000 tons a year. The United States Steel Corporation has 45 blast furnaces idle and its capacity active is 67.82 per cent., there being practically no change in three weeks. The September bookings in wire products were greater than for any previous September, save one. Specifications and new contracts exceeded those for August. The foundry iron market is uninteresting. Large buying for 1911 is still deferred and the shadow of lower prices for ore in 1911 has now been thrown across the situation.

BRITISH COLUMBIA ORE SHIPMENTS

The Bluebird mine of Rossland and the Hewitt mine of Silverton have both entered this year's shipping list the past week, the former with a shipment of 25 tons, and the latter with a shipment of 22 tons. Both mines have been doing active development work. The Bluebird was a prominent shipper last year, its ore being gold-copper-silver. The Hewitt is in the dry ore belt. The Fern mine makes its second shipment of the year.

The following are the returns of the ore production and movement for the past week, ended October 1st:

Boundary Shipments.

Granby	14,305	871,135

ON TIME

One of the most important business transactions which sensible minded men should perform on time is that of making proper provision for those who are dependent on them for the necessities of life.

The only way to do this is by means of life insurance. The only way to do it on time is to act now while in health. The most satisfactory way is to insure at once in the

Fairbanks-Morse Automatic Ore Dumps

—FOR—

Rapid and Economical Handling of Ore

Your elevating and conveying charges can be reduced — your tonnage output increased—your profits enlarged—by the use of one of our Automatic Ore Dumps.

The Fairbanks-Morse Dump as Illustrated will handle any ore or other similar material Rapidly and Economically It is inexpensive to operate as the one operator at the hoist raises, dumps and lowers the bucket automatically.

They are Operated By Fairbanks-Morse Gasoline Hoisting Engines

All you have to furnish is timber for the frames, all iron work, bolts, nuts etc. are furnished complete. Working drawings furnished.

What We Can Supply For The Mine

Nissen Stamp Mills, complete Crushing and screening Plants, Gates Gyratory Rock and Ore Breakers, Jaw Rock Crushers, Prospector's Outfits, (Portable), Dimmick Classifiers, Rock Drills and Mining Tools, Sinclair Drill Sharpeners, Steam Pumps, Valves, Fittings, etc. Steel Ore Cars.

Ore Shipments

We take personal charge of your shipments to the Atlantic Seaboard, attend to the weighing, sampling, assaying and all other details

We have been successful because we furnish our clients with returns quicker than our competitors.

Consign your shipments to us and rest assured you will get the maximum returns.

International High Speed Steel Co. of New York

CARRY IN STOCK AT COBALT, ONT., WAREHOUSE, all kinds of DRILL STEEL in Octagon and Cruciform.

For price and all information write to our Cobalt office, P. O. Box 370.

Our Steel is made in Sweden from best Swedish Ores and is even in grade.

Want Advt.

Mining Engineer, technical graduate wants position with Coal Co. in Western Canada. Experienced Surveyor, Assayer and Draftsman. Unmarried, age 26. Low initial salary, no objection if chances are good.

Address, Box 653,
Oshawa, Ont.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price,

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE FOLLOWING GEOLOGICAL MAPS HAVE BEEN RECENTLY ISSUED:—

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1025. Waverley Sheet. Scale 1 mile to 1 inch.
1037. Windsor Sheet. Scale 1 mile to 1 inch.

QUEBEC

1079. Geological and Topographical Map of St. Bruno Mountain, Chambly Co., Que. Scale 800 ft. to 1 inch.

ONTARIO

1076. Gowganda Mining Division. Scale 1 mile to 1 inch.
1061. Explored routes in a portion of North Western Ontario, traversed by the National Transcontinental railway between Lake Minnitaki and Lake of the Woods. Scale 4 miles to 1 inch.

ALBERTA

1032. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland. Scale 400 feet to 1 inch.
1004. Geological Sheet, Rossland Mining District. Scale 1200 feet to 1 inch.
1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1105. Map No. 4A. Geological—Golden Zone Mining Camp near Hedley, B.C., by C. Camsell. Scale 600 feet to 1 inch.
1106. Map No. 3A, Geological—Mining Claims on Henry Creek near Hedley, B.C., by C. Camsell. Scale 800 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1041. Geological Map Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of the ore bodies of the same belt.
1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.
973. Catalogue of Canadian Birds, by John Macoun and James M. Macoun.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotland Part I, Economics, Part II Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon and Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
980. Report on a portion of Algoma and Thunder Bay Districts, by W. J. Wilson, and on the region lying north of Lake Superior between the Pie and the Nipigon Rivers, by W. H. Collins. A map showing the geology along the water courses from Lake Superior to the Albany River and from Missinabi to Nipigon River accompanies the report.
1082. Memoir No. 6. Geology of the Haliburton and Bancroft Areas, Ontario, by Frank D. Adams and Alfred E. Barlow.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.

YUKON and NORTH WEST TERRITORIES

1050. Whitehorse Copper Belt, accompanied by maps, by R. G. McConnell.
1097. A Reconnaissance across the McKenzie Mountains on the Pelly, Ross and Gravel Rivers, Yukon and North West Territories, with map, by Joseph Keele.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific. profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Book Dept. CANADIAN MINING JOURNAL, *Confederation Life Building* TORONTO

Geology Applied to Mining

By Josiah Edward Spurr, A.M.

Mining men, prospectors, investors and students have found this book a treasure house. It is a plain, simple, straightforward applicat'on of economic geology to mining problems. It is a concise summary of the principles of ore deposits for the man who wishes to exploit them. It isn't *geology*, but *geology* as *applied to practical mining*. It boils down the abstract science for the practical mining man and student—the processes of deposits, the arrangement of stratified rocks, igneous rocks, structures, placers, chemical geology, etc., etc.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

THOS. & WM. SMITH, LTD.

Westinghouse

Type "H" Oil Circuit Breakers

Made in Two, Three and Four Pole Styles.

Although specially designed for industrial, mining and general motor applications being placed in any position convenient to the motor, they are also adapted to switchboard mountine. Type "H" Breakers can be used on both alternating and direct current circuits, and have a maximum capacity of 100 amperes at 500 volts. Their calibration range is from 80 to 160 per cent. of rated carrying capacity. While automatic in action it can be tripped by hand by means of a small lever on the side of the case.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

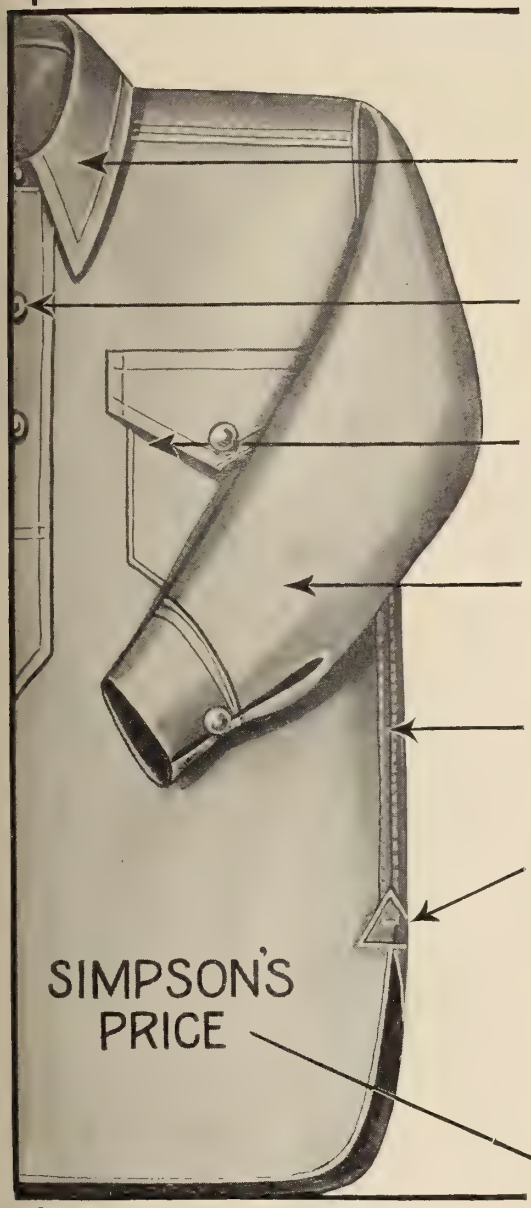
It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It **does not freeze**, or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.



PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

KHAKI DUCK SHIRT

For Miners, Lumbermen, Prospectors, Surveyors

MADE THE SIMPSON WAY

NOTE THE DIFFERENCE FROM THE ORDINARY WAY:—

COLLAR will fit neatly, all ways, all the time. Is well interlined to retain its shape. Steels inserted to prevent curling points.

DOME FASTENERS of brass used throughout. No buttons to come off. No occasion to swear. A feature that will be appreciated by every man.

POCKET Two pockets, one on each side, with dome fastened flap. A splendid idea. Plenty of *pocket space* is a Simpson improvement.

SLEEVES are made large. Plenty of elbow room. Inter-lined wrist-band, dome-fastened. One of the strong points not to be overlooked, viz.—roomy sleeves.

DOUBLE STITCHED seams throughout, with extra strong thread insuring strong wear. This Simpson shirt is made stronger to wear where the most wear comes.

GUSSETS are made strong and double stitched, adding extra strength. You can be absolutely sure the seams will not rip at this point.

FABRIC extra heavy khaki duck. Wind-proof and shower-proof. Will stand the hardest kind of wear. Try it. Almost indestructible.

WHITE JACKET FUSE

Made By Bickford Smith & Co.

Is known as the most reliable fuse the world over.

Don't use inferior brands when you can buy the very best made and not pay more.

White Jacket Fuse stands all tests better than any other fuse:-

24 hours immersion in water.
Rapid changes of climate and temperature.
Burning speed very regular.
Very tough and stands rough handling.

If you have not already used it let us send you samples for a trial.

We carry White Jacket Fuse at all our warehouses and can fill your wants promptly.

"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just becanse it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be the stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we **know**, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs **per year** than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line, As you have everything to gain and nothing to lose, why not investigate NOW?

BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

ROCK DRILL EFFICIENCY

Rock Drill Efficiency is measured by the length of time the drill stays on the job doing good work, standing up to its original capacity without breakage delays.

MATERIALS—The most carefully selected materials are used in the manufacture of **"Rand Drills."** Vital cast parts are made of high-grade open-hearth steel castings and steel parts are made of the finest steel, each selected to perform its particular function in the operation of the machine. Special treatment of steel parts insure the utmost service from each part.

WORKMANSHIP—Rand Drills are built by mechanics who are experts in their line, with years of experience and every facility and incentive for the best work, in a shop equipped with every modern convenience.

We Recommend Our Pumps For Mine Work

¶ They are simple, compact, durable and built with few parts.

¶ Anyone can operate them, they require little room, can stand the heaviest work, will not clog up and are readily over-hauled for cleaning or repairs.

¶ They are built in sizes up to 14″ discharge opening. In Vertical or Horizontal Types, for dry or wet Pit work, and can be operated with any kind of drive—Belt, Motor or Engine.

We will be glad to forward descriptive Bulletin.

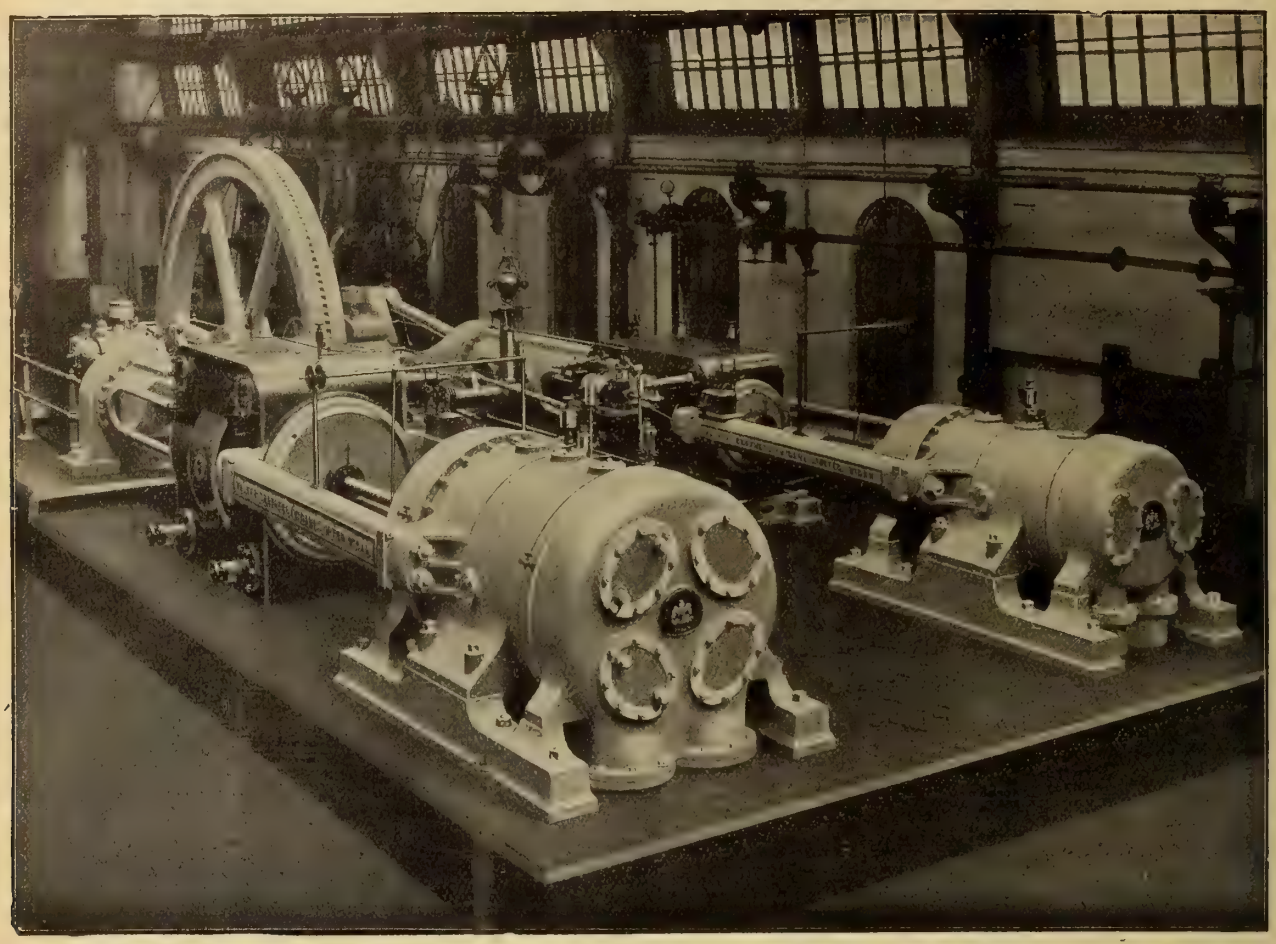
CYANIDE HANDBOOK BY J. E. Clennell

Over 500 pages, 6x9, illustrated, $5.00 (21s) net, postpaid



Mr. Clennell has been in close touch with the rapid developments of cyaniding. He has been instrumental, too, in many important discoveries, and his work in this field has taken him to the leading plants of the world. It deals generally with Cyanide and does not confine itself to the process alone. It is divided into nine main parts covering the subject more fully and exactly than it has heretofore been handled.

Especially noteworthy is the full treatment of recent developments and important phases heretofore *inadequately treated.*

PORCUPINE.

History is being made rapidly in the Porcupine district. Despite bad trails and the utter absence of decent mail service, telephone or telegraph communication, the camp is abundantly vigorous. Owners and prospectors are too busy and too enthusiastic to give more than casual expression to the many grievances that in less strenuous circumstances would be magnified into first-class sores. This is well.

In a previous issue we printed an article on the Porcupine trail, written by Mr. Reginald E. Hore. Already that article is in need of revision, for the Government road, in part bad, in part worse, and in part passable, has been pushed through from Hill's Landing to Golden City. This, along with the establishment of a recorder's office and the careful geological mapping of the region, embraces practically all the attention paid to Porcupine by the Ontario Government. We shall revert later to the question of the Government's duty to the new mining district. Meanwhile let us glance hurriedly at the present condition of the camp.

Porcupine has had a singularly auspicious early history. Large corporations have shown an unequivocal desire to get a strong footing, and several have succeeded. On one property in particular, intelligent and systematic work has been done to determine the character and extent of one section of the ore bodies. Although this work has extended over several months, and although much is now known as to the satisfactory nature of the ore, yet every day adds a little to that knowledge. In other words, every step taken is planned to bear definitely upon the past and the future. At another mine, one that has received a great deal of publicity, work is being conducted vigorously but most unsystematically. Whilst it is now known that the ore bodies here are large, the operators are still very much in the dark as to the distribution of the precious metal. Consequently the tendency to accept insufficient evidence of richness still persists.

On the hundred and one newer properties the chief work done consists in stripping and trenching. On numerous claims only assessment work has been completed. After looking over a few of the typical claims, the observer is amazed at the extraordinarily wide dissemination of gold. Sometimes that gold is visible to the naked eye. Sometimes close inspection will not reveal the tiny yellow specks until the more experienced Porcupiner has pointed them out. The total impression remaining is one of confused conviction that the chances are well worth taking.

There is no lack, of course, of absolutely worthless ground. There never is. But in Porcupine there is abundance and to spare of territory that can be de-

scribed as ranging all the way from moderately attractive to irresistably seductive. And when we find mining engineers from all parts of Europe and America spying out the land, it can be taken as indicating that there the game is worth the candle.

As of all new camps, it is true of Porcupine, that there are no fixed standards whereby to evaluate prospects and properties.

Prices are in the main exorbitantly high, and prices will remain high as long as the demand lasts. This is human nature and from one point of view may be good business. But the custom of refusing to consider workable terms is decidedly detrimental to the whole camp. Reasonable terms of payment are essential—more essential indeed than the magnitude of the total purchase price. Except in odd cases we have heard no fair terms discussed or offered by owners.

In an article elsewhere in this issue Mr. R. E. Hore discusses the form and character of the lodes, veins, and vein systems of Porcupine. His article is a clear exposition of our present knowledge of the subject. Much yet remains to be learned. Probably it will become more and more clear that Porcupine gold veins differ only incidentally from other Canadian deposits. We hope that in the one essential they will stand in a class by themselves.

It is a truism to state that Porcupine is not yet a proven camp. Naturally it cannot be and will not be for many moons yet. On the other hand, nothing has yet been adduced to discourage the investor. And that is saying a good deal.

Of Porcupine's needs volumes could be written. Nature will provide for one of the most pressing. The advent of winter will solve transportation problems for a time, and will render possible the moving in of machinery and other heavy freight. Temporary as this relief will be, it is hard to overestimate the meaning of this. One must have seen for himself the quagmires, the ruts, the liquid mud, the paralyzing corduroy of Porcupine trails, before he can realize what the mine operators have to contend with. Incidentally, it is surprising to notice the lack of co-operation between mines in the matter of good roads.

The lack of telephone and telegraph lines is a costly gap in the organization of Porcupine. Precious hours and days are lost. Loss also is daily incurred through an unspeakably bad mail service.

Now we shall not discuss the point as to what may or may not be the moral obligations of the Ontario Government towards Porcupine. It will serve our object better to review matters from the commercial side, a side that is not without its appeal to most of us. For the first time on record there is developing in Ontario a gold mining camp that is the cynosure of mining men of both hemispheres. It is situated in a part of the Province that must soon be opened up in any case. It is in no need of booming, but it very decidedly does need a fair proportion of assistance. In all probability Porcupine will soon have netted the Provincial Treasury about $75,000 in revenue from miners' licenses, transfer and recording fees, etc. This is a direct gain. But indirectly Porcupine has brought and will bring many hundreds of thousands of dollars into the Province. At least two or three thousand persons will find employment there this winter. The Government railroad will be taxed to its utmost capacity to carry the quantities of freight that will be shipped in. In these and in other ways Porcupine will be profitable to Ontario. And this will be the case whether the life of the camp is three or thirty years. As with Cobalt, so with Porcupine, as regards agriculture. The farmer will follow the miner just as soon as economic conditions become normal.

It seems, therefore, that for reasons of business expediency alone, it is shortsighted for Ontario to withhold her instant support. A railway charter for a branch line from a point on the T. and N. O. has been granted; but we believe that no serious effort is being made to enforce the chief condition of that charter, which implies speedy construction. We would suggest that every day lost deprives the Province of a large and sure income. Because of some complications with the Canadian Pacific Telegraph Company, the erection of a telegraph line has not been proceeded with. This entails loss and hardship upon Porcupine itself, and upon interested outsiders. These instances in themselves indicate a departure from the policy that built up the country north of Cobalt.

The attitude of the mining public towards Porcupine warrants the Ontario Government in giving prompt consideration to requests for assistance. In giving that assistance the financial risks assumed will be relatively nothing. The returns to the Government throughout the period of construction and installation will be enormously in excess of any appropriations that it is likely to make.

The men who are putting their money into Porcupine are in earnest. They are taking all the chances, and they are glad to take them. They ask for fair treatment, especially in respect to public utilities. Rather than delay their plans they are willing to construct a railway and erect telegraph lines themselves. We believe that the Government can do both without laying itself open to the charge of rashness. Neither the operators nor the Government can see far into the future. But both can justify present expenditure by present prospects.

THIRD ANNUAL REPORT OF LA ROSE CONSOLIDATED.

We are inclined to agree with the statement made by Mr. D. Lorne McGibbon in his prefatory remarks, to the effect that the position of La Rose Consolidated has been strengthened during the past fiscal year. The net profits have increased from $1,320,147.82 to $1,472,005.03. This is especially gratifying in view of the fact

that the cost per ounce of producing silver during 1909 was only 61.31 cents per ounce, whereas the cost per ounce recorded in 1910 is 23.27 cents per ounce. A contributory factor in the larger net profits was the higher average selling price of silver. During 1909 the average for the fiscal year was 51 cents, while the average price for the period covered by the report under consideration was 52.261, a difference of 1.261 cents per ounce, aggregating a gross advance of $39,974.05. This figure, however, is incidental. A truer basis of comparison is afforded by the total expenditure on production. In 1909 this expenditure amounted to $475,562.53. During 1910, the sum of $737,842.37 was expended. Of this latter amount, $152,403.38 was spent in trenching and general development. Whilst the tonnage shipped during the year ended May 31st, 1910, was slightly greater than that shipped during the preceding period, the average silver content was also higher. The averages stand respectively 480.8 ounces per ton for 1909, and 491.05 ounces per ton for 1910. These averages are affected principally by the larger tonnage of ore concentrated—649.79 tons as compared with 31.62 tons—during 1910. The average silver contents of high grade, low grade, and concentrated ores are, respectively, 1181.98 ounces, 133.84 ounces, and 649.79 ounces.

As the third annual report is more completely itemized than is the previous report, it is possible to follow the distribution of expenditure. The largest item in mine operation is "development and exploration," which amounts to $144,223.21. "Stoping" comes next with $71,906.11. The charge for mine operation per ounce of silver mined was only 0.089 cent in 1909, whilst in 1910 it ran up to 0.1414 cent, an increase due almost wholly to development. In other charges there are only relatively slight changes.

During 1909 the total footage of drifting, raising, crosscutting, and sinking was 6,303 feet. The corresponding figures for 1910 are 10,059 feet. But in stoping and trenching the difference is most marked. The figures for 1910 are 18,789 cubic yards, as against 7,477 cubic yards for the previous year, and 5.16 miles of trenching as compared with 12,145 feet.

The Lawson mine enters as a producer for the first time, being credited with 173,730 ounces.

The Princess produced 113,146 ounces, whilst the output of the University is negligible, and the Fisher-Eplett does not appear at all.

Concentration as carried on by contract at the plant of the Northern Customs Concentrator, Limited, appears to be eminently satisfactory. An extraction of 79.12 per cent. is reported on ore carrying 28.58 ounces.

Ore reserves have been maintained. Their total silver content is 5,544,000 ounces, as compared with 4,968,418 ounces estimated one year before. However, the great bulk of this year's reserve is mill rock. Of the total reported reserves, 65,849.7 tons, only 2,876.7 tons is high grade. Close comparison with the previous year is not practicable, for the reason that only one classification of ore in the mine is now adopted, namely "Developed and Partly Developed." In the former report, reserves were thrown into two categories, "Partly Developed Ore," and "Indicated Ore." We take it that General Manager R. B. Watson's present classification is less speculative than was that formerly used.

Whilst the general manager is to be congratulated upon the really excellent showing that he has made, it is a matter of regret that the annual report of so important a concern as La Rose Consolidated should not be more ample. Plans of the workings should be shown. Assay maps would throw much light upon points that are now necessarily obscure. We would suggest, therefore, that in future the annual report of this corporation be fittingly illustrated and greatly amplified.

MINING OPPORTUNITIES IN CANADA.

The new fields of Northern Ontario and Northern British Columbia are so much in the public eye that other districts are overlooked. In fact, the foreign investor is prone to imagine that Cobalt, Porcupine, and Portland Canal offer the only sound chances for venture. This, of course, is far from the truth.

In an editorial that appeared in The Canadian Mining Journal, January 15, 1910, we alluded to a few of the sound ventures and investments that are open in unadvertised regions of the Dominion. The time is ripe to draw attention once again to these overlooked districts.

The full benefit of keen foreign interest in new fields cannot be felt if that interest is permitted to centre exclusively in one camp. Any one camp, no matter how meritorious it may be, is bound to bring disappointment and failure to many. The irrevocable law of averages holds in prospecting and in mining as in everything else. Hence it is unwise to place all of one's eggs in one basket. Furthermore, there has never been a better time for impressing upon the representatives of capital the desirability of investigating the merits of mineral deposits and mines in other parts of Canada. Any newly discovered bonanza should be merely a point from which increasing waves of activity radiate.

Advices are constantly reaching us of the revival of mining in places that have long lain dormant. For instance, the placer gold of Eastern Quebec, the gold-antimony ore of Nova Scotia, the iron deposits of Eastern Ontario, the gold mines of Lake of the Woods, and many almost forgotten metalliferous mines in southern British Columbia, are all receiving active attention. This is particularly true of Nova Scotian gold mines and of various non-metallic mineral deposits throughout Eastern Canada.

It is appropriate to point out here that in some respects British Columbia and Nova Scotia are still preeminently our mining provinces. In both mining has long been a leading industry. The development of transportation facilities has been influenced, therefore, very largely by the requirements and growth of mining.

The movement of large quantities of such commodities as iron ore, coal, and gypsum demands traffic organization that is adequate and expansible. It is unfortunate that in Quebec, Ontario, and Alberta the railways are yet far behind the pressing needs of the industry. Hence the two previously mentioned Provinces afford in many instances better industrial surroundings than do the others. Time, of course, will bring improvements all over the Dominion.

But, harking back to our original theme, there are specific localities where foreign capital can seek investment with strong chances of success, chances heightened by an improving market for Canadian mineral products. The molybdenite and graphite deposits of western and northern Quebec require investigation. Much of the unexploited coal area of Nova Scotia is entirely worth while. The building and decorative stones that are found so frequently in the older geological horizons have as yet been practically neglected. Such minerals as gypsum, barite, infusorial earth, paint ores, and so on, await commercial development. In all these there is money to be made, provided always that the investor employs men who know their business and are thoroughly familiar with working conditions.

Another legitimate channel of investment lies in the careful selection and equally careful consolidation of mines now abandoned. This, naturally, is treading upon very delicate ground. But the life history of the average mining camp, more especially of camps that have been opened with a boom, points to the conclusion that the steadiest profits may be expected long after the period of bonanzas is past. Cases could be cited here that would astonish readers who are not conversant with the mining history of Canada. But it is not well to be too specific. Suffice it to say that consistent study of Provincial and Federal reports is one of the best possible guides. Above all it is desirable that the foreign investor be advised by a mining engineer practising in Canada. Not only are initial mistakes avoided, but energy, time, and money are saved by employing a professional man who knows the customs, laws, and red tape of the Dominion. And in dealing with lands controlled by the Federal authorities it is absolutely necessary to possess a first-hand knowledge of red tape—not infrequently adhesive.

To the foreign mining investor who is in earnest, who knows what he wants, and who is capable of taking ordinary pains to be sure that he gets it, Canada is a land rich in possibilities.

STANDARD ENGLISH.

"Mines and Minerals" for September contains an editorial on "Standard English," which is mainly a plea for the use of plain English in mining literature, and the avoidance of localisms. Most persons will thoroughly agree with such a plea, but the writer goes a little further. He states that so far the people in the United States have "spoken better English with fewer dialects than the inhabitants of the British Isles," and there is not any reason why Americans should adopt old English localisms "that originated in fun or ignorance." The writer then goes on to explain the origin of "inbye" and "outbye," as follows:—

"The former had its inception from some old miner who remarked 'are you going in, bye?' instead of 'are you going in the mine, boy?' and 'outbye' followed naturally."

This explanation must have originated either "in fun or ignorance," for it is utterly fantastic. The words "inbye" and "outbye" have been used in Scotland and the north of England for generations beyond memory, and it may be suggested, with due deference to the boasted freedom of the American nation from dialect, that the pronunciation of "boy" as "bye" smacks more of Pennsylvania than of either Durham or Fifeshire. There are many English localisms that should not be introduced into American mining literature, but the writer in "Mines and Minerals" is unfortunate in picking out for attack such convenient and useful expressions as "inbye" and "outbye." It is a fair challenge to ask what he would substitute for them. The phrases "up track" and "down track" have their significance on railways, the words "indoor" and "outdoor" are good English not liable to be misunderstood, and "inbye" and "outbye" are legitimate words sanctioned by long usage. The idea they convey cannot be otherwise conveyed but by the use of a phrase containing at least half a dozen words, and even then there is a risk of ambiguity. The writer of the "Mines and Minerals" editorial has evidently had little experience in English coal mines or with English miners, else he would not have used the word "boy" in his very ingenious explanation; the English miner says—"lad." It is more charitable, however, to assume that the account of the origin of "inbye" and "outbye" is intended as a solemn joke.

EDITORIAL NOTES.

Analyses of iron ore from Arisaig, Antigonish County, Nova Scotia, as reported by the Mines Branch, Ottawa, range from very low iron contents up to 53 per cent. Sulphur is uniformly low. Phosphorus ranges from 0.5 per cent. to 1.20 per cent., whilst lime is usually in the neighbourhood of 2 per cent.

A special committee of the British Home Office is considering amendments to rules governing the installation and use of electricity in coal mines. The rules under revision were formulated in 1903 and are adapted rather to the alternating-current system of power transmission than to the continuous-current system.

The silica content of finely divided sulphide concentrate can very seldom be reduced to less than 20 per cent. without disproportionate loss.

During the calendar year 1908, the quantity of silver issued for use in the industrial arts throughout the United States amounted to 23,775,422 ounces.

PORCUPINE GOLD DEPOSITS

(Written for the Canadian Mining Journal by Reginald E. Hore, Houghton, Mich.)

The gold at Porcupine occurs chiefly in pyritic quartz. In lesser amounts it is found in the country rocks.

The quartz in most cases is white in colour, with reddish-brown patches of iron oxides. Less commonly, but including some spectacular veins, the colour is greyish-blue.

The gold is, in part, coarse and readily visible to the naked eye. In most of the quartz, however, it is very fine. The greater part, 50 to 65 per cent. is readily won on crushing. A smaller percentage is more intimately allied with sulphides and will probably be treated by cyanidation.

The country rock is usually either pyritic grey schist or rusty-weathering mixed carbonates. Less often it is a conglomerate.

Quartz Ferrodolomite Lode—Foster Claims. Quartz Veinlets In Ferrodolomite.

The schistose country rocks are for the most part altered volcanics, and are of various types. Many are sericitic and all are impregnated with carbonates. Small cubes of pyrite are usually abundant. Copper pyrite occurs; but in very subordinate quantity.

The carbonate rocks are grey to yellowish-grey, crystalline and massive. They are iron—calcium—magnesium carbonates, such as are common in the iron formations of Ontario and the Lake Superior states. Such rocks range in composition from siderite through ankerite to dolomite, and on the iron ranges are called ferrodolomite. The percentage of iron in the Porcupine rocks, as in most Keewatin carbonates, is less than in normal ankerite.

The conglomerate is composed of light-coloured pebbles of various types set in a fine grey coloured matrix. An arrangement of the pebbles with their longer dimensions parallel, gives a decided schistose appearance.

Form of the Deposits.

The deposits vary greatly in shape. Some appear at the surface to be well defined single fissure fillings or veins. In some cases there is a series of fissure fillings running nearly parallel and enclosing large and small masses of rock. These are conveniently referred to as vein systems. In another type numerous quartz veins run through ferrodolomite beds. We may designate these as ferrodolomite lodes. There are also large quartz masses of irregular and unknown form, which cannot be well designated as veins or lodes. They appear to be lenticular rather than tabular in shape. From the nature of outcropping surfaces, they have been called "domes." Until their true character is known, it seems best to refer to them as quartz masses.

These four types may be illustrated by description of four claims in Tisdale Township. For a single quartz vein we may take one on the Connell property. A system of quartz veins is exposed at the Timmins mine. The most striking example of quartz ferrodolomite lode is the Foster. A remarkably large quartz mass or "dome" is that at the Dome mine. None of these deposits has been thoroughly explored, and observations on their nature must therefore be confined almost entirely to superficial characters. The Dome is being tested by drifts and cross-cuts at the 60-foot level, and by diamond drilling to a few hundred feet. One of the veins at the Timmins is being drifted on at the 100-foot level. The Foster lode and the Connell vein have each

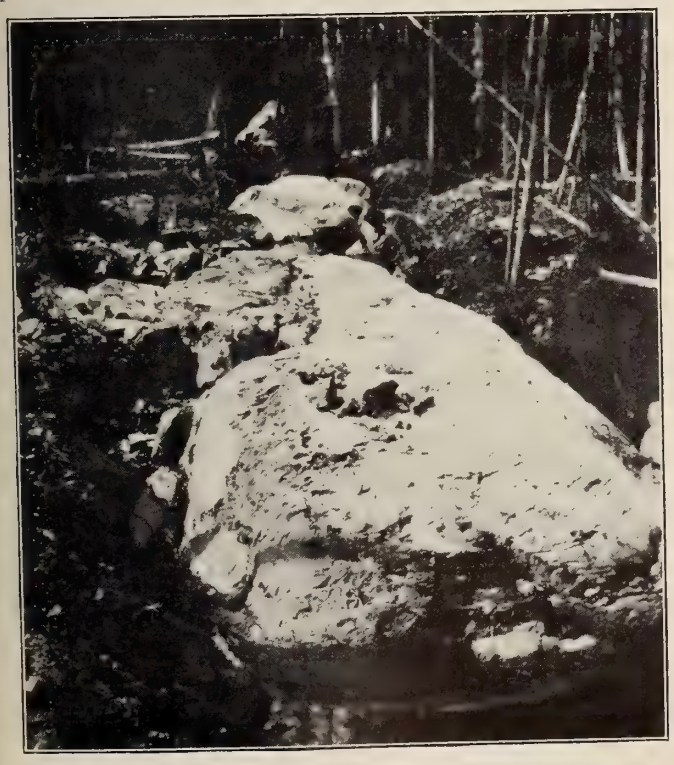
been carefully stripped; but neither has yet been tested for more than a few feet in depth.

Quartz Vein.

The deposit selected as an example of this type is located on the Connell claims, just south of the centre of Tisdale Township. The vein has been exposed almost continuously for over 200 feet. At the western exposure it is 15 inches and at the eastern, where it dips into low ground, 5 feet wide.

The quartz is milky-white and vitreous. Where it has been directly exposed to the weather, it is coated with yellowish-brown iron oxides. Streaks and patches of this secondary material are found filling small cavities and crevices for a few feet downwards. Portions of the vein which were protected by a mantle of soil, show similar alteration, but to a much less degree. Some such portions show scarcely any weathering and appear brilliantly white in the sunlight.

Quartz Ferrodolomite Lode—Foster Claims. White Bands of Quartz Stand Out. In Relief from Rusty Ferrodolomite.

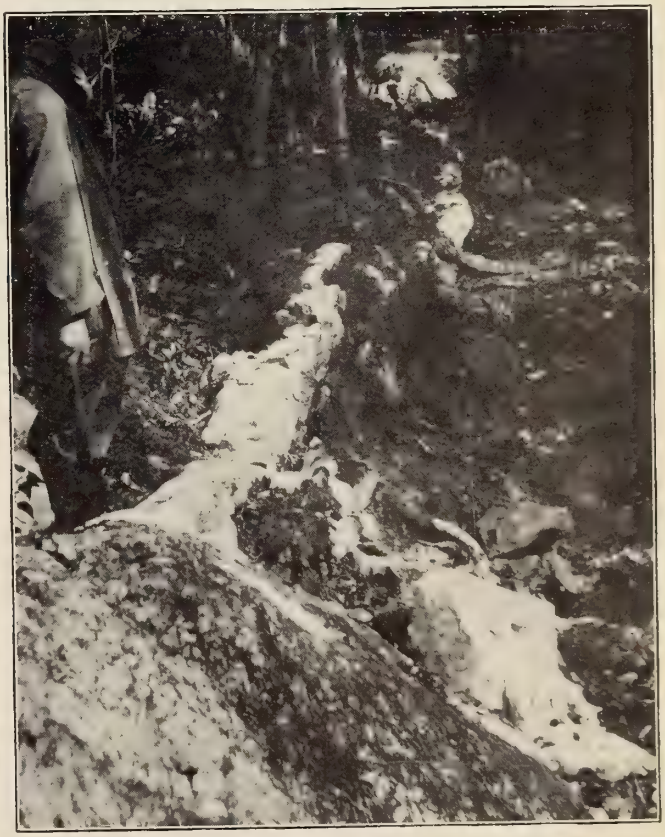


Free gold can be seen for several feet along the vein. It is coarse and readily detected by the naked eye. The most spectacular and richest portion is a streak about 15 inches wide on the north side of the vein. Here countless particles of coarse gold appear on the surface. It occurs especially in rusty cavities and in minute dark streaks, which fill crevices in the quartz. The gold particles are even more numerous, however, on the vein

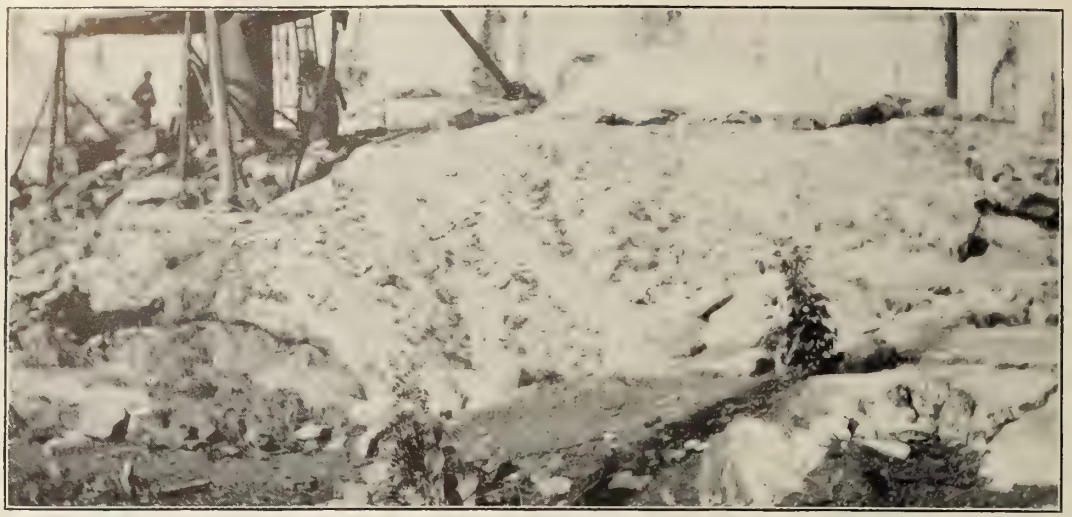
Quartz Vein, Connell Claim. Showing Well Defined North Wall.

wall. This wall is very clean cut, and has but a thin selvage of dark greenish colour. It is slickensided and shows pronounced grooves running nearly vertical. These grooves, running normal to the undulatory strike, produce a decidedly corrugated surface, as may be seen in the accompanying photograph.

The wall rock is a rusty weathering ferrodolomite. At the immediate contact it is disintegrated for a foot in depth. A foot or more from the contact it is quite massive, except for a few inches at the surface. The fresh rock is of light grey colour, finely crystalline and soft. It effervesces slowly with dilute acid. Scattered through it are striated cubes of pyrite. Veinlets of white quartz penetrate in all directions.



Quartz Vein, Connell Claim.



The carbonate on the north wall is only a few feet wide, and is succeeded by dark-coloured, fine-grained porphyritic igneous rocks. South of the vein the rocks are not exposed.

Quartz Vein System.

At the Timmins mine there are a number of large quartz veins striking in a northeasterly direction. Some of them are but a short distance apart and appear to converge and enclose large masses of rock. Others running parallel, and supposedly of the same vein system,

Quartz Vein, Connell Claim. Looking East along Strike showing Vein for 200 feet.

Quartz Mass, Dome Mine. All Quartz except at lower left corner.

Quartz Veins, in Grey Schists, Timmins Mine. This illustrates, in miniature a Vein System.

Quartz Mass, Dome Mine. Showing nature of Contact.

are 200 feet and 400 feet apart. The larger members of the system themselves enclose numerous fragments of schist similar to the country rock. This vein system appears to be part of a larger veined zone, which extends northeast to and north of Pearl Lake.

The quartz is in most of the veins white in colour, except where stained brown with iron oxides. An exception is a vein of greyish-blue colour, which cuts across one of white quartz. The veins are commonly 4 feet to 10 feet wide, and one vein, now being developed from two shafts 250 paces apart, is 8 feet to 15 feet wide.

Quartz Mass, Dome Mine

There are a large number of veins which show free gold on the surface, generally in rusty patches or in minute fractures. The ore from a few feet below the surface is remarkably free from iron stains, and the pyrite crystals have scarcely any tarnish. Ore impregnated with par-

Quartz Vein, Connell Claim. Rich Streak containing coarse gold in centre.

Dome Mine. Shows Veins in Schists near Large Quartz Mass.

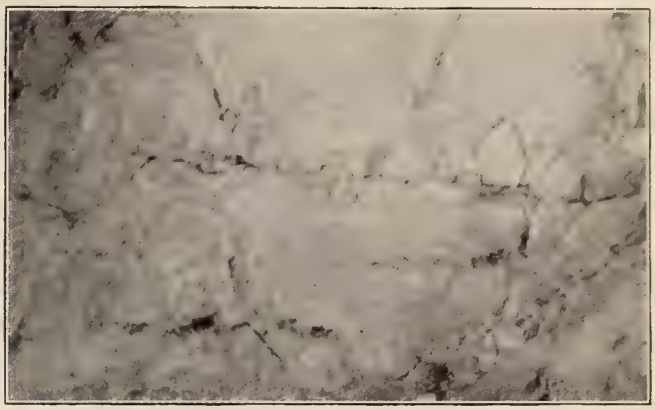
ticles of coarse gold has been taken from a drift at the 100-foot level, and it is more spectacular than any of the surface showings. The workings are in ore at almost all points, and the ore is high grade.

The wall rock is a grey pyritic sericite schist impregnated with carbonates. The pyrite occurs both as small cubes scattered through the rock, and in less perfect crystals in little veinlets. Mr. C. W. Knight has suggested that the schist is an altered phase of quartz porphyry, which occurs in the vicinity. It is similar to, but not so siliceous as, some of the sericite schists at Temagami, which Dr. Barlow showed to be mashed quartz porphyry.

It is as yet impossible to trace out the individual members of the vein system. Many of the outcrops are small and separated by low ground. The strike of veins on neighbouring outcrops is frequently too divergent to permit the interpolation. Considerable stripping has been done and a few veins traced continuously for several hundred feet.

A remarkable outcrop is the greyish-white quartz "dome" beside which No. 1 shaft has been sunk. For the greater part it shows, as may be seen from one of the accompanying photos, a marked similarity to some marbles. In places it is stained with iron oxides, and in such rusty patches are many particles of coarse gold. The exact relation of this mass to the vein in the shaft is not evident. From the far side of the shaft house, a vein 3 feet wide, runs northeast for a few paces along the edge of the stock pile, and then is lost in low ground.

Timmins Mine, Nodular Quartz Masses in Crumpled Grey Schist.



Timmins Mine, White Quartz in Grey Schists.

Several hundred feet along the strike another outcrop shows similar quartz. Southwest from No. 1 shaft there are fairly continuous outcrops of quartz, which are probably parts of one vein, and which have been tested

Timmins Mine, one of the larger Veins, showing decided Tabular Shape.

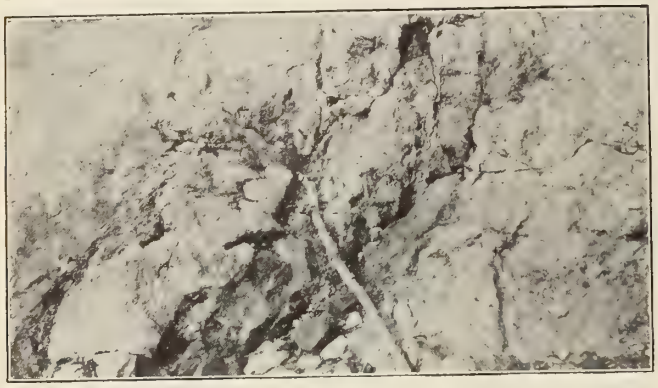
Timmins Mine. Face of White Quartz Mass at No. 1 Shaft.

by two shafts. From the further shaft a drift is being made at the 100-foot level towards No. 1.

In some outcrops east of No. 1 shaft, a variety of structure is shown by quartz veins in the schists. In some places the veins cut distinctly across the foliation of the country rock. In others there are veins of similar quartz, which conform closely to the schistosity and terminate abruptly in the sharp folds.

Quartz-ferrodolomite Lode.

On the Foster claims gold occurs in quartz veins which run through a band of rusty weathering ferrodolomite. The largest lode has been stripped for about 250 paces. It shows a width of 5 feet to 20 feet, and for a considerable proportion of its length, averages over 10 feet.



The quartz stands out in relief from the more deeply weathered, red brown, oxidized ferrodolomite. Several quartz bands, 4 inches to 10 inches wide, run normal to the strike of the lode, and the carbonate is impreg-

Timmins Mine, showing Quartz Vein in Grey Schists. Stockpile at Left.

nated with a multitude of very small quartz veins. Many of the latter occur in two sets which divide the carbonate into small rectangular blocks.

The quartz is white in colour, but stained with iron oxides. The red rust comes partly from the oxidation of small pyrite crystals, which are abundant in patches of the quartz, and in part from the weathering of the ferrodolomite. In some of the rusty crevices there are spectacular showings of coarse gold.

Timmins Mine, showing Rusty Spots where Coarse Gold is found in Quartz Mass.

The lode strikes nearly due west. The country rock is a pyritic grey schist impregnated with carbonates.

Quartz Masses.

At the Dome mine a smooth hummocky outcrop glistens white in the sunlight. It is chiefly made up of huge masses of quartz which enclose large and small fragments of grey schist. The country rocks are grey sericite schist, grey slate and a schistose conglomerate.

One mass, which is almost entirely quartz, has a surface area 100 feet by 200 feet, and there are numerous smaller masses of elliptical plan. An oval-shaped area, including much country rock, but of which about one-half is quartz, is 600 feet by 200 feet. In addition to the large masses, there are numerous veins one foot to three feet in width, which penetrate the country rock. Some of these are almost conformable with the schistosity, but many cut distinctly across it.

The dome-shaped masses show rather varied relations to the enclosing rock. In some cases the contact is nearly vertical, while in others it is but gently inclined. The

Timmins Mine, showing Contact of Quartz with Grey Schists.

boundaries are seldom nearly straight lines, but elliptical or circular.

Coarse gold shows at several places on the surface. It, together with pyrite, is especially abundant in the vicinity of enclosed schist or the country rock. A large tonnage of quartz carries workable quantities of fine gold. The pyritic schist itself is known to carry some gold values. Small striated cubes of pyrite are abundant in both the schist and the quartz. Copper pyrites also occurs, but is probably not in such quantity as to interfere seriously with the recovery process.

ANNUAL REPORT OF DEPARTMENT OF PUBLIC WORKS OF THE PROVINCE OF ALBERTA, COAL MINE BRANCH

That the coal mining industry in the province is steadily expanding may be seen from the following comparison of outputs for the last few years. The year 1909 shows a considerable increase in output over 1908, and doubtless this increase would have been still greater had it not been for a dispute between the operators and their workmen during the early part of the year, which had the effect of closing down most of the large mines in the southern part of the province for about three months and shutting off approximately 75 per cent. of the total coal production of the province during the period of inoperation.

Year.	Output in tons for N.W.T. (Alberta and Saskatchewan)	Output in tons Alberta.
1901	346,648	.....
1902	510,674	.....
1903	622,939	.....
1904	782,931	.....
1905	.....	811,228
1906	.....	1,385,000
1907	.....	1,834,745
1908	.....	1,845,000
1909	.....	2,174,329

The above figures show that there has been an increase of 17.85 per cent. over the 1908 output.

Classification of Output of Coal in Alberta During the Year 1909.

	No. of tons.
Lignite coal	763,673
Bituminous coal	1,197,399
Anthracite coal	213,257
Coal used in coke production	148,104
Coke produced	87,812
Briquettes produced	89,785

Summary of Statistics.

Number of mines at present in operation	121
Number of new mines opened in 1909	32
Number of mines abandoned in 1909	8
Number of tons of coal mined	2,174,329
Number of tons of coke produced	87,812
Number of tons of briquettes produced	89,785
Average number of persons employed inside the mines	3,893
Average number of persons employed outside the mines	1,314
Number of fatal accidents inside the mines	7
Number of fatal accidents outside the mines	2

Number of non-fatal accidents inside the mines	47
Number of non-fatal accidents outside the mines	13
Number of mine manager certificates issued	27
Number of pit boss certificates issued	23
Number of fire boss certificates issued	44

Summary of Inspector's Report.

Edmonton, January 15th, 1910.

John Stocks, Esq.,
Deputy Minister of Public Works,
Edmonton, Alta.

Sir,—As Provincial Inspector of Mines, I have the honour to submit herewith my annual report for the year ending December 31st, 1909.

The development work in connection with the coal mining industry throughout the province has been very active during the past year and several important mines have been added to the list.

At Taber a number of the small companies have consolidated and three larger and more substantial companies formed, viz.: The Great Western Coal Company, The Alberta Consolidated Coal Company, Limited, and The Rock Springs Sootless Coal Company, Limited. All three of these companies have installed good sized plants, including complete compressed air plants and coal-mining machines, and two of them have already procured railway facilities.

In the Lethbridge district the Diamond Coal Company, Limited, have completed the installation of their plant, put in a spur line of railway and are now in a position to push the development of their mine ahead, which will put them in a position to produce a much larger output during the coming year. The Royal Collieries, Limited, are pushing the development of their mine ahead rapidly and are getting it into shape for a much larger output. The new plant of the Alberta Railway & Irrigation Company, at their No. 6 mine, has been completed, and the development of the mine is being carried out on a large scale.

In the Crow's Nest Pass the Leitch Collieries, Limited, have opened a new mine, erected a tipple and obtain-

Surface Plant No. 2 Mine, H. W. McNeill Co., Ltd., at Canmore.

ed railway connections. At Burmis there is another mine opened by the Davenport Coal Company, who have procured railway connections. At Blairmore a new mine has been opened by the West Canadian Collieries, Limited, which should develop into a large mine. West of Coleman the McGillivray Creek Coal & Coke Company, Limited, a new company which has been formed, has opened a mine on a 12-foot seam of coal and a new tipple and plant are in course of erection.

In the Pincher Creek district the Western Coal & Coke Company, Limited, have had a gang of about thirty men prospecting the coal seams on their property during the last few months, and are now opening permanent tunnels.

West of Edmonton, along the Grand Trunk Pacific Railway, a number of companies which have recently organized have secured extensive properties and have done considerable work in proving the coal seams. At least two of these companies have ordered machinery and are making preparations to develop their mines, and I understand will have railway connections during 1910, which will place them in a position to produce a

Surface Plant Nos. 5 and 6 Mines. Alberta Railway and Irrigation Company Lethbridge.

fair amount of coal by the end of the year.

Following you will find a summary of the development work in the various districts during the past year:

International Coal & Coke Company, Limited, Coleman.

Additions have been made to the machine and carpenter shops and the following tools installed: Two new lathes, hack saw, steam hammer, band saw, pipe cutter and threader. The boiler house has been extended and two 100 h.p. Leonard return tubular boilers installed, bringing the total boiler capacity up to 1,250 h.p. Two condensers have also been installed. Two additional compressed air locomotives of 19,500 pounds weight have been put into use, making a total of eight compressed air locomotives in use at the mine. The company's snow sheds have been extended. A 10-inch water supply pipe has been laid to the plant and a 500-gallon fire pump installed. The track in the mine has been relaid with 45-pound steel. A considerable amount of rock tunnelling has been done and preparations are being made to work the coal to the dip of the present gangway.

Bankhead Mines, Limited, Bankhead, Alta.

A hoisting engine has been installed at the head of slope in No. 4 seam. A rock tunnel has been driven from the slope workings in No. 4 seam to No. 5 seam and is now being extended to intercept No. 6 seam. The use of explosives for blasting coal has been discontinued, excepting in the No. 6 seam, in which Monobel powder is used. This has greatly added to the safety of the mine and has also increased the percentage of lump coal produced.

Hillcrest Coal & Coke Company, Limited, Hillcrest Mines, Alta.

A wash house with concrete floor and walls has been erected, and snow sheds have been extended. Monobel powder has been introduced into the mine and is now used exclusively for blasting the coal, which adds greatly to the safety of the mine.

The H. W. McNeill Company, Limited, Canmore.

The following machinery has been installed:

No. 1 mine, above ground—One 18-foot x 66-inch 125 h.p. tubular boiler. One exhaust steam Hoppes feed water heater with boiler feed pump. One first motion 22-inch x 36-inch hoisting engine for hauling coal from main slope. The wash house has been enlarged and has now a total of 250 lockers.

No. 1 mine, below ground—One 6-inch x 10-inch 7-ton compressed air locomotive. The main air courses have been improved and enlarged. A rock tunnel has been driven from No. 3 seam to No. 1 seam across a fold, a distance of 200 feet, and has reduced the length of the main haulage road about 1,500 feet.

No. 2 mine, above ground—A tipple and screening plant with a capacity of 100 tons per hour has been completed and is now in operation. The wash house has been extended and is now fitted up with 140 lockers and hot and cold water shower baths.

No. 2 mine, below ground—The main air courses and travelling roads have been enlarged and improved.

The fire bosses at Nos. 1 and 2 mines have been provided with safety lamps of the Wolf pattern. All lamps which were fitted with the screw lock are now fitted with the lead plug lock, which adds considerably to the safety of the mine.

Canadian Coal Consolidated, Limited, Frank. (Successors to Canadian-American Coal & Coke Company, Limited.)

Old Mine:—Preparations are being made to recommence the working of the slope. The main gangway has been improved and enlarged. Safety lamps are used in all places above the level of the main gangway. The use of dynamite has been discontinued and Monobel powder is used for blasting the coal, shots being fired Bickford-Smith igniters. The fire bosses have all been provided with safety lamps of the Wolf pattern, and the Clanny lamps which are now used by the workmen are gradually being replaced by the Wolf lamp.

Shaft Mine:—The following additions have been made to the surface plant: A new bankhead has been erected; two Stirling water tube boilers, 225 h.p. each; one low pressure Ingersoll air compressor for operating rock drills; and a saw mill with a capacity of 25,000 feet per day have been installed. Foundations have been laid for four Babcock & Wilcox boilers of 250 h.p. each. A power house is being built to accommodate a 500 k.w. electric generator, exciter, switchboard and necessary fittings, which are now on order. A ventilating fan has been placed at the mine and the development of the underground working is being pushed ahead.

West Canadian Collieries, Limited, Blairmore.

A steel tipple fitted with the Green dump with a capacity of 1,500 tons per day is being erected by the Bartlett Snow Company, and one high pressure compressed air plant, one eight-ton and two five-ton compressed air locomotives have been installed. The present mine track is being relaid with 40-pound steel. One 78-inch Sirocco fan, capable of giving 100,000 cubic feet of air per minute with a two-inch water gauge and one 150 k.w. electric generator for lighting purposes, driving fan, tipple, etc., have been put in. The power house is being built of masonry. A considerable amount of diamond drilling is being done on the property to ascertain the quality and position of the coal seams at a depth of 400 to 500 feet.

Lille Mine.

Safety lamps of the Wolf pattern have been installed in all districts where gas has been found. A considerable amount of prospect work has been done on this property in order to prove the thickness and quality of the coal.

Blairmore Mine.

This is a new mine which has been opened during the past year. The main and counter gangways have been driven a distance of 2,600 feet on strike of coal seam, which is 6 1-2 feet in thickness and is known as the No. 2 seam. A prospect tunnel is being driven to locate No. 4 seam. A coal dumping and loading station for railway cars has been erected and a spur track laid from the C. P. R. Crow's Nest line to the mine, a distance of about half a mile.

McGillivray Creek Coal & Coke Company, Limited, Coleman.

This is a new mine which has been commenced at Carbondale, near Coleman. No. 2 seam, which is 12 feet thick, is being developed. A steel tipple with a handling capacity of 5,000 tons per day is being erected by the C. O. Bartlett & Snow Company, of Cleveland, Ohio. A power house, built of masonry, has been erected, size 88 feet x 60 feet. A machine shop, 102 feet x 28 feet, also built of masonry, and fitted up with a full compliment of all necessary tools, and new offices have also been erected. The following machinery has been installed: One 150 k.w. Ridgway generator, for supplying power for locomotives, tipple and machine shop and for lighting purposes; one five ton electric locomotive with rack rail for hauling the coal from the mine to the tipple, a distance of nearly two miles; a Sirocco fan, electrically driven, capable of giving 60,000 cubic feet of air per minute with a 3-inch W. G. Steel cars with a capacity of 4 1-2 tons, with automatic couplings, are used. The mine track is being laid with 55-pound steel. Two 150-pound Waterous boilers have been installed. A well has been sunk and a water supply for the plant is pumped up to a tank with a capacity of 10,000 gallons. Railway sidings have been put in and foundations are being prepared for a box car loader.

The Davenport Coal Company, Burmis.

This property was formerly operated by the East Crow's Nest Coal Company, Limited. Considerable development work is being done, also grading for railway sidings. This mine should be a large producer in the future.

Leitch Collieries, Limited, Passburg.

The output for the past year from the old mine, which is south of the Canadian Pacific Railway, Crow's Nest Branch, is more than double that of 1908. Safety lamps of the Wolf pattern are now used throughout this mine.

A new mine has been opened about two miles north of the old mine and a seam of coal 15 feet in thickness is being developed. A spur track has been laid from the C. P. R., a distance of 1 1-4 miles, to where a tipple is erected, equipped with scales, shaking screens, picking tables, etc. A power house has been built and the following machinery installed: Two locomotive boilers, hoisting engine and low pressure air compressor.

Surface Plant of Canada West Coal Company, Ltd., Taber.

Galbraith Coal Company, Limited, Lundbreck.

No. 2 seam has been opened up and is being developed. The tipple has been extended and a revolving screen installed.

Maple Leaf Coal Company, Bellevue.

This company has opened up a new seam of coal during the last year and is now operating two seams. Monobel powder is used for blasting the coal and is giving good results. Safety lamps of the Wolf pattern are used throughout the mine.

Carbon Hill Coal & Coke Company, Burmis.

This company has done considerable prospecting during the past summer and has proved nine workable seams, some of which are over eight feet in thickness and of a good coking quality. It is expected that the railway which has been surveyed will be built in to the property in the early part of next summer.

The Head Syndicate, Limited, Lundbreck.

This company has done a considerable amount of prospect work, on what is known as the Hastings property, and has been successful in proving a seam of coal of excellent quality, with an average thickness of 10 feet and there are indications of other seams of a good quality on this property. Most of the prospect work has been done along the north side of Lynx Creek.

Western Coal & Coke Company, Limited, Pincher Creek.

This property is located in township 6, range 2, west of the 5th meridian, about 12 miles west of Pincher Creek. Considerable prospecting work was done on the property during the past summer, and several coal seams proved, one of which is seven feet thick and of a good coking quality. This seam is opened up by a tunnel, which has been driven a distance of 1,500 feet and will be used as a permanent opening. The following plant has been installed to carry on the work: Two boilers, one hoisting engine, two pumps. A number of temporary buildings have been erected, including offices, wash house, engine house, blacksmith shop, etc.

Alberta Railway & Irrigation Company, Lethbridge.

The steel tipple at the No. 6 mine referred to in the report for 1908 is now completed and is equipped with Ramsey pusher for caging cars, car retainers, cross-dumps, weigh scales, screens, picking tables, and necessary conveyors for handling four sizes of coal and rock. The tipple is designed for four loading and one by-pass track, and is fully equipped for handling 1,800 tons of lump coal in eight hours.

In addition to the tipple, the following equipment has been installed: Two sets of railway scales; Ottawa tilting box car loader; Sirocco ventilating fan, 114-inch diameter with a capacity of 200,000 cubic feet of air with the 6-inch W. G., rope driven with a pair of 16-inch x 36-inch Leonard Corliss engines; two units of Babcock-Wilcox water tube boilers, 500 h.p. each, equipped with Babcock & Wilcox chain gate stokers and induced draft; and two American Blower Company's fans.

The boiler house is built to accommodate two additional units of Babcock & Wilcox boilers, which will be installed when required.

The power house is built to accommodate three Rand air compressors, three electric generators, two boiler feed pumps, feed water heaters and hoisting engine. Of the above, the following are now installed: One duplex Rand air compressor, simple steam, cross-compound air, with a capacity of 3,000 feet of free air per minute; one 200 k.w. generator, A.C., direct connected to a Robb engine; two Wier boiler feed pumps; two feed water heaters; hoisting engine, 30 inches x 48 inches, direct connected to a 12-foot drum and equipped with a steam brake, steam throttle and Nicholson automatic stop. A travelling crane for erecting machinery has also been installed in the power house.

The shaft is equipped with cages 18 feet in length, each carrying two cars placed tandem, and plow steel hoisting ropes, 4 7-8 inches in circumference. The pit bottom is made large and roomy, the roof being supported with 18-inch steel beams. The underground workings are laid out for endless rope haulage.

Royal Collieries, Limited, Lethbridge.

The development of the underground workings in this mine has been pushed ahead rapidly during the past year and now an output of about 200 tons per day is produced and the indications point to a large increase in this output during the coming year. A number of new cottages for the workmen and new office buildings have been erected. Four Ingersoll-Sargent coal cutters have been added to the equipment of the mine.

Diamond Coal Company, Diamond City.

This company has during the past year installed the following equipment: One new electric generator, A.C., 105 k.w., 2,200 volts, 75.5 amp., 3 phase, 60 cycles, 240 r.p.m., direct connected to a Robb steam engine 15 inches x 16 inches, together with exciter, switchboard and necessary fittings, one Morgan-Gardner electric chain coal cutter; one Jeffrey electric chain coal cutter. A new branch line of railway has been laid from Kipp to the mine and equipped with locomotive, passenger coach, etc. This mine is now fully equipped for an output of 1,000 tons per day. The development of the underground workings is being pushed ahead and the indications point to a large increase in the output from this mine, which will add materially to the supply of domestic coal during the coming year.

LETHBRIDGE DISTRICT.

The Lethbridge district is the largest domestic coal producing centre in the province and will no doubt retain that position for some time to come. The building of the C. P. R. viaduct across the Belly River valley at Lethbridge has opened up a large coal area just north and west of the river, on which several prospect shafts have been sunk and a number of bore holes put down during the past year, with favourable results. The development work at the mines and prospect work throughout the district have been actively carried on during the year and from present indications there will be a substantial increase in the output from these collieries for the year 1910.

Canada West Coal Company, Limited, Taber.

The output from this mine is gradually increasing and has now reached 850 tons per day. An air shaft has been put down near the face of the main north entry and has reduced the length of the airways by 50 per cent. When the airways which are now being driven are connected, all ventilating doors can be removed from the main haulage road, which will facilitate to a certain extent the transportation of coal and will insure a more efficient supply of fresh air at the working face.

Great Western Coal Company, Limited, Taber.

This company has during the past year installed the following machinery: One Ingersoll low pressure air compressor, with a capacity of 800 feet of free air per minute; a number of coal cutters (Ingersoll puncher) with pipe lines and necessary fittings; two new Jenckes locomotive boilers and a new hoisting engine. The tipple has been remodelled and fitted with screens for sorting two sizes of coal.

Rock Springs Sootless Coal Company, Taber.

This company has during the year installed three locomotive boilers with a combined capacity of 300 h.p., one straight line single stage Ingersoll air compressor with a capacity of 1,000 feet of free air per minute, and nine coal cutters, viz.: Three Ingersoll-Sargent punchers, four Siskols and two little Hardies. A new tipple has been erected, equipped with scales, screens, etc. A spur line of railway and sidings and railway scales have been put in.

Alberta Consolidated Coal Company, Limited, Taber.

This company has during the year absorbed the Scranton and Central Coal Companies and has put in the following equipment: Three boilers with a combined capacity of 270 h.p., hoisting engine, one straight line single stage Ingersoll air compressor with a capacity of 1,000 feet of free air per minute, eight coal cutters (Ingersoll-Sargent punchers), and necessary pipes and fittings, a water supply system, including pumping station, 7,000 feet of 5-inch water main and stand pipe with a capacity of 40,000 gallons. A tipple has been erected, equipped with screens, etc., for sorting two sizes of coal. Railway sidings and spur lines have also been laid.

Other coal mines operating in the Taber district are as follows: The Bullock mine, operated by the Domestic Coal Company; the Independent mine, operated by Messrs. Fox & Simms; the Monarch mine, operated by the Monarch Collieries, Limited; the Hopeful mine, operated by John Howells; the Star mine, operated by the Southern Alberta Coal Company; the Golden West mine, operated by the Golden West Coal Company; the Superior mine, operated by the Superior Coal Company; and a number of small mines operated by individuals who each employ a few men. The total daily output of these mines is approximately three hundred tons.

The Taber district is now an important mining centre, being the third largest domestic coal producing district in the province, and when all the mines in that district are working full time the output reaches approximately fifteen hundred tons per day. Owing to lack of railway facilities, however, the smaller operators are only able to compete on the market during the busy season of the winter months.

A considerable amount of prospecting work has been done throughout the district during the year and a number of valuable coal properties proven, and indications point to a continued increase in production in this district during the next few years.

Medicine Hat, Grassy Lake, and Milk River Districts.

A few small mines are operating in vicinity of Medicine Hat, Grassy Lake and Milk River, but owing to lack of railway facilities the output so far is regulated to a great extent by local demand.

Little Bow District.

In the Little Bow district, about 50 miles north of Lethbridge, there are seven small mines operating, producing a few tons of coal, the output being regulated by the requirements of the settlers throughout the district.

Big Bow Collieries, Limited.

This property is located in township 17, range 17, west of the 4th meridian, on the Big Bow River, about 16 miles south of the C. P. R. main line. Considerable prospecting work was done on the property during the year and a 5-foot seam of domestic coal of good quality, with a sandstone roof, has been proved.

South Fork of the Old Man River.

A considerable amount of prospecting has been done in this district and a large number of coal seams have been proved. Owing to the lack of transportation facilities there has been practically no development work done yet. A number of different companies have secured extensive properties in this district, and with the coming of the railways a considerable production is to be expected. The coal is of a good quality and should find a ready market. It is expected that early next year a railway will be built from Burmis in to the Carbon Hill Coal & Coke Company's property, and from it branch lines into the other properties in the district.

Three Hills and Knee Hill District.

The mines in this district are being worked on a small scale. Owing to the lack of transportation facilities the amount of coal produced is regulated entirely by the local demand. It is expected, however, that within the next few months a railway will be built through this district so that when the railway does get through they will be in a position to ship a considerable output.

Edmonton Standard Coal Company, Limited, Edmonton.

During the past year this company has installed at their mine a hoisting engine, locomotive boiler and ventilating fan, and the output from the mine has been increased about 40 per cent. over that of the previous year.

Alberta Coal Mining Company, Limited, Cardiff.

The tipple at this mine has been remodelled and screens for three sizes of coal installed.

Ritchie Coal Company, Edmonton.

The following machinery and equipment has been installed at this mine during the past year:

A 50 h.p. Leonard return tubular boiler, hoisting engine, ventilating fan, two pumps, weigh scales and tipple capable of handling about 250 tons of coal per day.

Clover Bar Coal Company, Limited, Edmonton.

A spur line has been laid from the G. T. P. railway, a distance of about a quarter of a mile to where a new shaft has been sunk, and the following machinery installed: Two 100 h.p. Robb return tubular boilers; Hoppes feed water heater; hoisting engine, 14 inches x 30 inches direct connected to a 4 1-2-foot drum, and a 10 k.w. electric generator for lighting purposes and driving tipple machinery. The main entries in the old mine are being driven to connect with the new shaft and when the tipple and plant are completed all the coal from the old mine will be hoisted and dumped direct into railway cars.

Humberstone Coal Company, Edmonton.

This company has sunk a new shaft and installed the following machinery: Hoisting engine; locomotive boiler and two pumps. A temporary tipple has been erected and the main entries are being driven to connect with the workings of the old mine.

The output from the mines in the Edmonton district for the past year shows a considerable increase over that of 1908. This increase is, to a certain extent, due to the gradual widening of the market, more coal being shipped to outside points. The mines in this district are operated on a comparatively small scale, still the aggregate output taken from all the mines is fairly large and Edmonton stands as the second largest domestic coal producing centre in the province.

West of Edmonton the first coal lands that have been prospected are along the north side of Wabamun Lake. Small seams of coal crop out on the railway cuttings and a number of prospects have been sunk in the coal, which reaches a thickness of from 18 to 22 feet, with one band of shale about the centre ranging from six inches to a foot.

Further west we reach the crossing of the Pembina River where the coal can be seen out-cropping on the river bank. At this point coal mining has been carried on in a primitive way for a number of years. Besides these outcroppings on the river, a large amount of money has been expended in drilling on the property of the Pembina Coal Company, Limited, with very favourable results. The coal is of the same geological age as that prospected on Wabamun Lake, and in character very similar. Proceeding westward from the Pembina

River, the country is fairly well wooded, mostly with poplar, until about Mile 109, where there are some large spruce timber limits and a sawmill in operation.

The next sign of coal to be seen is at Wolf Creek, Mile 120, where a few small coal seams have been located, but nothing has yet been proved economically workable. The Grand Trunk Pacific Railway at this point crosses the mouth of Wolf Creek at a great height and also the McLeod River at a very high level.

Following the McLeod River westward, large beds of sandstone of the lower Laramie series are passed to Mile 142. In this vicinity it is intended that a branch railway will strike southward to tap the coal fields, following the high lands between the Embarras River and the McLeod River. At the head waters of the Embarras River a large amount of prospecting was done last summer by the Yellowhead Pass Coal & Coke Company. At least four workable seams have been prospected and several tunnels drifted in for about 100 feet. The lower seam is approximately 40 feet in thickness, but inter-stratified occasionally by bends of carbonaceous shale. The other coal seams are cleaner and should make a good steam coal. On the same line of strike southeast of this property is the coal property of the Pacific Coal Company, who own a large area, approximately 35,000 acres. This property has been thoroughly prospected and several tunnels driven in the lower seam. The southeast end of this property is on a different watershed, viz.: the Pembina River.

Crossing the Pembina River southward to the forks of the Brazeau River, which is one of the main branches of the North Saskatchewan River, a coal property has been located by the Canadian Northern Railway, on which there has been a fair amount of prospecting work completed and the coal field proved. This point is much nearer the mountains than any of the other coal properties. Directly due south of the main fork of the Brazeau lie the coal areas of the German Development Company, who have consolidated with the Canadian Northern Railway and are now termed the Rocky Mountain Collieries, Limited. These large coal areas have been thoroughly prospected by Mr. McEvoy, late geologist for the Crow's Nest Pass Coal Company, and according to his report in the CANADIAN MINING JOURNAL, the coke produced from these coals is at least equal to that produced from the coking coals of the Crow's Nest field. In this vicinity, which is townships 39, 40 and 41, ranges 17, 18 and 19, west of the 5th meridian, other coal areas have been located, but very little work has been done on them. Following the same strike of these coal measures in the vicinity of townships 43, 44 and 45, ranges 20, 21 and 22, other large areas of coal lands have been located and some prospecting work done on them.

Farther to the northwest, on the head waters of the McLeod River, which is the next watershed, coal areas have been located by the Canadian Northern Railway and other parties. These coal lands show an analysis similar to that of the Crow's Nest field. On the head waters of the west fork of the McLeod River a large area of coal lands has been located and fairly well prospected. The outcrops at this point are not so prominent as the strata is at a less angle.

Following the pack trail from the west fork of the McLeod River we reach the head waters of Gold Creek, which is on the watershed of the Athabasca River. About the mouth of Gold Creek and its junction with Prairie Creek, a coal seam about four feet in thickness has been located, of a high bituminous character. At the mouth of Prairie Creek we again reach the line of the Grand Trunk Pacific Railway.

Following the railway westward, passing through the Gap or Folding Mountain, another coal area has been located on Fiddle Creek, on which a fair amount of prospecting has been done. The folding at this point, however, is greater than that to the south, but the coal of a higher quality.

Farther west, towards the summit of the Rocky Mountains, small outliers of cretaceous measures have been located north of the railway, but no work has yet been done on any of them. The summit of the Rocky Mountains and the western boundary of Alberta is reached at Dominion Prairie, where the last outliers of the coal bearing cretaceous measures are found.

Work of Inspection.

The work of inspectors has materially increased during the year. The large number of new settlers who have been locating throughout the province has considerably increased the demand for domestic coal in the outlying districts, and has resulted in a number of small mines being opened in the lignite field. Some of these mines are located a long distance from the railways and it requires as much time to reach one of them and make an inspection as it does a large mine which is conveniently located. At the older mines the underground workings are expanding and becoming more difficult to ventilate, the haulage roads are increasing in length and the transportation of the output is being accelerated, requiring the installation of additional machinery, and as a result more time is required to make a thorough examination.

The new legislation commonly known as the "Eight Hour Law," which came into force on April 1st, has created a new condition at the mines respecting the hours of work, and the inspectors have had to devote a considerable amount of their time to the adjustment of the various difficulties met with in connection with the changes in the methods of operating the mines necessary to conform with the new regulations.

The inspectors have made their regular rounds of inspection of all the mines and investigated all fatal and serious accidents, in each case removing as far as practicable the dangers contributary to such accidents.

The installation of safety lamps and the use of permitted explosives in all the bituminous mines has received careful attention during the year and I am pleased to report that the opposition previously raised by some of the operators to the adoption of these safeguards is gradually decreasing. I might explain that while Alberta has no list of permitted explosives, we have up to the present been guided by the British permitted list.

Accidents.

From the list of accidents for the past year, it will be seen that there have been nine fatal accidents, seven of which occurred below ground and two on the surface. Of the fatal accidents below ground, three were caused by falls of roof, two by mine cars, one by suffocation by noxious gases and smoke from mine fire and one by a miner falling down chute. Both fatal accidents above ground were caused by parties being caught between the drawheads while in the act of coupling railway cars. The three fatalities caused by falls of roof occurred at the working face while the parties were engaged at their regular work. The fatal accident due to falling down chute occurred while the miner was returning from his working place.

All of the above fatalities were fully investigated by the inspectors, and from evidence given at the inquests they appear to have been purely accidental.

The fatal accident due to suffocation was the result of a fire on December 12th, which started from some unknown cause in the main intake airway of the Alberta Railway & Irrigation Company's No. 3 mine. In this case the stable boss, Fred Berresford, while endeavouring to reach the stables and save the horses, which were located some 2,000 feet away from the seat of the fire, was overcome by noxious gases and smoke.

The two fatal accidents caused by mine cars occurred in the mine of the Canadian Coal Consolidated Company, Limited, by parties being caught against chutes while riding on mine cars, in contravention of the special rules and a notice which was then posted at the mine. Had the special rules and notice been observed by the persons for whose guidance they were posted, these accidents would not have occurred, but the most explicit instructions are ineffective at times, and in view of this the inspectors have taken steps to remove this danger as far as possible by requiring such changes in the construction of chutes as local conditions will permit.

Compared with 1908, the number of fatal accidents shows a decrease of two, and the number of non-fatal accidents an increase of seven. However, the production of coal has increased proportionately, so that the average number of tons of coal mined per non-fatal accident remains approximately the same.

Tabulated List of Accidents Above and Below Ground.

Cause.	Fatal. Above	Fatal. Below	Serious. Above	Serious. Below	Slight. Above	Slight. Below	Total
Fall of roof and sides	..	3	..	14	..	4	21
Gas explosions	..	..	..	1	..	6	7
Explosives	..	..	..	1	..	3	4
Mine cars	..	2	6	10	2	2	22
Railway cars in mine yards	2	..	..	..	..	..	2
Falling down chutes	..	1	..	1	..	..	2
Cages and shafts	..	..	..	1	..	1	2
Other causes	..	1	5	3	..	..	9
	2	7	11	31	2	16	69

The following list indicates the average number of tons of coal mined each year per fatal accident for 10 years ending December 31st, 1908, and includes all fatal accidents in connection with the operation of mines above and below ground. It might be explained that the comparison from 1899 to 1905, inclusive, is taken from the reports of the Government of the Northwest Territories, which included the present provinces of Alberta and Saskatchewan, and the comparison for the years 1906 to 1908, inclusive, are for the Province of Alberta only:

Number of Tons of Coal Mined per Fatal Accident.

Year.	Tons.
1899	86,556
1900	22,948
1901	115,549
1902	63,836
1903	103,823
1904	130,488
1905	67,756
1906	138,500
1907	96,566
1908	167,727

From the above list it will be seen that conditions with regard to fatal accidents are gradually improving, as the figures show the average number of tons of coal mined per fatal accident for the period of ten years ending December 31st, 1908, is 99,375, while the period of five years, 1899 to 1903, inclusive, shows an average of 78,542 tons mined per fatal accident, and the period of five years, 1904 to 1908, inclusive, shows an average of 120,207 tons, which is an increase over the five years 1899 to 1903, of 41,665 tons. The records for the years 1908 and 1909 were much more satisfactory, there being an average of 167,727 tons mined per fatal accident for the year 1908, or an increase of 29,227 tons over the highest previous year, and an average of 241, 592 tons for the year 1909, or an increase of 73,865 tons over that of 1908.

Schedule of Accidents in Coal Mines During 1909.

(Above and Below Ground.)

Mine and location.	Resulting Fatally	Serious Injury	Slight Injury	Total of Accidents
International Coal & Coke Co., Ltd., Coleman	1	9	3	13
Alberta Railway & Irrigation Co., Ltd., Lethbridge	1	5	3	9
Canada West Coal Co., Ltd., Taber	1	4	2	7
Bankhead Mines, Ltd., Bankhead	1	4	1	6
Canadian Coal Consolidated, Ltd., Frank	3	1	1	5
Royal Collieries, Ltd., Royal View	..	4	1	5
West Canadian Collieries, Ltd., Bellevue Mine	1	2	1	4
West Canadian Collieries, Ltd., Lille Mine	..	2	..	2
Twin City Coal Co., Ltd., Strathcona	..	..	3	3
H. W. McNeill Co., Ltd., Canmore	..	3	..	3
Ansley-Pruitt Coal Mining & Mfg. Co., Medicine Hat	..	1	1	2
Leitch Collieries, Ltd., Passburg	1	1	..	2
Strathcona Coal Co., Strathcona	..	2	..	2
Pincher Creek Coal Mining Co., Ltd., Pincher Creek	..	..	1	1
Cardiff Coal Co., Ltd., Cardiff	..	1	..	1
Great Western Coal Co., Ltd., Taber	..	1	..	1
Clover Bar Coal Co., Ltd. Edmonton	..	..	1	1
Diamond Coal Co., Ltd., Diamond City	..	1	..	1
McGillivray Creek Coal & Coke Co., Ltd., Coleman	..	1	..	1
Total	9	42	18	69

During the year 1907 there were 24 accidents, including fatal, serious and slight, due to explosions of gas and powder and in 1908 there were 14 accidents due to the above causes, while the year 1909 shows but 10 accidents due to these causes. The decrease in the number of fatal accidents for the past two years is largely due to the installation of safety lamps and the use of permitted explosives. From our records on file it is quite evident that all our most serious accidents which have each resulted in a number of deaths in previous years have had their origin in the flame of an open light or by the improper use of explosives, and it would appear that in order to avoid serious accidents the most effective remedies are the installation of modern and securely

locked safety lamps, permitted explosives, and the careful supervision of shot-firing, in all mines where gas is given off or where dust is present in dangerous quantities.

Wages.

The scale of wages paid in the province during 1909 was practically the same as that paid during the two previous years.

The general wage schedule for day labour is as follows:

INSIDE MEN.

Fire bosses	$85.00 to $110.00	per month.
Shotlighters	$3.00 to $3.50	8 hours
Bratticemen	3.00	8 "
Bratticemen helpers	2.50	8 "
Timbermen	3.00	8 "
Timbermen helpers	2.75	8 "
Drivers	2.75	8 "
Drivers, wet places	3.00	8 "
Team drivers	3.00	8 "
Tracklayers	3.00	8 "
Tracklayers' helpers	2.75	8 "
Rock miners	3.50	8 "
Miners	3.00	8 "
Miners, wet places	3.50	8 "
Locomotive engineers	3.00	8 "
Switchmen	2.75	8 "
Chute loaders	2.75	8 "
Labourers	2.50	8 "
Timber handlers	2.75	8 "
Machine men	3.50	8 "
Machine men helpers	3.00	8 "
Switch boys	1.50	8 "
Door boys	1.50	8 "
Hoistmen	3.00	8 "
Rope riders	2.75	8 "
Couplers, boys	1.50	8 "
Couplers, men	2.50	8 "
Pushers	$2.75 to 3.00	8 "

OUTSIDE MEN.

Pithead men	$2.50	10 hours
Dumpers	2.50	10 "
Slate pickers, men	2.00	10 "
Slate pickers, boys	1.25	10 "
Car oilers, boys	1.25	10 "
Car oilers, men	2.00	10 "
Tally boys	1.25	10 "
Teamsters	2.50	10 "
Blacksmiths	3.50	10 "
Blacksmiths' helpers	2.50	10 "
Mine carpenter	3.50	10 "
Mine carpenter helper	2.50	10 "
Car repairers	3.00	10 "
Power house engineers	3.50	12 "
Tipple engineers	3.25	10 "
Locomotive engineers	3.25	10 "
Locomotive engineers' helpers	2.80	10 "
Firemen	2.50	8 "
Car handlers	2.40	10 "
Fanmen	2.50	12 "
Outside labourers	2.25	10 "
Fan firemen	3.00	12 "
Lampmen	2.50	12 "
Machinists	3.20	10 "
Machinists' Helpers	2.50	10 "
Couplers	2.25	10 "
Sawyer	3.00	10 "

Prospect Work.

The number of new railways which have recently been projected throughout the province has had a tendency to renew the activity in prospecting and locating new coal areas. This is especially the case as regards the bituminous fields.

The coal field in the district lying west of Edmonton has only been partially explored, but several large coal areas have been located, on which a number of seams of good bituminous coal have been prospected and proven.

In the Cascade Basin, or in that part of it known as the Kananaskis Valley, the prospect work which was previously well advanced has continued during the year, and according to the report of Mr. D. B. Dowling, of the Dominion Geological Survey, this field contains a large number of easily accessible coal seams which crop out in various places along the sides of the mountains, and when a railway is built into the field a considerable output can be got in a short time.

The large amount of prospecting work which has been carried on south of the Crow's Nest line of railway, in the district known as the South Fork of the Old Man River, has demonstrated that this coal area is equally as large and will eventually be as important as that which is now being worked in the Frank-Coleman field.

West of Lethbridge, along the Macleod-Lethbridge cut-off, a number of bore-holes have been put down by the Lethbridge Collieries, Limited, which have proven that the coal area known as the Lethbridge coal field extends a considerable distance north and west of the present collieries.

During the past year a number of new mines have been opened throughout the province which are being developed very rapidly and present indications point to a substantial increase in the total output of coal for the year 1910.

Portland Canal Mining Company, Limited

Manager's Report.

Stewart, B.C., October 1st, 1910.

C. H. Dickie, President,
Portland Canal Mining Company,
Duncan, B.C.

Dear Sir,—On September 24th both water-wheels at the concentrating mill were run as a trial. Everything moved off in a satisfactory manner. From that date until yesterday one machine after another was connected, the crusher being started on September 27th. Yesterday the first ore was fed into the jigs and tables and our next work will be the adjusting and gauging of their capacity, bedding the jigs and gradually tuning up the plant for the serious work it has in store.

The mill is a substantial and complete one of which no engineer need be ashamed. It is built primarily with regard to economy of operation and with a future increase of capacity in view. A mill which apparently might answer the purpose could have been built for less money, but it would not have lasted so long, done the work so well, nor operated at as low a cost as this. All the work of construction has been well done and the mill with its magnificent water-power is worth many times what it has cost.

It gives me pleasure to report that the separation of the galena from the pyrite and of both from the gangue is easily effected. The ore concentrates more perfectly

than I expected, and I have not seen any from which the gangue was more easily removed. There has never been any reason to doubt that the ore would concentrate successfully, on the contrary, the tests of two years ago were quite conclusive, but the accomplishment of an undertaking of this sort, even if fully expected, is most satisfactory.

The grade of the feed to the mill is for manifest reasons, low for the present. It would be folly to put high or even average, grade ore through until all the machines were adjusted to make a proper saving. As it is needed a better grade of ore will be supplied until the average ore which the mine can continuously produce is reached. Just what this grade will be no one can possibly tell, but it will not be far from that given by me in my report of August 28th, 1908, as the average from No. 1 and No. 2 ore dumps. Such ore will be more profitable than the tests made at that time would indicate because a much cleaner concentration can be made than was then effected.

Development work at the mine has been uniformly satisfactory. The ore body now being opened by the No. 2 and 3 tunnels is proving larger than any other in the mine. Both are in good ore from which high-grade specimens may be obtained and which will average at least as well as the rest of the ore. At one point nearly five feet in width of almost solid ore is exposed and is notable for the increase of lead which it shows. The next one hundred feet on the No. 3 level is most important ground and will develop splendidly judging from the surface and levels above.

From the A raise a new stope has been started which will supply ore when needed. The assays from this point show a higher gold content than the average and this should make good feed for the mill. The ore is about four feet wide.

The B raise is now up more than half way to the No. 1 level and has about thirty feet more to go. There is three feet of ore in the face of this working to-day. With its completion an underground connection down through the mine will be provided and the ore above No. 1 can be economically extracted.

The tunnel on the Eclipse claim, which develops the vein in place about one thousand feet north from and four hundred feet below the No. 3 tunnel, shows a strong seam of ore, mixed in character and about a foot wide, although it probably is not in an ore shoot. Work here has been discontinued for the present, but should be resumed next summer as this is a most important point from which to prosecute development.

I have so often expressed my confidence in the future of the mine that to repeat it now seems superfluous. Its development is fully justifying my expectations and the ore opened is worth many times the company's expenditures for purchase, development and improvement and at no time in the past has it looked so well or promised so much as it does to-day.

All the new buildings, which were badly needed both at the mill and mine, are completed and occupied. These are commodious and furnish many comforts which should insure obtaining the best of labour for the company's requirements.

I remain,

Yours truly,
W. J. ELMENDORF,
Manager.

The Dominion Government is building a telegraph line between Stewart and Portland Canal.

Le Roi Mining Company in Liquidation

Acting on the advice of the company's consulting engineer, Mr. W. A. Carlyle, of London, the shareholders will not spend more money in exploring in the Le Roi mine, at Rossland, B.C., for other shoots of ore of good grade, but have decided the company shall go into voluntary liquidation. Mr. Carlyle reports that during the last ten years a large amount of exploration work has been consistently done, including much diamond-drilling, of which 27,000 feet have been bored since June, 1906, and of this 15,000 feet within the last twelve months. He says, further, the last of the known pay ore is being stoped out and realized upon. To effectively explore for more ore at least $500,000 would have to be provided, but with the knowledge of the mine now possessed after the extensive exploratory work done during the last twelve months, he cannot hold out any hope that there is a prospect of success, even if the large expenditure of money it would require were made.

The company has valuable assets, free and unencumbered by mortgage, and has no debenture issue. Its debts, outside of current expenses, total about $55,000, against which there is cash on hand and money due for ore and smelter products shipped, together approximately $40,000.

A statement published two years ago showed that from February, 1894, to September, 1908, there had been taken from the Le Roi mine 1,445,246 tons of ore, containing 689,057 ounces of gold, 1,038,906 ounces of silver, and 41,600,740 pounds of copper, together of a value of $20,406,627, or an average of $14.12 per ton. Production since then (the mine continues to make a small output) has been between 40,000 and 50,000 tons, worth, say, $500,000, so that the aggregate production to date has been in gross value, approximately $21,000,000.

The Le Roi Mining Company, Limited, was organized in London, June 17, 1898, under the laws of Great Britain, with capitalization £1,000,000, shares £5 par, fully issued and fully paid. Only £50,000 working capital was provided, but as on November 7, 1899, a dividend of five shillings per share was paid, it has had actually no cash capital from the shareholders for development or equipment purposes. Two dividends were paid in 1906, after Mr. A. J. McMillan took charge of its affairs, one shilling and sixpence in March, and two shillings in November. Prior to sale by its Spokane, Washington, owners to the British America Corporation, London, in January, 1898, the Le Roi had paid its American shareholders $995,000 in dividends. Under British ownership much money has been spent in expensive machinery, equipment, sinking the main five-compartment shaft 1,700 feet, and other important underground development, and purchase of the smelting works at Northport, Washington.

It may be interesting at this time to quote from an address of welcome made by Mr. Campbell Sweeny, manager of the Bank of Montreal, Vancouver, to the members of the Western Branch of the Canadian Mining Institute when they met in Vancouver last January. He said, in part: "We have what I think to be one of the most extraordinary mines in the world, namely, the Le Roi mine at Rossland. It is a fact, gentlemen, that to-day there is not one dollar—not a penny piece—of anybody's money in that mine. There was once put into it a few thousands pounds, but within a short period the money was drawn out again, and since then the whole

of the large amount of development work and the extensive equipment of the property have been paid for out of the products of the mine. Yet people in England will say, 'We don't want to hear anything about your British Columbia mines. We have your damned Le Roi, and we never got a penny out of it.' But they must be prepared to take similar risks in British Columbia mines to what they have done in those of the South African Rand if they would make the mines in this country become profit-producing. Old Country people put hundreds of thousands of pounds into Rand mines before they made any profit out of them. They knew well they had to put it in if those mines were to be properly developed, and having put it in, a return came to them in due time, and ever since then they have been receiving dividends from some of those mines. Money must first be put into mines if extensive and effective development is to be secured, and after we get sufficient money put into our mines we shall have them properly developed, and many of them will yield profits and reflect credit on those operating them." It may be added that, as the senior officer of the Bank of Montreal in British Columbia, which for some years financed the Le Roi mining and smelting enterprise, Mr. Sweeny had been in an exceptionally favourable position for knowing the conditions under which the company had been operating, so spoke with knowledge of the subject.

White Pass and Yukon Railway Rates

Among other matters before the Dominion Railway Commission at its sessions held in Vancouver on September 7 and 8, was a complaint by Col. J. H. Conrad (whose name several years ago was prominently before the public in connection with the development of several mineral claims in Windy Arm district, Southern Yukon) alleging against the White Pass & Yukon Railway excessive freight charges on ores from Carcross (Caribou Crossing, as it was at one time known) to Skagway, and on mining machinery and supplies from Skagway to Carcross.

There is no doubt that in the case of copper mines in Southern Yukon, the railway charges have been considered altogether too high to admit of the mines being worked without loss since the fall in the price of copper, and that consequently they have been idle. But the mines Colonel Conrad represents are not copper mines, it being understood that silver is their chief valuable metal.

According to the newspaper reports, the proceedings before the Commission showed evidence of much bitter feeling existing between Colonel Conrad and Mr. S. H. Graves, the president and general manager of the railway company. The complainant claimed that he went ahead with mining development on the assurance that he would be charged an average freight rate of $2.50 per ton on incoming shipments, and $2 per ton on ore shipments to tidewater at Skagway. The mining companies in which he is interested, the Colonel says, employ several hundred men, while a concentrator in operation at Windy Arm is stated to have a capacity of 200 tons a day. No ore is being shipped from the mines pending a decision by the Railway Commission as to freight rates. The question of excessive passenger rates was not included in the complaint for the alleged reason that sooner than pay a charge of 18 cents per mile, the miners when they got out in the fall walk to Skagway. Great stress was placed by Colonel Conrad on his assertion that the mines he represented had had $800,000 spent on them.

It transpired that the rate charged the Conrad mines was $3.75 per ton, whereas the Atlas Company's Pueblo mine, in Whitehorse copper camp, had been granted, under a secret agreement, a special rate of $2.50 a ton, of which agreement no copy had been filed with the Railway Commission, which default Mr. Graves was informed by Judge Mabee, chairman of the Commission, constituted a violation of the Railways Act. Continuing, he said: "You want to do what you please, but the law says you shall not. It is against these secret bargains and contracts that the law has struck. A man who ships a ton of hay for his cow is entitled to the same rate as a man who ships a thousand tons for the upkeep of a thousand cows. That principle has limitations, but a secret contract in the teeth of a printed tariff certainly does not come within those limitations. If it were left to the railway companies to decide, it would allow them to discriminate to the enrichment of one locality and the impoverishment of another. Surely you, as president and manager of a railroad, are acquainted with the Railways Act. If not, I would advise you to buy a copy of the Act and study it."

The decision of the Commission was, in effect, that the freight charge on ore and concentrates from Carcross to Skagway shall be $1.75 per ton; that the complaining companies shall be granted similar facilities for shipment of their ore as the Atlas Mining Company, in Whitehorse camp, and that a copy of the tariff shall be published and the rates adhered to.

Personal and General

Mr. Absolom Beaton, manager of the Dominion Coal Company's No. 2 Colliery, died suddenly from heart failure while on his way to the colliery on the morning of the 12th of October. Mr. Beaton has been manager of No. 2 Colliery since the beginning of 1908, having previous to that been the manager of No. 9 Colliery. This is the first death that has taken place among the mine managers during the time the Coal Company has been incorporated.

Mr. O. B. Smith, Jr., superintendent of the Granby Consolidated M. S. & P. Company's copper mines at Phoenix, B.C., recently visited Spokane, Wash.

Mr. Wm. Rowe, for years a mine superintendent in the Boundary district of British Columbia, is now superintending development work on the coal lands near Burmis, Southwest Alberta, of the Head Syndicate, Limited, of London. Mr. Leslie Hill, of Nelson, B.C., is consulting engineer and manager in Canada for the syndicate.

Mr. R. W. Brock, Director of the Geological Survey Branch of the Canada Department of Mines, has returned to Ottawa from Los Angeles, California, whence he went to attend the thirteenth annual session of the American Mining Congress, held September 26th to October 1st, inclusive. Among other men formerly engaged in mining in Canada, Mr. Brock met at the congress were Mr. S. F. Parrish, at one time general manager of the Le Roi Mining Company, and Mr. J. Cosgrove, who was at the Centre Star mine, also at Rossland, B.C.

Mr. Robert R. Hedley, for some time in charge of the development of Long Lake mine near Sudbury, is now mining engineer and technical adviser to the Canadian

Mining Operators, Limited, a company recently organized at Vancouver, B.C.

Mr. W. M. Brewer, of Victoria, B.C., recently returned to that city after having spent the summer in the North, in the interests of the Pacific Metals Company, Limited, of which he is president.

Mr. G. G. S. Lindsey has returned to Toronto from a trip to British Columbia. While in the West Mr. Lindsey visited Portland Canal and Sheep Creek mining camps, in both of which numbers of new mining properties are being developed.

Mr. W. H. Aldridge, managing director of the Consolidated Mining and Smelting Company of Canada, Limited, has been paying a business visit to Toronto and Montreal.

Mr. E. J. Conway, who graduated in metallurgy at McGill University in 1909, and afterward was assayer at the Whitewater mines, Slocan district, B.C., is now with the Tyee Copper Company, a mining and smelting company of excellent standing, operating on the Pacific coast.

Mr. John Hopp, one of the largest operators in hydraulic gold mining in British Columbia, has returned to Cariboo from the coast, where he has been recuperating following ptomaine poisoning, from which he suffered during several weeks.

Dr. A. E. Barlow has changed his place of abode from 51 Trafalgar Avenue, Montreal, to 328 Roslyn Avenue, Montreal.

Mr. Alex. H. Smith has returned from Mexico and is at present in Porcupine. Mr. Smith's Toronto address is 19 Wellington Street West.

Mr. R. B. Lamb, of 15 Broad Street, New York, has opened an office in Room 703, Traders Bank Building, Toronto. Mr. Lamb has had long experience in both Australian and American mining and metallurgical practice. For some time henceforward his residence will be in Toronto.

Correspondence

To the Editor CANADIAN MINING JOURNAL:

Sir,—In the summary report of the Mines Branch of the Geological Survey of Canada for the year 1909, page 20, I notice the following, "Mr. Theo C. Denis was intrusted with the examination of the manganese ore deposits which formerly were actively worked in the Maritime Provinces, with a view to investigating the causes which led to their abandonment. It was thought that some of these mines might be re-opened as a source of manganese for the steel industry in Canada and the United States." At pages 58-63 Mr. Denis tells us, he visited four abandoned properties in Nova Scotia and three in New Brunswick. From the examination of these he concludes, "that the manganese deposits of the Maritime Provinces are irregular and pockety" and that "the nature of such deposits does not permit of the installation of plants for economic mining and handling cheaply large quantities of material." There is one redeeming feature, however, "the ores are very high, pure and applicable to the uses which require the greatest purity."

If we are to infer that the report of Mr. Denis is a report on the manganese deposits of the Maritime Provinces or of the "Canadian ores of manganese" then we can only conclude that the total area of these deposits is included in a district in each of the two provinces each having a radius of not more than eight or ten miles. This would be very misleading. If the only information the Department of Mines required was, to know whether these abandoned mines might be re-opened as a "source of manganese for the steel works" it is regrettable that the valuable services of Mr. Denis should have been wasted, when a letter addressed to either of the steel works in Nova Scotia or to their mining engineer would have furnished much more reliable and valuable information than it was possible for Mr. Denis to obtain from local farmers or lumbermen.

I do not for a moment attempt to criticize the ability of Mr. Denis to make an intelligent examination and report on these deposits, if he were allowed the time and had an opportunity to make the necessary examinations, but such a report as that published by the Mines Branch on these deposits is not only misleading but useless and detrimental to the industry.

The geological horizon carrying manganese deposits in Nova Scotia, extends irregularly from Kings County on the west, eastwardly through Hants and into Colchester County. Deposits also occur in the Counties of Pictou, Cumberland, Lunenburg, and the four counties of Cape Breton Island. Within this territory some of the deposits are very promising; as the Loch Lomond deposit in Cape Breton County formerly operated by the late Hon. E. T. Mosley; the East River deposits of Pictou County, where the ore is only suitable for steel manufacturing. Small lots have been mined for that purpose. The deposits at Manganese Mines, Colchester County, Pembroke and Cheverie, Hants County, have all been operated in the past for high grade ore, and some of these show better indications of producing ore suitable for steel purposes than any of the deposits of Nova Scotia visited by Mr. Denis. In Lunenburg County the reported developments during the past few years have shown that the manganese deposits there have greater magnitude and more regularity than any other deposits yet discovered in the Maritime Provinces.

No mention of the above named properties nor of many other prospects has been made in this report; nor has any notice been taken of that large manganese bearing area of the Magdalen Islands, which geologically resembles very closely the deposits in the Batesville region of Arkansas.

It may be true, but very questionable, that the Maritime Provinces cannot produce any valuable deposits of manganese suitable for steel purposes. It certainly is not fair to the country to make public such an assertion on the evidence gathered from Mr. Denis' casual glance at a few abandoned mines which are full of water and offer no opportunity for examination. To one who has made a study of these deposits it is simply ludicrous to speak of these few abandoned properties visited as "The Canadian ores of manganese."

We are told that the ores are "irregular and pockety." This is the same old cudgel that has been beating the life out of Nova Scotian mines for many years. I should like to ask from what source this information that the ores are "irregular and pockety" was gained? It certainly was not gained from underground examination. Will the Department of Mines kindly tell what difference it makes if the ore is pockety provided the pockets are large enough for profitable mining, or if irregular in formation if the irregularities are understood?

Again, from the same source we gather the information that these deposits will not permit the installation of plants for the economic handling of large quantities of material. On this point Mr. Denis' informant was in

error. When the formation of manganese ores is thoroughly understood, then the mining of it is not so uncertain, particularly in Nova Scotia. The principal reason for closing Tennycape mines (one of the abandoned mines visited) was the lack of machinery for handling cheaply large quantities of material. In this mine there are thousands of tons of material carrying from 15 to 25 per cent. of high grade pyrolusite that was wasted for want of machinery to handle it cheaply. This is also true of the 50,000 tons of dump material at this mine which has been estimated to contain 10 per cent. or more of manganese lost for lack of modern concentrating machinery.

There can be no question that the information given by the Department of Mines from time to time has been of great value, but this value does not consist in such reports as the one published on the manganese deposits. It is submitted that not only should it be the aim of the Department of Mines to tell us of what grade our ores are but also to tell us what value they have in the market and what market they are suitable for. This report tells us the manganese ores are of exceptional purity and would probably bring better prices for some other purposes than the steel industry. The advice that the operator should proceed cautiously and look carefully into the markets, etc., is rather obsolete. It would be much better to advise how to proceed economically and intelligently in mining and give the necessary information regarding the uses and demand of these ores of "exceptional purity." How to prepare them for the market so as to get the greatest possible value, and how to avoid the conditions of the past when the miner had to deal with the middleman and thus lose a great part of his profits.

Above all it should be the duty of the Department of Mines to be very cautious in making reports on ore properties without a thorough knowledge of them. A mining engineer depending on his reputation for a living would live but a short time after making such a report as this on the manganese deposits of the Maritime Provinces.

W. F. JENNISON.

Truro, N.S., Sept. 16th, 1910.

The Editor CANADIAN MINING JOURNAL:

Sir,—Your interpretation of the term "intellectual proletariat" in No. 16 of the CANADIAN MINING JOURNAL, though in general correct, is not quite exact. The growing tendency towards university education in Germany in recent years has had the effect of overcrowding the professions to such an extent that the average yearly earning of a medical man in Berlin does not exceed $750, and the most highly-trained chemists and engineers eagerly seek situations which bring them in $600 annually.

This overproduction of "trained intellect" has resulted in the swelling of the ranks of the dissatisfied political party, "the Social Democrats," and later the forming of unions, among medical men for instance, similar to those of the working men over here.

The term "intellectual proletariat" was first used in Parliament by a member who was commenting on the extraordinary increase of the Social Democratic party by men whose university education should have taught them better than to allow themselves to be identified with this party.

Yours truly,

MARTIN NORDEGG.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay: Dominion Coal Output.—The aggregate output for the nine months ending 30th September was 2,608,000, comparing with 2,097,000 tons for the same period of last year. The output for the first nine months of 1908 was 2,867,179 tons. The output for the whole year will be about three and a half million tons, which will be a return to the figures reached in the years 1906, 1907 and 1908. For some years past the Dominion Coal Company's mines have had an output capacity of four million tons per annum, but the Hub mine fire in 1906, the trade depression in 1907 and the U.M.W.A. strike in 1909-10 have in their turn prevented the passing of the three and a half million mark.

The output of the mines for the four months June to September has never been exceeded, and if October outputs reach 350,000, as they probably will, an average of over 352,000 tons per month will have been maintained over the major portion of the shipping season. The actual figures are as follows:

	Tons.
June	358,069
July	354,022
August	350,090
September	348,234
October (Estimated)	350,000
	1,760,415

This is a very good and consistent average, and never before in the history of the company has so much coal been extracted in so limited a time.

The Coal Company is considering the erection of a modern washery to replace the one destroyed by fire several years ago. Quotations have been asked for. The site has not yet been selected. This is a further indication of the company's intention to keep pace with its American competitors in the preparation of coal for the market.

The exhaust-steam turbine and condensing plant at No. 2 colliery are nearing completion. The company has also under consideration the erection of a brick smoke-stack at this colliery to replace some of the steel stacks now in use, and the installation of an automatic coal-handling plant. All these additions will add to the efficiency and economy of the power-producing plant at this colliery.

ONTARIO.

Cobalt, October 19.—Between bad transportation and lack of power the South Lorrain camp has been little more than marking time this year. Now the Mines Power Company, which is producing power at the Matabitchouan five miles away, has received new transformers for the Brady Lake station at Cobalt and is shipping the old transformers to Beaver Lake where the substation to serve the South Lorrain camp is only waiting for the machinery. The company promises to deliver power by the end of this month and it is most probable that compressors in South Lorrain will be running with the juice before the freeze-up.

Before ice on Lake Temiskaming prevents the transportation of ore across to South Temiskaming and Mattawa the Keeley will ship two cars of ore, one high and one low grade. This company, controlled in England, late this summer struck a rich streak of ore in their vein and are raising it regularly from their 100 foot level. The station has been cut at the 170-foot level and the vein which has been dipped slightly will be cut

in a few days. As at the 100-foot level it showed much richer in the bottom of the drift than in the roof, the management has hopes of striking into good ore.

In the third quarterly report of the Crown Reserve for this year the balance shown is $610,595.50. The surplus at the end of 1909 was $549,275.42, and the surplus for the year so far is shown as $61,320.08. At the present rate each dividend means a disbursement of $265,322.10 and this year the Crown Reserve has paid to shareholders $795,966.30. Out of 77 cars shipped 23 cars were of high grade and the remainder low for the year to date.

It is reported that a syndicate of Cobalt and Toronto men is attempting to obtain control of the Silver Bar in order to work it. The amount to be raised, it is stated, is $50,000, and with it the $35,000 owed by the company will be paid and the remainder devoted to development. The Silver Bar continued to develop rather languidly till a year ago, when the shaft house was burned down. It was never rebuilt.

The Buffalo mine shipped seven bars of bullion on Oct. 15. Eight mines have now contributed to the bullion output of the camp. The record reads: O'Brien, Buffalo, Nova Scotia, Temiskaming, Crown Reserve, Cobalt Gem, La Rose, Beaver. Altogether, a value of $274,171 has been shipped in bullion from the camp. Four-fifths of this goes to London, England, to the Bank of England brokers.

At the annual meeting of the City of Cobalt Mining Company it was decided not to declare a dividend this year but to devote the surplus showing to the development of the property and the search for further ore bodies. The balance profit and loss for 1909 was $179,900.51; cash received from smelters, $103,335.16, making total assets of $283,235.67. The royalty T. & N. O. Commission, $5,111.11; concentrator charges, $18,493.11; freight and smelter charges, $7,046.24; balance, $252,585.21. The superintendent's report shows that 253,000 feet of stoping have been done in the mine and 7,750 feet of drifting and cross cutting. In 1910 the City has shipped 361 tons, six cars of screening and low grade and six cars of high grade and concentrates. As reserves, it is estimated that there are 7,000 tons containing 175,000 ounces left in the mine. On the dump there is estimated to be 250,000 ounces, making a total of 425,000 ounces.

In the west drift of the Bailey Cobalt at the 252 foot level a well defined vein carrying high grade silver values has been cut. On the same level four stringers, all carrying good silver values, are being followed. Arrangements have been made with the liquidator of the Cobalt Central to treat some of the Bailey ore.

A Quebec syndicate named La Compagnie Miniere de la Vallee du St. Maurice is going to do some work on an island in Sasaginaga Lake just to the west of Cobalt. A shaft will be sunk a hundred feet and camp buildings erected. Mr. Sydney Smith is the consulting engineer for the property.

The Kerr Lake Mining Company has again declared ten per cent., five per cent. regular and five per cent. extra, for the fourth quarter of the year. The company's record for 1910 now reads 40 per cent., or $1,200,000.

The two veins in the west drift of the Cobalt Provincial mine at Cobalt at the 175-foot level have merged and now show about five inches of ore, considerably richer than when the two ore bodies appeared to be separate.

The whole of the assets of the Standard Cobalt Mines will be sold by public auction on December 28. The assets of the company in a bill of sale are estimated to be worth $1,925,756.03. It is stipulated by the terms of sale that the ore in the bins belongs to the liquidator and the purchaser has to mill it at a fixed rate of not more than $2.75 a ton.

Last month the Savage mine of the McKinley-Darragh group produced 48,700 ounces. In the cross-cut from the No. 4 shaft at the 80-foot level a strong calcite vein carrying cobalt and silver values has been cut. From its location and appearance it is expected to make ore soon.

Taking with them a Cobalt engineer, a number of Montreal business men have gone up to Guibord Township to examine the claims of the Gold Pyramid Company, with a view to purchase if the report is satisfactory. The men interested are directors in the Thelma Gold Mining Company in Bryce Township.

Considerable work is being done at the Maiden Silver Mining Company of South Lorrain. From the 85-foot level a cross-cut has been pushed 75 feet to catch the No. 1 vein which, on the surface, showed smaltite with good silver values.

The Temiskaming Mining Company decided at a late meeting at the mine to pay a dividend of 3 per cent., which will mean a disbursement of $75,000. With this dividend to be paid on Nov. 1st the Temiskaming will have paid 24 per cent., or $584,156.25. The last dividend was paid on April 11, 1909. The vein at the 500-foot level of the mine has been cut but no ore shoot of any high grade value has been encountered yet.

The Right of Way is conducting operations on the south end of the property by means of three shafts. The three principal veins are furnishing good high grade ore and shipments of one car of high and two of low grade are being maintained month by month. Prospecting work is being conducted from the Little Nipissing shaft where a cross-cut is being driven northward to open up unexplored ground.

Gowganda.—The Three claims belonging to the O'Gorman-Sweete syndicate, eight miles south of Gowganda in the Hanging Stone District, have definitely been taken over by the Temiskaming & Hudson Bay Company, who have just made the first payment. Some remarkable surface finds were made and the New Liskeard syndicate did not make first payment until a considerable amount of work had revealed good prospects.

Elk Lake.—At the annual meeting of the Mount Royal Cobalt Silver Mining Company it was decided not to work the property until next season. Stock will be offered in the London market. The Mount Royal owns property on Elk Lake near Elk Lake City.

It is stated that the Beacon Consolidated, working the Cleaves claims at Elk Lake, are determined to put machinery on the property this winter and carry out a considerable amount of underground development.

Porcupine.—It is stated that on the claims owned by Mr. R. T. Shillington and A. Richardson, of Haileybury, a 20-foot vein of quartz showing free gold has been uncovered. They adjoin the Connell veteran claims which have been sold to the Consolidated Goldfields of South Africa.

On the claims under option to Mr. Clem Foster, of Haileybury, work is going to recommence at once. These claims lie near the Dome, and the vein there was first discovered soon after the more famous discovery was made. It has been traced for 2,500 feet, stripped for 500 feet, and is one of the most remarkable ore bodies in the Porcupine camp. It is remarkable for its free gold showings. Two shafts of 50 feet are going to be sunk on the vein to prove it up.

The Government has now cut its road through to Porcupine and a considerable amount of traffic is being taken in on jumpers or stone boats. The heavy rains and the heavy traffic have, however, combined to make the clay trail very bad indeed.

The two Homer veteran claims purchased by Mr. Connell have been sold by him and Mr. Rea, of Chicago, to agents of the Consolidated Goldfields of South Africa. The showing is one of the most remarkable in the whole of the Porcupine camp. Little work has been accomplished on the property to date, but the purchasers are determined to discover the worth of their optioned claim at once.

There has been a brisk sale in Porcupine mining claims during the past few weeks, though the prices obtained are not

nearly as high as currently reported. Good options can be obtained if the seller is willing to take small initial payments.

The Peacock interests in the Silver Cliff Mining Company have purchased five gold properties in the western part of Nova Scotia. The properties sold are the Park and Douglas, Ballou, Nelson, Fisk and Caledonia. The properties are situated in the Molega District of Queen's County, Nova Scotia.

Kenora.—The copper property on Alley Island, Lake of the Woods, located by prospector Moore, the managing of which is in the hands of Dr. S. S. Scovil, is showing very good results up to date. The main shaft is now down over 50 feet and the ore is becoming richer. This property is one of exceptional interest, since in spite of predictions that the native copper which outcropped on the surface would give place below to copper pyrites, the ore is still showing large amounts of free copper in horns, wires, and granules in increasing quantities. The work is still being pushed forward on this property by the original holders, although there is a rumour that American interests, which already control the largest of the copper producers, are about to acquire this property.

The Mikado mine, which is under the management of R. B. Nickerson, is showing up as well or even better than was expected even from the favourable reports made by the engineer before the Kenora Mines Company began to operate. Two new drills have been put in operation on the seventh level. All the stamps are being worked to their capacity. There is a large amount of ore in sight and within a short period now the cyanide plant will be in full swing. It is clear that the confidence displayed in this mine by those citizens of this town who inaugurated the Kenora Mines, Limited, has been justified, for there is no doubt that the property is a good one and with proper management will soon take its place among the gold producers of to-day.

Work is now proceeding on Location K47 on Ziz Zag Point in Clear Water Bay, Lake of the Woods. The shaft is down about 40 feet and the showing is so good that the owners are delighted and are pushing development work as fast as possible. A contract has been let to sink 200 feet on the claim.

There have been several iron claims taken up in the neighbourhood of Dryden and the syndicate interested has been negotiating for the purchase of the 30,000 horse-power falls from the Lake of the Woods into Winnipeg River here at Kenora. The deal, however, has not yet been completed, but if it should go through, there is every possibility of the establishment here of an electrical furnace for the reduction of iron, similar to those successfully employed for such work in Sweden.

The engineer for the Lac Seul Railroad which will connect Kenora with the Grand Trunk Crossing, is on the ground getting together his party to run trial lines for this road. The operation of this road will be of considerable importance to the prospector in this district, as it opens communication between here and the Grand Trunk Pacific and by means of that railroad that district lying north of the Canadian Pacific Railway, which has only been very slightly visited by the prospector.

A new combination has taken hold of West Hawk Lake and Star Lake properties with the intention of finding the necessary capital to proceed with the development of these very promising prospects.

BRITISH COLUMBIA.

Among the topics of particular interest connected with the mining and smelting industries of the province that attracted notice during the first half of October were the annual reports of the Consolidated Mining & Smelting Company of Canada, Limited, and the Granby Consolidated Mining, Smelting & Power Company, Limited, respectively, each of which companies held its annual general meeting of shareholders—the former at the end of September, and the latter early in October. Some comment on these reports is made separately.

In Nelson mining division, much interest was taken in an investigation by the Provincial Water Commissioners into the position of a number of holders of water rights and applicants for records of water from Sheep Creek and its tributaries. The evidence adduced made plain the necessity for system and due consideration for the rights of others in dealing with applications for the right to use water, and that the Provincial Government did well, though its action in this direction was long delayed, in appointing commissioners to straighten out the water tangles and see that only bona fide users of water shall retain the right to same. The particular concern about water in Sheep Creek district has arisen in connection with the water requirements, present and prospective, of mineral claim and mine owners for use in stamp mills, of which there are several in this gold camp, and the erection of others is intended.

In the Boundary district, the recently completed enlargement of two blast furnaces at the British Columbia Copper Company's copper smeltery at Greenwood, the resumption of ore shipping from the New Dominion Copper Company's Rawhide mine, in Phoenix camp; the ore going now to the Greenwood works instead of to Boundary Falls; and the resumption of production at the No. 7 mine, which, after having been inoperative for about eight years, has been acquired and is being worked by the Consolidated Mining & Smelting Company; are noteworthy developments.

In the Coast district, the chief incident in connection with mining, was the starting of concentration operations at the Portland Canal Mining Company's newly erected concentrator, situated within a couple of miles of the mine, and near the short line of railway in course of construction by the Mackenzie & Mann interests, Toronto. A few tons of ore—less than half-a-dozen—were lately sent from other claims to the Tyee Copper Company's smeltery, Vancouver Island, for test purposes, but with this exception the Portland Canal Mining Company is the first in the Portland Canal district to turn its ore to commercial account.

Cariboo.—The secretary of the West Canadian Deep Leads, Limited, in a communication to the London Mining Journal, under date September 20, wrote: "At present we are sinking what we believe is the biggest shaft ever sunk in Cariboo in deep ground, the lead lying at a depth of 253 feet. The dimensions of the shaft are 18 feet by 6 feet, internal measurement, with three compartments, and the present depth is 120 feet." Some time since Mr. L. A. Bonner, resident manager of this company, gave the gold commissioner for Cariboo district the following information concerning this company: "The West Canadian Deep Leads Company was formed to exercise the option held by the original syndicate upon leases of claims situated on Little Valley Creek. Two cross sections were made in 1908 by means of a Keystone drill to establish the depth, gradient, and position of an assumed channel. The results of the borings made, in the opinion of the company's consulting engineer, Professor S. Herbert Cox, A.R.S.M., London, Eng., warrants the outlay necessary to sink a shaft 260 feet to bed rock, to cross-cut the channel and test for gold. Much preliminary work was necessary, particularly in the construction of a wagon road, over which to haul the somewhat heavy machinery purchased for the property. The shaft now started has two winding compartments, each 4 feet 4 inches by 6 feet in the clear, and one pumping compartment 7 feet 6 inches by 6 feet. Two 80 h.p. and one 36 h.p. boilers have been provided. Cameron sinking pumps are to be used as far as their capacity will allow, and two 18-inch Cornish pumps, driven by a cross compound Corliss engine, are to be the station pumps. Should payable dirt be encountered, a hydro-electric plant will be put in for power supply purposes. It is expected about 30 men will be employed while the work of sinking is in progress."

East Kootenay.—Fire at the Crow's Nest Pass Coal Company's slack bins, Fernie, did damage to an extent estimated at between $10,000 and $15,000. It is stated that it will be practicable to continue making coke in the adjacent ovens with little

interruption, there being alternative provision for supplying the ovens with the slack coal required for this purpose.

It is announced that work will again be done on the Estella group, situated on a mountain near Tracy and distant from Fort Steele about 15 miles, on which a considerable amount of development was done in the early nineties. Two lodes have been worked on, one showing gray copper, with copper carbonates and some galena, and the other galena. The property was examined in 1898 by the Provincial Mineralogist, who in his report mentioned having traced the galena outcropping over the hill for from 500 to 800 feet, and finding the width, as exposed on the surface, from 6 to 24 inches of almost solid galena. In his report for 1902 the District Gold Commissioner mentioned that the long tunnel was in 1,250 feet and showed in one crosscut 3 feet of clean galena with some 15 feet of concentrating ore. Lack of transportation facilities has been the cause of this property having been so long idle. Now that the construction of the Kootenay Central Railway up the valley of the Kootenay River is in progress, the prospect of transportation being thus made available has led to the Estella again receiving attention.

Ainsworth.—The long tunnel of the Highlander mine, owned by the Highlander Mill & Mining Company, of Philadelphia, Pennsylvania, is to be lengthened. The mine was examined lately by Mr. F. M. Kurie, of Philadelphia. For the report of the Canada Zinc Commission, Mr. Philip Argall, of Denver, Colorado, stated that this mine had been developed, up to the latter part of 1905, by 2,766 feet of tunnel work, 1,227 feet of drifts, and 430 feet of winzes and raises; total footage of development, 4,423 feet. The vein varies in width from about 2 to 25 feet, and may be said to average 3 feet of concentrating ore in the shoots opened on the main Highlander tunnel-horizon south drift. About 700 tons of lead concentrate and 100 tons of hand-sorted lead ore have been shipped from this mine, average metal contents having been stated at 67 per cent. lead, 4 per cent. zinc, and 22 ounces of silver per ton. The Highlander group of mineral claims aggregates in area 380 acres. In the course of his report Mr. Argall said: "The Highlander property has the appearance of having had far too much money squandered on the main tunnel, in search of elusive veins at great depth, to the neglect of the large vein, which is really a first-class prospect and deserving of thorough development." Little, if any, work has been done on this property during recent years.

Slocan.—Shipments of silver-lead concentrates from the Van Roi mine during the year have now reached a total in excess of 1,000 tons; the Richmond-Eureka group output has totalled 3,400 tons of silver-lead ore; that of the Standard about 1,300 tons; the Ellis Silver Mining Company's Eastmont mine has shipped nearly 600 tons; the Rambler-Cariboo and Ruth-Hope group each about 500 tons, and the Mollie Hughes 300 tons; while smaller shipments have been made from the Slocan Star, Idaho, Bluebird, Hewitt and several other district mines.

Nelson.—The Granite-Poorman 20-stamp mill is being kept steadily at work crushing ore from the mines of that name. Last year's tonnage was between 10,000 and 11,000 tons, so this year's, to date, may be placed at about 8,000 tons, for usually the mill is kept running with little interruption in its work. The price of copper continues too low for profitable operations at the Queen Victoria, so no ore is being sent from this mine to the smeltery just now. Mr. F. W. Guernsey is superintending work at the Molly Gibson mine, recently acquired by the Consolidated Company, and ore will be sent to Trail as soon as it can be shipped with advantage.

Ymir.—An air compressor has been received at the Ymir railway station for the Yankee Girl mine, the output of which for the year is more than 4,200 tons of gold-silver ore, shipped to Trail. The manager, Mr. H. L. Rodgers, has gone to New York to discuss with his directors a contemplated enlargement of operations and the putting in of a concentration plant, which is contemplated.

Salmo and Erie.—The tonnage of lead ore shipped from the Emerald mine, near Salmo, this year now totals more than 1,600 tons, which is 500 tons in excess of its total for the whole of 1909. Both the Arlington and Second Relief, at Erie, have been worked this year; now it is announced that the Big Bump is to have much development done and a stamp mill erected, by a Spokane syndicate.

Sheep Creek.—The Queen, Nugget, and Mother Lode mines continue to be the most active in this camp. Production figures published at Nelson show that some 16,400 tons of ore have been milled at the Queen 20-stamp mill, and 4,300 at the Nugget during nine months to October 1. Important underground development has been in progress in the Mother Lode mine all the year and it is claimed that $1,000,000 worth of ore is blocked out. Several other properties are also being prospected.

Rossland.—Outside of the important work and large production being maintained by the Consolidated Company at its Centre Star group of mines, and the steady progress of Le Roi No. 2, some activity exists. There is a probability of several of the smaller properties in this camp adding a little to the total of production. Both the I.X.L. and Bluebird are being worked, and now the Derby claim of the Spitzee Mining Company will probably be prospected. The Granby Company is developing the Cliff, with good prospects of making a regular producer of it.

Boundary.—Total output of ore from this camp for the year is now nearly 1,300,000 tons, more than two-thirds of which have come from the Granby mines. The B. C. Copper Company is gradually enlarging its operations; the output of ore from its Mother Lode mine is being increased, it is now receiving ore from the Rawhide mine, development and production at its Wellington group are in progress, the construction of a 5-mile aerial tramway from its Lone Star and Washington mines has been commenced, and the enlargement of two blast furnaces at its smeltery completed, this last improvement bringing the treatment capacity of the works up to between 2,500 and 3,000 tons of ore per diem. The Consolidated Company is sending more than 2,000 tons of ore weekly from the Snowshoe mine to Trail, and is preparing its No. 7 mine for making a regular output of ore.

Similkameen.—The Hedley Gold Mining Company has closed another quarter's operations with gratifying profit—more than twice as much as will pay the customary quarterly dividend at the rate of 12 per cent. per annum. The new plant at the 40-stamp mill will add to the gold-saving facilities, so that even better results may be expected from this forward. Efforts are being made to sell stock in the Pollock Gold Mines, Limited, a company projected to acquire and operate a group of half-a-dozen claims near Hedley, assay returns of ore from which are stated to average $17 per ton. The Osoyoos Coal Company, of Nelson, is prospecting its coal lands, in the Princeton district, and the Columbia Coal & Coke Company, of Winnipeg, is putting in a compressor and other plant, to facilitate the opening of the coal seams on its property at Granite Creek.

Yale.—Other parts of the big Yale district, beside the Boundary and Similkameen, in which more or less mining work is in progress are the Nicola Valley, Kamloops, Revelstoke, and Yale divisions. Coal mining in Nicola Valley is becoming quite an important industry, while a collection of metalliferous minerals from here was awarded first prize for a district exhibit at the Nelson annual exhibition. About Kamloops both metal claims and coal lands are being prospected, while in several instances important development work—notably at the Iron Mask mine—has been arranged for. In Revelstoke division there is little mining other than placering in the Big Bend of the Columbia country. Farther northward the mica deposits have been worked throughout the summer and 1,000 pounds of mica sheets sent out, these ranging from 6 by 8 inches upwards. Beside this, half a carload of special mica, 3 by 4 and 4 by 5 inches, was, according to the local newspaper, shipped to England. Be-

tween Hope and the International boundary line, numerous claims have been staked and recorded, and reports of finds of ore giving good assay returns have been received.

Coast.—The Britannia mine, near Howe Sound, has been shipping ore and concentrate to the smeltery at Tacoma, Washington. The further prospecting of the big occurrence of ore near Green Lake has been in progress. Mining on Vancouver Island has been restricted chiefly to coal, of which a large output is being made by the Canadian Collieries (Dunsmuir), Limited, Western Fuel Company, and Pacific Coast Coal Mines, Limited. On Lasqueti, Texada, and Valdes Islands gold-copper ores are being mined, but as yet commercial production is from mines on Texada Island only. Mining on the Queen Charlotte Islands continues to be the development of several copper properties on Moresby Island and the prospecting of coal lands on Graham Island.

In the Portland Canal district, the chief activity is on the respective properties of the Portland Canal Mining Company, Stewart, and Red Cliff. The first-named expects to shortly make its first shipment of concentrates to the smeltery; the Red Cliff is now pushing on its deep-level tunnel, now in about 1,000 feet and with 200 to 300 feet to be driven to reach the ore-shoot it is calculated is that distance ahead. The Pacific Metals Company, Limited, of Victoria, is developing the Red Wing and Red Jacket claims, on Goose Bay, Observatory Inlet, with promising results.

GENERAL MINING NEWS.

NOVA SCOTIA.

Springhill Mines, October 16.—To-day witnessed the first blood shed since the beginning of the long strike. Daniel McKay, aged 20, while on his way home, was stabbed in the back by an Italian. While McKay was receiving medical treatment at the Crescent Club rooms, another young man, George Crummie, was brought in suffering from a pistol shot in the face. The assailant of these men has not as yet been captured.

Halifax.—Cobalt interests are preparing to invest a considerable amount of money in Molega gold district. This is the third or fourth recent instance of the kind.

QUEBEC.

Quebec, October 14.—An action for $250,000 is being heard in the Superior Court before Mr. Justice Lemieux. This is a claim taken by the Bell Asbestos Mines against the King Asbestos Mines, and is based on an alleged encroachment of property.

ONTARIO.

Queensboro.—Manager S. N. Graham, of the Canadian Sulphur Ore Company, Queensboro, is making excellent progress. The main shaft is being sunk rapidly and levels are being run in good ore. Shipments will be maintained throughout the winter. The ore is remarkably high grade. As massive pyrite ore this occurrence is phenomenally pure and is in strong demand.

Madoc.—The G. H. Gillespie talc mill is running steadily. Large shipments are made weekly to Germany, Great Britain and the United States, in addition to various Canadian points.

Toronto.—An order directing the sale of the Cobalt Central property has been entered in the High Court of Justice at Toronto. The sale will be held on December 28th next at the office of the liquidator, E. R. C. Clarkson. The property comprises 240 acres. The total book value of the property is $1,926,753, of which $1,627,238 represents the value of the property and $166,053 of the prospecting and developing work done. The company is capitalized at $5,000,000 and has paid $192,485 in dividends. The stock has a par value of $1 and is now selling around 7 cents.

Toronto, October 20.—The Federal Government, it is learned, will take no action regarding the question of bounties or duties on iron and steel.

Iron and steel bounties—that is, the bounties that are paid on pig iron, puddled bars and steel ingots—will expire on the 31st of December next. The bounty paid on the manufacture of steel rods, however, will not cease until July 1st next. Payment may be made after the 30th of June on rods actually made and sold prior to that date.

The legislation regarding steel rods was passed last session at the instance of Hon. W. S. Fielding. During the discussion in committee on the bill, the question was asked of the Minister of Finance whether a duty would be imposed to take the place of the bounties.

Mr. Fielding replied: "We certainly have no such intention at present. What may come in the future, I cannot say."

Porcupine, October 20.—The Porcupine Mine Owners' Association has received details of the transaction whereby the Consolidated Goldfields Company, of South Africa, has taken over the controlling interests in the Rea Mines, Limited, of Porcupine. This company has been organized to purchase the Connell Veteran claims, a total of 320 acres, situated in the heart of the richest area of the Porcupine district.

Mr. John T. Milliken, of St. Louis, president of the Golden Cycle Company, of Cripple Creek district, of Colorado, is largely interested in this new company. Mr. Louis Webb, of Webb Bros., consulting engineers for the Consolidated Goldfields Company, reported on the Connell properties for his clients. Mr. Webb's examination was so entirely satisfactory that the deal was consummated within ten days after his return from Porcupine.

Mr. T. H. Rea stated to a representative of the Porcupine Mine Owners' Association that the necessary machinery and equipment had been ordered, that camps were being built to accommodate a large force of men and that three shafts will be sunk at once.

The most important vein on this property so far found is from fifteen to sixteen feet in width and for 200 feet carries spectacular gold values on the surface. Two shafts have already been sunk on this vein to a depth of twenty-two feet each and at this depth the values are as high as on the surface.

This is the first Canadian venture of the Consolidated Goldfields Company of South Africa.

The Milliken interests last year took over the Provincial mine at Cobalt, Ontario.

BRITISH COLUMBIA.

Nelson, October 14.—R. F. Tolmie, deputy minister of mines, with Mr. F. H. Shepherd, the chief inspector, has left for the Crow's Nest mining field to establish at Fernie the first of three government rescue-stations in connection with the operating collieries of British Columbia.

Upon the return of officials to the coast arrangements will be made for the installation of the Nanaimo and Cumberland stations. All the apparatus for three stations is now en route.

It is the intention of the mines department also to install a central station at Middlesboro in the Nicola country, to support colliery installations as required by the Coal Mines Regulation Act.

Nelson, October 25.—Le Roi mine, once banner producer of Rossland, with its smelter at Northport, is for sale. At a recent meeting in England, Mr. A. J. McMullen was appointed sale

liquidator, and is now on his way to Rossland to dispose of property. Recent diamond drilling failed to disclose any rich ore bodies, and it is considered cost of extraction and treatment of ore reserves on lower levels is too high to be profitable. Company has balance in bank and one of most complete mining plants in the country.

Victoria, B.C., October 25.—It was disclosed to-day that the action brought by Hon. James Dunsmuir against Mr. William Mackenzie for one million dollars is the second chapter in the litigation arising out of the purchase by the Canadian Collieries, Limited, of the immense coal mine interests of the Dunsmuirs on Vancouver Island. The initial step to bring the dispute into the courts was taken some time ago by W. J. Taylor, K.C., acting for the Canadian Collieries. The latter, in their statement of claim, alleged that Mr. Dunsmuir failed to keep the properties intact during the continuance of the option given to Mr. Mackenzie, but disposed of a large quantity of coal, also that the sum of $400,000, which was in the treasury of the Dunsmuir company at the time the option was taken, was later declared as dividend, and passed into the hands of Mr. Dunsmuir and his associates.

Mr. Taylor will to-morrow apply to the Judge of the Supreme Court for an order to stop the action brought by Mr. Dunsmuir against Mr. Mackenzie, on the grounds of abuse of the process of the courts, and its being vexatious to have two actions for the same cause between the same parties.

COMPANY REPORTS.

MARITIME COAL, RAILWAY AND POWER COMPANY, LIMITED.

At the regular meeting, October 20th, of the Maritime Coal, Railway and Power Company, Limited, which was held at the head offices of the company it was decided by the directors to equip the slopes at Joggins with electric coal cutters and also to install an electric plant of suitable size, not only for the present output, but for future requirements of the mine.

THIRD LA ROSE ANNUAL.

La Rose Consolidated Mines Company and controlled companies report for the fiscal year ended May 31st last, is as follows:

	1910	Changes Inc.
Gross earnings	$1,691,099	$126,031
Expenses	748,003	237,505
Net earnings	$943,096	*$111,474
Dividends paid	910,000	276,910
Surplus	$33,096	*$388,384

* Decrease.

The combined surplus of the company on May 31st last was $469,959, as against $436,863 at the beginning of the last fiscal period.

The income account of La Rose Consolidated follows: Dividends received, $909,993; dividends paid, $898,924; balance, $11,069; administration expenses, $28,995; deficit, $17,926; previous surplus, $21,707; profit and loss surplus, $3,781.

Following is a summary of shipments for the twelve months: Dry tons shipped, 6,313,905; gross ounces silver contained, 3,100,444; gross silver value, $1,620,341; average price received, per ounce, 52.261 cents; received from sales of cobalt, $29,698; gross value silver plus cobalt paid for, $1,650,039; smelter deduction, freight and treatment, $208,065; net value received from ore sales, $1,441,974.

The report shows that the total cost of producing silver during the year was $737,842, and the total marketing expense was $216,936. Mill rock treated during the year was 18,423 dry tons, and the profit on mill rock was $138,218.

The report calls attention to the fact that the company continued during the year to be one of the largest producers of silver in the Cobalt district. During the twelve months the total dividends paid were equivalent to 12 per cent. on the company's capital stock, while the combined surplus at the close of the year of the holding and operating companies was $473,741.

Attention is also called to the fact that the new management which assumed control in October a year ago, deemed it wise to reduce the dividend in order to carry on an extensive programme of development work, with a view to increasing the company's ore reserves and surplus. Ore reserves on May 31st were 5,544,449 ounces.

President D. Lorne McGibbon says that since the close of the fiscal period, ore reserves have been maintained, the available cash assets have been increased almost $200,000,and several discoveries have been made, notably the one in the Princess mine, which is very important. This vein averages about three inches in width, and assays on the average nearly 4,000 ounces per ton.

TRETHEWEY'S POSITION.

In a statement issued by the Trethewey Company on October 15th, when the dividend cheques for the 10 per cent. dividend recently declared were sent out, it is shown that on October 1st the company had cash in bank and due from smelters $207,740.74, ore sacked at mine $12,847, leaving $220,587.74. After providing for dividends and outstanding indebtedness there is a surplus of $102,759.45.

NIPISSING.

The financial condition of the Nipissing Mines Company (operating company), October 1st, 1910, was as follows:

Cash in bank	$572,038
Ore in transit and at smelters	315,141
Ore sacked at mine ready for shipment	457,422
Total	$1,344,601

BUFFALO DIVIDEND.

Buffalo Mines Company, Limited, has declared an extra dividend of 3 per cent. on the capital stock, payable November 15th. In September the regular quarterly dividend of 5 per cent. and 3 per cent. extra was declared.

AMALGAMATED COPPER.

The Amalgamated Copper Company has declared the usual quatrerly dividend of 50 cents per share. The company has now distributed $48.50 per share since organization, or a total of $66,376,364.

BRITISH COLUMBIA COPPER COMPANY EARNINGS.

The British Columbia Copper Company reports net earnings for September of $27,600, and cost of producing copper at 8.3 cents per pound.

CITY OF COBALT DIVIDEND.

At the annual meeting of the City of Cobalt Mining Company on October 15th the following statement of affairs was presented:

Detail Profit and Loss Account.

Balance profit and loss, 1909	$179,900.51
Cash from smelters	103,335.16
	$283,235.67
Royalty, T. & N. O.	$ 5,111.11
Concentrating charges	18,493.11
Freight, smelter	7,046.24
Balance	252,585.21
	$283,235.67

The cash on hand on October 1st was $36.39, while the bank showed merely $12,002.66. The other points of interest at the meeting were that it was not considered opportune at the present time to declare a dividend and the number of directors was reduced.

GRANBY CONSOLIDATED.

At the recent annual stockholders' meeting, of Granby Consolidated, Jacob Langeloth, then president and a director of the corporation, but no longer connected with the corporation in an official capacity, replied to a stockholder's question that there would be no dividend forthcoming in the near future, even though the treasury was in strong position.

Granby is now declared by an official to be in the best position in its history, physically and financially. The company never made any pretence of putting in sight an enormous ore tonnage, but since commencement of operations it has blocked out more ahead each month than was extracted in the same period. The much-talked-of Sussman report on the property did not by any means cover the entire territory. For instance, between the main working property and the Gold Drop mine there is an expanse of fully a mile, somewhat wooded, and known by the management to be mineralized. Dr. Sussman did not take this into account.

When Mr. Langeloth and his associates entered Granby they did it on the recommendation of the same Dr. Sussman, who made the recent report. Their interest, conceded to be the largest individual one, averaged to cost $40 a share on the basis of the present par value of $100.

It will not be long before the entire Granby battery of eight furnaces will be in operation; the capacity of the smelter is 4,500 tons daily. Last year there was treated but little over 1,000,000 tons, whereas 1,800,000 tons could have been put through the plant after completion of all enlargements. This excess capacity will be used for whatever custom business can be secured. There is a great custom field in the Boundary district. It is a vast mineralized territory containing low-grade ores and with a little encouragement small owners and leasers could be induced to mine and ship to a friendly smelter, where there was probability of a profit.

Granby does not owe a dollar, and aside from its mine and plant, has a valuable asset in its large block of Crow's Nest Pass Coal Company, which not only pays a dividend return on the investment, but also insures an ample fuel supply. The water power property, yet in an undeveloped stage, will probably during the next year or two be given attention and put on an operating basis. Transportation facilities with both the Canadian Pacific and Great Northern railroads running up to the ore bins, could not be better. Rates have been scaled during the past few years very heavily.

As to whether the average contents of the ore treated can be improved over the figures indicated from last year's operations—between 18 and 19 pounds of copper per ton—is a question for the future to decide.

CROWN RESERVE.

The general manager of Crown Reserve Mining Company reports to his directors for nine months ending September 30th, 1910, as follows:

The most important development during this period has been the discovery of Vein No. 28 at the 200-foot level, 890 feet east of No. 1 cross-cut; this is probably one of the veins that we cut with the diamond drill. When cut this vein showed from six to eight inches of heavy smaltite ore carrying some silver, also two calcite veins rich in silver, running almost parallel to it, and about two feet away. We have drifted on this vein for about 150 feet in continuous ore, but of erratic values. We have had assays from the six inches of smaltite that have gone over four thousand ounces, but the average assay is probably about one thousand ounces. This vein, however, is just at the contact between the Keewatin and the conglomerate, and we hope to find richer values in the finer conglomerates above as was our experience with veins Nos. 17 and 24.

Victoria Vein.—We have proved up this vein for a distance of 120 feet, the ore being from two to five inches in width and will average about four thousand ounces. We have a winze down twenty feet below the 100-foot level in continuous rich ore.

Carson Vein.—We have during the past nine months only extracted ten tons of ore from the big stope at the 100-foot level, having done most of our work in the stope at the 200-foot level all in rich ore. We are now getting into the conglomerates in this stope, the vein running 10 to 12 inches wide and assaying four thousand ounces.

Veins Nos. 17 and 24.—We have continued stoping on both these veins each being two inches in width and running about 4,000 ounces.

Vein No. 2.—The important development on this vein was the discovery of a bonanza shoot of ore running six inches in width and averaging over six thousand ounces for a length of forty-five feet. This ore was discovered in stoping about fifteen feet above the 100-foot level.

Veins Nos. 3, 4 and 12.—We have drifted on these veins, all of which have shown continuous ore, about two inches in width and averaging five hundred ounces.

Total Development.

	Quarter Year Feet	Half Year Feet	This Year Feet	To Date Feet
Sinking and raising	175	249	424	1129
Drifting	419	610	1029	2854
Cross-cutting	102	1058	1160	3562
	696	1917	2613	7545

During the last three months we have installed in our ore house Richard's jigs to handle a finer product than the old Hartz jig and are concentrating the screenings on a Wilfley table. This means a saving to the company of one hundred dollars net a day in freight and treatment charges.

Our main shaft is now through to the 300-foot level, after putting in the required timbers we will start sinking winzes from the 300-foot level with the object of proving up the Keewatin formation for at least 300 feet and which will give us a depth of 600 feet.

It is also our intention during the next quarter to raise No. 28 vein, so as to continue our No. 22 cross-cut to our eastern boundary line and to drift on some of our smaller veins.

The financial report is as follows:

We shipped during that period 77 cars of ore, 23 cars being high grade and 54 being low grade, of a total net value of	$1,146,203.96
Bank interest	4,100.00
	$1,150,303.96

Our operating expenses for the same period, including a large amount of development work, were		184,128.21
		$966,175.75
Less royalty to the Ontario Government for the same period		108,889.37
Showing a net profit on our operations for the nine months of		857,286.38

Out of this amount dividends have been paid as follows:

No. 8, paid 15th April, 1910	$265,322.10	
No. 9, paid 15th July, 1910	265,322.10	
No. 10, payable 15th October, 1910	265,322.10	
		795,966.30
Leaving a balance which will further strengthen our substantial surplus of		$61,320.08
Surplus, December 31st, 1909		$549,275.42
Surplus as above		61,320.08
Surplus at 30th September, 1910		$610,595.50

STATISTICS AND RETURNS

BUFFALO'S SEPTEMBER RUN.

The mill report for the Buffalo mines for September reads: Mill run, 556 hours; ore milled, 3,718 tons; average assay per ton before milling, 28.35 ounces; ounces of silver recovered, 82,639. Milling expenses—Labour, $3,450.23; power, $1,414.43. Ounces of silver paid for during month (shipped previously), $120,695. No estimates are made of high-grade ore, but returns are included under "ounces of silver paid for," as smelters make settlement. Silver quotation of October 1st, 1910, per ounce, 54⅛ cents.

GOLD OUTPUT OF THE RAND.

The output of gold at the Rand for September was 646,899 fine ounces, valued at £2,747,853.

BRITISH COLUMBIA LEAD RETURNS.

The report made by the Trail smelter to G. O. Buchanan, Dominion lead bounty commissioner, on the amount of lead ores and lead contents received during the month of September contains the names of a number of properties which have not previously shipped for some months and several which have not been on the list for over a year. Among these are the Enterprise, the Fidelity, the Hewitt and the Standard.

The report shows a considerable increase over the former months of the present year and is an indication of the changes which have taken place in the mining situation in this part of British Columbia during the past summer months. It will be seen that the percentage of lead in the ores varies from as low as an eighth of one per cent. to as high as 70 per cent. An interesting feature of the past month's report is that for the first time in many years the St. Eugene takes second place in the totals of lead ore sent to Trail. The Sullivan heads the list with approximately 3,600 short tons. The figures in the following report represent pounds:

Mine	Weight.	Lead.
Bluebird (Rossland)	48,667	2,095
Bismark	34,623	1,731
Emerald	344,484	122,326
Enterprise	46,165	15,142
Eastmount	135,668	18,092
Ferguson	56,769	11,524

Total	11,848,307	3,035,884

BRITISH COLUMBIA ORE SHIPMENTS.

The Rossland ore shipments for the year to date, including the estimated amount milled by LeRoi No. 2, pass the 200,000 mark in tonnage this week.

The following are the returns of the ore production and movement for the week ended October 15th, and also for the year to date:

Boundary Shipments.

Granby	13,646	896,534
Mother Lode	9,503	276,163
Snowshoe	2,131	119,192
Jack Pot	329	10,470
Rawhide	2,800	6,700
Other mines	.....	9,523
Total	28,409	1,318,582

Rossland Shipments.

Centre Star	3,730	150,681
LeRoi, No. 2	557	24,990
LeRoi No. 2, milled	300	12,300
Nickle Plate	67	609
Other mines	.....	12,172
Total	4,654	200,752

Slocan-Kootenay Shipments.

Greenwood, B.C.

St. Eugene, milled	2,775	113,775
Van Roi, milled	800	32,800
Queen, milled	420	17,220
Granite-Poorman, milled	250	10,250
Nugget, milled	110	4,510
Highland, milled	450	7,600
Wilcox, milled	75	600
Richmond-Eureka	59	3,371
Yankee Girl	85	4,252
Molly Hughes	34	326
Sullivan	838	15,912
No. Seven	31	104
Other mines	.....	36,400
Total	5,927	247,120

The total shipments for the week, including the estimated amount milled, were 38,990 tons, and for the year to date, 1,766,454 tons.

British Columbia Copper Company's Receipts.

Greenwood, B.C.

Mother Lode	9,503	276,163

Total	7,753	366,324

The total receipts at the smelters for the week, including concentrates, were 34,031 tons, and for the year to date, 1,565,650 tons.

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending October 22nd, and those from January 1st, 1910, to date:

	Oct. 22. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	.....	226,217
Buffalo	52,430	1,949,428
City of Cobalt	.....	348,875
Chambers-Ferland	.....	1,463,900
Cobalt Central	.....	293,286
Cobalt Lake	.....	300,900
Cobalt Townsite	64,000	518,840
Colonial	.....	245,580
Coniagas	62,540	1,623,976
Crown Reserve	.....	5,117,900
Drummond	.....	664,200
Hargraves	42,300	443,470
Hudson Bay	.....	417,925
Kerr Lake	387,700	8,598,324
King Edward	.....	263,406
La Rose	184,740	9,085,271
McKinley-Darragh	174,510	3,345,599
Nipissing	309,310	10,288,937
O'Brien	.....	987,216
Peterson Lake	.....	432,420
Provincial	.....	65,000
Right of Way	62,270	1,470,327
Rochester	.....	60,750
Silver Cliff	.....	268,720
Standard Cobalt	.....	258,951
Temiskaming	141,870	1,913,350
Trethewey	.....	808,580
Waldman	.....	63,992
Wyandoh	.....	48,300

Ore shipments for the week ending October 22nd were 1,481,670 pounds, or 740 tons.

Total shipments from January 1st to October 22nd were 51,773,650 pounds, or 25,886 tons.

Shipments of ore from Cobalt camp for week ended October 15th were 10,229,000 pounds, or 511½ tons, divided among nine mines. Shipments for the year to date now total 50,291,980 pounds, or 25,145 tons. Shipments for the week and year (in pounds of ore) are:

	Week ended Oct. 15.	Year.
Beaver	.....	276,217
Buffalo	57,270	1,896,998
City of Cobalt	.....	548,875
Chambers-Ferland	64,000	1,463,900

Ore Shipments

We take personal charge of your shipments to the Atlantic Seaboard, attend to the weighing, sampling, assaying and all other details

We have been successful because we furnish our clients with returns quicker than our competitors.

Consign your shipments to us and rest assured you will get the maximum returns.

International High Speed Steel Co. of New York

CARRY IN STOCK AT COBALT, ONT., WAREHOUSE, all kinds of DRILL STEEL in Octagon and Cruciform.

For price and all information write to our Cobalt office, P. O. Box 370.

Our Steel is made in Sweden from best Swedish Ores and is even in grade.

Want Advt.

Mining Engineer, technical graduate wants position with Coal Co. in Western Canada. Experienced Surveyor, Assayer and Draftsman. Unmarried, age 26. Low initial salary, no objection if chances are good.

Address, Box 653,
Oshawa, Ont.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price,

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE FOLLOWING GEOLOGICAL MAPS HAVE BEEN RECENTLY ISSUED:—

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1025. Waverley Sheet. Scale 1 mile to 1 inch.
1037. Windsor Sheet. Scale 1 mile to 1 inch.

QUEBEC

1079. Geological and Topographical Map of St. Bruno Mountain, Chambly Co., Que. Scale 800 ft. to 1 inch.

ONTARIO

1076. Gowganda Mining Division. Scale 1 mile to 1 inch.
1061. Explored routes in a portion of North Western Ontario, traversed by the National Transcontinental railway between Lake Minnitaki and Lake of the Woods. Scale 4 miles to 1 inch.

ALBERTA

1032. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland. Scale 400 feet to 1 inch.
1004. Geological Sheet, Rossland Mining District. Scale 1200 feet to 1 inch.
1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1105. Map No. 4A. Geological—Golden Zone Mining Camp near Hedley, B.C., by C. Camsell. Scale 600 feet to 1 inch.
1106. Map No. 3A, Geological—Mining Claims on Henry Creek near Hedley, B.C., by C. Camsell. Scale 800 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1041. Geological Map Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of the ore bodies of the same belt.
1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.
973. Catalogue of Canadian Birds, by John Macoun and James M. Macoun.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotland Part I, Economics, Part II Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon and Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
980. Report on a portion of Algoma and Thunder Bay Districts, by W. J. Wilson, and on the region lying north of Lake Superior between the Pie and the Nipigon Rivers, by W. H. Collins. A map showing the geology along the water courses from Lake Superior to the Albany River and from Missinabi to Nipigon River accompanies the report.
1082. Memoir No. 6. Geology of the Haliburton and Bancroft Areas, Ontario, by Frank D. Adams and Alfred E. Barlow.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.

YUKON and NORTH WEST TERRITORIES

1050. Whitehorse Copper Belt, accompanied by maps, by R. G. McConnell.
1097. A Reconnaissance across the McKenzie Mountains on the Pelly, Ross and Gravel Rivers, Yukon and North West Territories, with map, by Joseph Keele.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Book Dept. CANADIAN MINING JOURNAL, *Confederation Life Building* TORONTO

Geology Applied to Mining

By Josiah Edward Spurr, A.M.

Mining men, prospectors, investors and students have found this book a treasure house. It is a plain, simple, straightforward application of economic geology to mining problems. It is a concise summary of the principles of ore deposits for the man who wishes to exploit them. It isn't *geology*, but *geology as applied to practical mining.* It boils down the abstract science for the practical mining man and student—the processes of deposits, the arrangement of stratified rocks, igneous rocks, structures, placers, chemical geology, etc., etc.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

Westinghouse Motors
For Driving Pumps

You Do Not Have to Watch Westinghouse Motor-Driven Pumps

They practically run themselves. For intermittent service the motor may be automatically started and stopped by means of pressure regulator, or by variation in height of water. The consumption of power is thereby regulated by the actual work being done.—A Westinghouse Motor is much simpler than any form of engine; it is always ready for instant service; it has no reciprocating parts; no pistons to wear and require packing; no dirt, exhaust steam or vibration to contend with. The bearings are self-oiling and require only an occasional inspection and renewal of oil.

Send for Circular No. 1512

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

ON TIME

One of the most important business transactions which sensible minded men should perform on time is that of making proper provision for those who are dependent on them for the necessities of life.

The only way to do this is by means of life insurance. The only way to do it on time is to act now while in health. The most satisfactory way is to insure at once in the

"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just becanse it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be the stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we know, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs per year than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line, As you have everything to gain and nothing to lose, why not investigate NOW?

BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

ROCK DRILL EFFICIENCY

Rock Drill Efficiency is measured by the length of time the drill stays on the job doing good work, standing up to its original capacity without breakage delays.

MATERIALS—The most carefully selected materials are used in the manufacture of **"Rand Drills."** Vital cast parts are made of high-grade open-hearth steel castings and steel parts are made of the finest steel, each selected to perform its particular function in the operation of the machine. Special treatment of steel parts insure the utmost service from each part.

WORKMANSHIP—Rand Drills are built by mechanics who are experts in their line, with years of experience and every facility and incentive for the best work, in a shop equipped with every modern convenience.

We Recommend Our Pumps For Mine Work

¶ They are simple, compact, durable and built with few parts.

¶ Anyone can operate them, they require little room, can stand the heaviest work, will not clog up and are readily over-hauled for cleaning or repairs.

¶ They are built in sizes up to 14" discharge opening. In Vertical or Horizontal Types, for dry or wet Pit work, and can be operated with any kind of drive—Belt, Motor or Engine.

We will be glad to forward descriptive Bulletin.

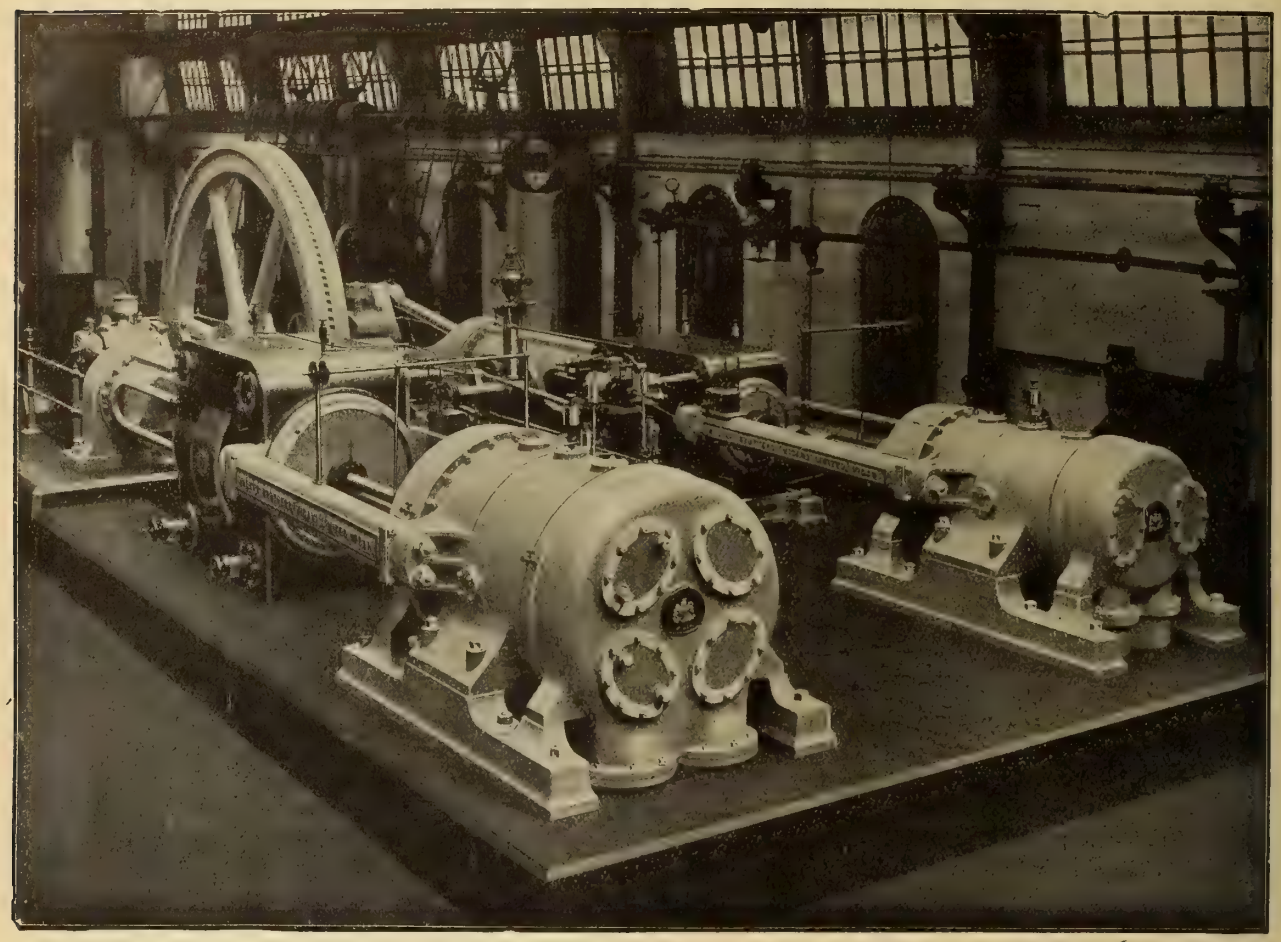
CYANIDE HANDBOOK BY J. E. Clennell

Over 500 pages, 6x9, illustrated, $5.00 (21s) net, postpaid



Mr. Clennell has been in close touch with the rapid developments of cyaniding. He has been instrumental, too, in many important discoveries, and his work in this field has taken him to the leading plants of the world. It deals generally with Cyanide and does not confine itself to the process alone. It is divided into nine main parts covering the subject more fully and exactly than it has heretofore been handled.

Especially noteworthy is the full treatment of recent developments and important phases heretofore *inadequately treated.*

The South African School of Mines and Technology, Johannesburg.

Owing to the present Principal and Professor of Mining of The South African School of Mines and Technology having been appointed Consulting Engineer to one of the Witwatersrand Minning Houses, the Council invites applications for the joint position, or alternatively for the chair of Mining alone. The salary attached to the chair of Mining is £1500 per annum. This would be increased by £250 per annum if the Professor were also appointed Principal of the School.

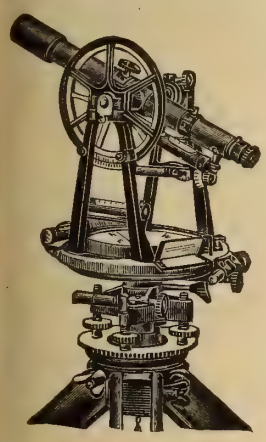
Particulars with regard to the School and the vacant posts may be obtained on application to:—

The Registrar, McGill College and University,

Montreal, Canada.

Applications must be sent so as to arrive in Johannesburg not later than the 30th November, 1910. They should be addressed to :—

THE SECRETARY,
P. O. Box 1176,
Johannesburg.



Geology Applied to Mining

By Josiah Edward Spurr, A.M.

Mining men, prospectors, investors and students have found this book a treasure house. It is a plain, simple, straightforward application of economic geology to mining problems. It is a concise summary of the principles of ore deposits for the man who wishes to exploit them. It isn't *geology*, but *geology as applied to practical mining*. It boils down the abstract science for the practical mining man and student—the processes of deposits, the arrangement of stratified rocks, igneous rocks, structures, placers, chemical geology, etc., etc.

RECIPROCITY IN COAL.

A pamphlet entitled "Memoranda Respecting Reciprocity in Coal," has been issued conjointly by nine coal companies operating in Nova Scotia. It comprises a memorandum submitted to the Government of Nova Scotia by all nine companies; a memorandum submitted to the Federal Minister of Finance by the Dominion Coal Company, Limited; a letter written by the Nova Scotia Steel & Coal Company, Limited, to the Minister; similar letters from the Acadia Coal Company, Limited, and the International Coal Mining Company, Limited; and, in conclusion, a characteristic paper by the Hon. Robert Drummond.

Time was when the coal operators of Nova Scotia were popularly looked upon as bold, bad barons. And they did little to discourage this view. Now, however, times have changed, and the mine owners recognize the final importance of engaging public sympathy by a full and open statement of their case.

That case can be set forth in a few paragraphs.

The main contentions of the operators are, in effect, that reciprocity in coal will assuredly throw out of employment between 17,000 and 20,000 men and boys, who, with their families, are directly dependent upon coal mining; and, further, that a much larger number of persons will be indirectly affected. This, if we may accept as facts the statements of the operators, is an obvious proposition. How they substantiate their assertions we shall see later.

Other arguments against reciprocity are that, since the sum of $50,000,000 is invested in Nova Scotian coal mines, and since this is preponderatingly Canadian money, and, also, since some millions of dollars have been spent in providing transportation and dockage facilities for the present channels of trade, therefore any re-adjustment of markets would be disastrous. This argument is supported by the fact that the trade with New England ports is constantly decreasing. Moreover, it is pointed out that the United States operator is able, even now, against a heavy duty, to seize an ever-increasing proportion of the St. Lawrence and Quebec trade.

But possibly the most cogent argument of all is the flat assertion that the removal of duties guarantees no reduction in price. In fact, if we may accept the arguments of those opposed to reciprocity, it means merely that Quebec and Eastern Ontario will place themselves at the mercy of United States producers who may at any time cease dumping into Canada when they happen to find a more profitable market elsewhere. It were superfluous here to enter into particulars. It is sufficient to state that there is little chance of Nova Scotia securing

a footing in the New England markets. Nova Scotia's shipments to the United States are constantly diminishing. The recently enacted legislation as to smoke nuisance tends to complete the United States control of these manufacturing centres. Moreover, Nova Scotia cannot compete except in rare instances with the cheaper labour, the more perfect transportation, and the immensely larger organizations that characterize coal mining in the States.

Over and above all these considerations, one fact obtrudes itself. Even if it be costlier at present, and this is a matter of debate, it is demonstrably wiser for Eastern Canada to be self-sufficient as regards coal supplies. A terminable arrangement with a much richer and more powerful nation is decidedly dangerous. We can be afforded no guarantee as to the continuity or as to the prices of coal supplies from the south. Is it not distinctly more advisable to depend upon our own developed resources? How can we safely place hostages in the hands of our commercial rivals?

This, however, is obviously presenting one side of the case. Western coal operators are as ardent for reciprocity as eastern operators are against. The case for the West must not be overlooked. It is quite distinct from the East in principle. But in practice, the same factors obtain, though positions are reversed. The West keenly desires reciprocity. Western operators believe firmly that their future depends upon free access to United States markets. This belief may be modified by the speedy development of local demand, but the physical advantages of West Canadian collieries are such that free trade means expansion.

Looking at the question from a broad viewpoint, it is evident that there is danger of emphasizing special interests at the expense of the country generally. It would be interesting to learn why Nova Scotian collieries could not hold the St. Lawrence market if the present duty were removed. Water carriage, loading and trans-shipping facilities, and established markets are a few of the advatnage that cannot be created rapidly. It is hard to see, therefore, that this heavy part of the market would be lost to Nova Scotia were the present duty to be removed. Neither does it seem probable that the Maritime Province market could not be held. In fact, there seems to be something radically wrong in the contention that Nova Scotian coal cannot on its own merits compete with the United States product. This point needs further explication.

With the statement that a fair share of trade with the United States is not obtainable we are entirely in accord. The position of American collieries is too commanding to encourage intrusion. On the other hand, the assertion that the present duty is the only safeguard against ruinous competition is going too far. Doubtless Nova Scotia would suffer loss were reciprocity to become an established fact. But the probable extent of that loss has been greatly exaggerated.

Western operators have much to gain through free trade in coal. Eastern operators have something to lose. The country as a whole may secure slightly cheaper fuel. Just how far lower prices will obtain can only be guessed. But, judging by past history, it is safe to bet that the reduction in prices will be considerably less than the amount of the duty.

It is well to give respectful attention to such documents as that under consideration. It is well also to keep ever before one's mind the fact that special interests are pleading. It is our deliberate opinion that were our economic conditions sound we would have little to fear from free trade in coal. As it is, the whole problem cannot be dismissed lightly. The situation is by no means a simple one. One of the first requisites is a plain statement of facts and a clear presentation of comparative costs and profits. Such work could well be taken up by the Canadian Mining Institute.

We cannot fairly accept the pamphlet issued by the Nova Scotian operators as conclusive. More facts are needed. Meanwhile, we may take it for granted that there are two sides to the problem. The burden of proof is distinctly on the East.

THE LORD'S DAY ALLIANCE AND THE MINING INDUSTRY.

The institutional church of to-day is the conserver of much good. The efforts of religious societies, and the work of certain non-denominational bodies are manifestations of an earnest desire to cleanse the body politic. But there is something profoundly irritating in the misdirected zeal of that inept aggregation known as the Lord's Day Alliance.

This association has with unbridled vigour fought the insidious Sunday ice-ceram. It has sought, not without success, to suppress such unspeakable sins as bathing on Sunday. In fact, its prime aim is to impose upon all of us the joyless Sabbatical traditions of the Puritan.

In Nova Scotia, in Ontario, and in British Columbia, mining men have suffered from the interference of agents of the Alliance. The latest instance comes from Cobalt, where the Alliance sought to close all concentrating mills at midnight on Saturday, instead of at seven o'clock on Sunday morning. Incidentally, this could do no good to the workmen, and would inflict loss on both employers and employees. Such a consideration does not in the least deter the Alliance.

There is humour in the situation. The Alliance no doubt is honestly convinced that Sunday ice-cream, and Saturday night-work are sapping our national health. But it overlooks certain diseased conditions that may not fall far short of both these horrid crimes. For instance, new mining camps are usually infested with women of ill-repute and with purveyors of unspeakably bad liquor. These cater to a small but reckless part of the community. To the majority of operators and workmen they are unwelcome. We have yet to hear of the

Lord's Day Alliance helping a new mining camp to remove the human carrion that so often soils its skirts. That task is left to public spirited citizens.

Were it worth while, which it distinctly is not, we could point out to the Alliance several channels in which it might forget about ice-cream. We fear, however, that the gentlemen in charge of its vagaries are too detached from real life to grasp the most significant hint. But we most humbly request them to ponder long before they interfere with men who have the good of the nation quite as much at heart as has the Alliance, and whose only fault is that they must continue to be controlled by common sense.

PORCUPINE AT PRESENT.

Porcupine is in a transition stage. Snow has fallen. The rivers and lakes will soon be frozen strongly enough to warrant heavy traffic. Navigation has already ceased. And now, with local transportation charges reduced to a reasonable figure, machinery and supplies can be rushed in as required.

But the snow brings with it not only relief to the operators, but also that type of promoter that can be denominated the "snow-bird." He it is who, availing himself of Canada's winter mantle, becomes the centre of flurries in shares—shares whose value evaporates with the spring sun. The "snow-bird" is always in season and should be shot on sight.

. . . . . .

Our remarks in our last issue on Ontario's duty to Porcupine were based upon the fact that the present Government has reaped a rich harvest from the northland. The auction sales of Cobalt Lake and other properties, and the imposition of royalties have swelled the provincial exchequer. The Government cannot confine itself to the passive role of receiver. It has invited the public to take chances; it cannot refuse to take a few chances itself. The rule works both ways. Hence it is obligatory upon the Government to support and assist Porcupine operators in all legitimate ways. The most important need at present is for postal, railway, and telegraphic communication. The spring will bring other needs.

. . . . . .

In the wake of every successful enterprise in Porcupine will follow a number of doubtful or worthless projects. This is a law of human nature. Sometimes unwisdom, sometimes crookedness is the prevailing factor. For the interested outsider it should be easy to distinguish between spurious and genuine publicity. Advertisement seldom is indicative of merit.

. . . . . .

Beside the multitudinous optioning and giving in options; the vast volume of hotel talk; the hurrying and scurrying of purchasers, and go-betweens, and vendors; there is solid thoughtful work being done in Porcupine. Never before has an Ontario field offered so much professional employment to reputable engineers. Never before have cautious investors shown such willingness to put money promptly into a Canadian mining camp. Thus a strong backbone has been created at the stage when it is most needed.

. . . . . .

Over and above the expenditure in development and equipment, other large projects are on foot. Certain of the most enterprising operators, the Timmins—McMartin—Dunlap group, are providing for the development and distribution of hydro-electric power. Private capital is tackling railway construction, though in a somewhat farcical manner. Machinery companies are making strong efforts to place equipment. Supply houses in Toronto even now feel the benefit of Porcupine money. The telegraph companies are in clover and hotels are doing a rushing business.

. . . . . .

Ore treatment has been the subject of much experiment. On one large property it has been practically decided to cut out concentration, and to cyanide direct after the stamps. Here much of the schist is heavily impregnated with sulphides. On others where the ore is relatively free from sulphides, concentration will probably be part of the flow-sheet. Fully one hunderd and fifty stamps are being or are about to be ordered. This number will be multiplied indefinitely in the near future.

. . . . . .

As in Goldfields, Nevada, so in Porcupine, the disintegrated material affords the best panning. In the early days of Goldfield the gold pan was not a usual part of the prospector's outfit. In Porcupine the pan is perhaps too much in evidence. Except in experienced hands it is misleading. At best it gives but a qualitation idea of the gold content.

. . . . . .

Numerous transactions are under way and are being closed or dropped every day. The nomadic engineer, the speculator, the adventurer, the ubiquitous newspaper correspondent are all in evidence. Everyone is taking a turn at option-mongering. Money is being spent feverishly—especially by the lesser fry. Possibly a boom is impending. We hope not. In any case, much of the interest that is now aroused is distinctly susceptible of good use. Clean publicity never does harm. Exaggeration never does good.

. . . . . .

Porcupine means much to mining in general. Its successful exploitation will set capital flowing in all directions and will create additional capital. We intend to make every effort to keep our readers informed as to its progress. This does not imply neglect of other districts. On the contrary, it will do good all round.

GOLD IN QUEBEC.

One of the first authentic discoveries of gold in the Province of Quebec was made by a young girl, Claudine Gilbert, in 1834. She came upon a nugget of gold as

large as a pigeon's egg at a spot near the junction of the Gilbert and Chaudiere rivers. For many years after that the Chaudiere Valley was the scene of occasional activity. Amongst the most active investigators was Dr. James Douglas, now of New York.

In 1866, another large nugget was found on the Gilbert River, on lot 16 of the DeLery Concession. It weighed 45 ounces, 12 dwt., and was valued at $851.26. It is now in the museum of the Geological Survey, Ottawa. The St. Onge nugget, also found on the Gilbert River, in 1877, weighed 42 ounces and is valued at $756. The Geological Survey secured this. A collection of smaller nuggets from the same locality is in the same keeping.

The only fairly reliable estimate of gold won, both by milling and washing, from the Chaudiere Valley districts, from the first discovery up to about twenty years ago, was compiled by Mr. J. Obalski. He places the total at about $2,000,000. It would seem possible that at least as much more could be obtained by modern methods.

We shall have more to say on the subject in our next issue.

PHOTOGRAPHY.

One of the most neglected of arts is photography. At least it is misunderstood and neglected by the mining engineer. A camera is looked upon as a mechanical contraption with which aim is taken as with a rifle. The photographer is content if a few good shots occur in a multitude of poor ones.

The University of McGill, recognizing the value of photography to the engineer, has begun a course of instruction in the use of the camera. In other countries this has long been part of the curriculum. McGill is, we believe, the first Canadian educational institution to move in this direction.

EDITORIAL NOTES.

Sheep Creek (B.C.) mining properties are changing hands rapidly. The Nugget mine, for which $40,000 was paid, is now being operated by its new owners. Mr. John MacMartin, of Cobalt fame, will soon have completed payments on the Mother Lode mine. A consolidated plant is proposed for four adjacent mines.

The annual report of the Department of the Interior for the year ending March 31st, 1910, gives the receipts on account of Dominion Lands Revenue as $3,007,390.82. On this sum refunds amounted to $121,391.15. Hence the net receipts were $2,885,999.67. Of the amount the items such as sales of coal lands, mining fees and leases, etc., totalled $453,342.60. In other words, the revenue from mining lands and operations amounted to more than 15 per cent. of the total.

CORRESPONDENCE.

Quebec, November 8th, 1910.

To the Editor CANADIAN MINING JOURNAL:

Sir,—In such a letter as Mr. Jennison's, published in your issue of November 1st, re my notes on "Some Manganese ore-deposits of the Maritime Provinces," the underlying current of spite and disappointment is too thinly veiled to mislead your readers.

When I was in Nova Scotia last autumn, I met Mr. Jennison, and at that time, this gentleman stated to me that it was rather unfortunate that I had been given this work, as it was his intention to offer a continuance of his services to the Mines Branch, to take up the subject of Manganese as soon as he got through with his investigations on the gypsum deposits. Enquiry at the Mines Branch elicited the fact that he has not been given the work.

Mr. Jennison states that my field work consisted in obtaining information from local farmers and lumbermen, and of casual glances at a few abandoned mines; he also implies that, had I to rely on my reputation for a living, I would soon starve to death. While your columns are always very hospitable, Mr. Editor, don't you think that it would at times save a great deal of useless unpleasantness and ill-feeling if, before publishing such uncalled-for and idle statements, you exercised your well-known diplomatic tact in advising your correspondents to round off the angles and asperities, and to polish the roughnesses of such letters as Mr. Jennison's?

It would be a waste of time and of space to take up seriatim the various points of your Truro correspondent's letter. I consider my unpretentious and honest notes, as published in the summary report of the Mines Branch, a sufficient answer to his misrepresentations of them.

Yours very sincerely,

THEO C. DENIS.

Cobalt has, up to date, paid $17,500,000 in dividends.

There are about 4,000 shareholders in the Calumet and Hecla Copper Company.

At the mill of the Miami Copper Company, Globe, Ariz., there are 48 Deister concentrating tables installed. The Deister slimers are on the ground and will soon be put in place.

Mr. S. S. Fowler has leased the Enterprise mine, near Slocan Lake, from the English owners. Though once a large shipper, the Enterprise has not been worked since 1905. Smelter returns showed at one time 150 ounces of silver.

The Buffalo mill, Cobalt, is doing satisfactory work. According to the returns for August, ore amounting to 3,303 tons was put through. This contained 41.39 ounces of silver per ton, an aggregate of 136,711 ounces. Of this amount the total recovery was 113,204 ounces or 82.8 per cent.

GRANBY COMPANY ENLARGING ITS FIELD OF OPERATIONS

(By E. Jacobs, Victoria, B.C.)

From Spokane, Washington, has been received information concerning an intended early enlargement of its field of mining operations by the Granby Consolidated Mining, Smelting & Power Company, Limited. As Mr. Jay P. Graves, vice-president and general manager of the Granby Company, has his headquarters in Spokane, and, further, as it has been known to me for several months that the Hidden Creek Copper Company's mine was under offer to the Granby Company, I am assuming that the following statement, received from a publicity agent resident in Spokane, gives a generally correct outline of the transaction under notice. The statement is, in part, as under:

"Eighty per cent. of the capital stock of the Hidden Creek Copper Company, which owns the largest copper deposit in northern British Columbia, was acquired for $400,000 by the Granby Company in Spokane on October 25th, when the deal was closed and a substantial payment made to J. M. Hodgens and Ralph Hodgens, of Butte and New York. M. K. Rodgers, manager of the property, who owns the remaining 20 per cent. of the stock, refused to sell his interest. Mr. Jay P. Graves announced that a matting plant will be erected as soon as sufficient tonnage is developed, and added:

" 'It is our intention to reduce the ore to a low-grade matte, say 20 or 30 per cent. copper, and to ship the matte to Grand Forks, B.C., to be smelted and converted there in conjunction with our Phoenix ore. By so doing we expect to cheapen our cost of operation, through increased tonnage, and at the same time reduce our metal losses in the slag owing to the larger percentage of iron in the charge. The increase in sulphur will enable us to reduce the percentage of coke consumed. The addition of this matte to our smelter charge also will admit of our treating a larger quantity of silicious ore than we can do at present.

" 'We feel confident that in acquiring the Hidden Creek mine we have secured one of the greatest copper mines on the Pacific coast. The main ore body appears to be fully 100 feet wide and, allowing for the considerable mass of low grade ore it contains, we feel we are conservative in placing the copper content at the low average of 3 1-2 per cent. In area the property is nearly as large as that of the Granby mines at Phoenix.' "

The remainder of the Spokane communication is descriptive of the property but since it was visited by Mr. Herbert Carmichael, provincial assayer, in 1909, and his account of it was included in an official bulletin published by the British Columbia Bureau of Mines, it will, perhaps, be better to quote from that publication, which thus deals with Observatory Inlet:

Observatory Inlet.

"Observatory Inlet is a branch of Portland Inlet running practically parallel with Portland Canal but 15 or 20 miles apart. Thirty-five miles from the entrance, Observatory Inlet splits into two arms, namely, Hastings and Alice Arms, the former heading north and south and the latter east and west. Goose Bay is a large sheltered inlet, the outlet being on the west shore of Observatory Inlet, at the entrance to Hastings Arm. While there is a deep waterway of ample width, no detailed survey has been made of these waters and the chart should be used with caution.

Hidden Creek Copper Company.

"This company owns nine mineral claims in the neighbourhood of Goose Bay, namely, Rudge, Revenge, Donald, Alpha, Manson, McKinley, Kenneth, Salamander, and Bunker. The principal work has been done on the Alpha and Revenge. There is an excellent plank road two miles long extending from the deep water at Goose Bay to the main tunnel, which is 530 feet above sea level.

"Prospectors were first attracted by a round-topped hill, about 1,000 feet high, which was more or less covered by a typical 'gossan' or iron cap. Prospecting showed that this gossan was thicker and more strongly marked in some places than in others, and attention was specially directed to these points. The first of this work was done on a large exposure of these oxidized ores, which proved to be 5 feet thick. This gossan was cut with a number of trenches which disclosed a body of mixed pyrite and chalcopyrite ore, and this was prospected by four tunnels, aggregating 200 feet. These tunnels developed a large body of ore carrying 4 to 6 per cent. copper, which was called the 'Cabin Bluff,' and is at an altitude of 700 feet.

"About 500 feet back round the hill and 200 feet higher than the 'Cabin Bluff,' another and larger exposure of ore was discovered and named the 'Mammoth Bluff.' This has been cleared off to a large extent by surface stripping and shows a height of 300 feet of mixed pyrite and chalcopyrite ore, carrying 4 1-2 to 5 per cent. copper. This ore deposit has been prospected by several tunnels, in all 350 feet in length.

"There are several smaller showings on this hill, and these, with the 'Cabin' and 'Mammoth' bluffs, have been prospected by 2,000 feet of open-cut, beside the tunnels. To tap these ore bodies at depth and form a main working tunnel, a long drift has been started on the hillside 200 feet vertically below the 'Cabin Bluff,' and when the property was visited this drift was in 732 feet. At 430 feet in, the ore seen in the 'Cabin Bluff' above was struck, the tunnel cutting through it, the strike of the ore being N. 10 deg. W., dip 65 deg. W. The thickness of the ore body is estimated at from 25 to 40 feet, running from 4 to 5 per cent. copper. Drifts 70 feet long have been run on either side of the tunnel in ore all the way, the direction of the tunnel being 90 deg. from the strike of the ore.

"Round the hill to the south 285 feet, and at an elevation of 100 feet above the main tunnel, a drift known as the 'Pyrites tunnel,' is being run in to connect with an upraise from the main tunnel. For the first 100 feet this tunnel runs through loose granular pyrites, made up of small detached iron pyrites crystals, similar to those found on the Ecstall pyrites deposit, near the Skeena River. At 100 feet in, solid mixed iron and copper pyrites ore was struck, carrying 4 per cent. copper for 10 feet, when a lower grade iron sulphide ore was met, and the tunnel is still in this ore at 200 feet from the portal.

"The vertical height between the main tunnel and the top of the 'Mammoth Bluff' deposit is 450 feet, and with the prospecting done it is reasonable to infer that

the ore shoot is continuous for this vertical distance. The horizontal boundaries of this ore body have not been clearly defined, but it is probably some 600 feet in length by 20 to 25 feet in thickness, carrying 3 to 4 per cent. copper.

"At the 'Cabin Bluff' showing there is a considerable depression in the ground, which appears to have been caused by oxidizing and dissolving out of the pyrites ore body, and there is a large deposit of hematite in a small flat of 10 acres south of the ore showings, where this dissolved ore has been redeposited. Samples of this deposit gave the following assay: Iron, 60 per cent.; gold, 0.10 ounces; copper, 0.2 per cent.

"The country rock in the vicinity of the ore body is made up of altered argillites or shales, traversed by felsite, diabase and porphyrite dikes, these dikes being of later origin than the ore. In some parts of the deposits there is a vein filling of quartz, but the main body is composed of solid sulphide ores.

"There is an 87-foot waterfall on a small creek 1 3-4 miles northward of the main tunnel, where 600 horsepower is developed by an impact wheel of Pelton type. This runs an 8-drill Rand compressor; also a small sawmill capable of cutting 7,000 feet a day of rough lumber.

"Transportation facilities are being provided by the installation of 2,500 feet of gravity tramway and one mile of an electric tramroad on a seven-tenths of one per cent. grade. This will bring the ore to deep water, where it can be shipped to any of the coast smelters.

"The property is under the general direction of Mr. M. K. Rodgers, American Bank Building, Seattle, Washington."

Last summer I was given the following information relative to this property by one who claimed to be well informed concerning it: "The developed ore zone has been opened for a little more than 2,000 feet in length, and from 200 to 500 feet in width. Beside some 1,500 feet of open-cut work, about 1,000 feet of tunnelling has been done. This work has opened a large body of copper sulphide ore, running from 4 to 8 per cent. (with some as high as 12 per cent.) in copper, and $1 to $3 per ton in gold and silver. It is a very favourable ore for smelting, carrying an excess of iron over silica. Much of it is pure copper and iron sulphide, high in both iron and sulphur, so making it a desirable smelting ore, less coke being required for its reduction than for other ores having constituents less favourable from a metalliferous point of view.

"The ore has been cut for a width of 125 feet and down to a depth of between 400 and 500 feet, and it is known to be good to below the 400-foot level. The quantity of ore blocked out is more than 300,000 tons, and the mine is sufficiently developed to warrant the erection of a 300-ton smelter."

The foregoing information will serve to give a general idea of the property the Granby Company has taken under bond. It is probable Mr. Graves is not quite correctly quoted in the statement attributed to him, in effect that the Hidden Creek property is "one of the greatest mines on the Pacific coast." It is likely that his comparison was intended to be restricted to the British Columbia coast district. If not, then the opinion may be expressed that it is premature to express any such opinion in the present state of development of the Hidden Creek mine. Nevertheless, there seems some good reason to believe there is in that mine a large tonnage of copper ore, but of general average grade somewhat lower than the stated 3 1-2 per cent. copper.

OUR LONDON LETTER

British Interests in Canadian Affairs—The Asbestos Trouble—The Tin Market and the Coming of Nigerian Tin—Oil Developments—The "War" With Some Further News of Maikop—Russia's Abounding Copper Production—Copper in Asia Minor and China—Rand Conservatism — Important New Reduction Works on the Rand.

(Exclusive correspondence of CANADIAN MINING JOURNAL.)

Despite the interest that things Canadian on the whole excite in Great Britain that interest does not extend to the Dominion's mines as a rule. In the days of Whittaker Wright there was a boom started by the forming of the British American Corporation and somewhere about $25,000,000 were raised with the utmost ease and companies like Le Roi and others were floated, the shares going easily and big premiums being secured. A few years passed by and there came the Whittaker Wright smash with the suicide of the promoter on the eve of his conviction for fraud. The companies that owed their origin to his skilful manipulation dragged on during the succeeding years and have gradually faded away one by one, Le Roi being practically the last to disappear. This company is now being wound up.

Turning to one Canadian matter that deeply interests English investors the news was definitely published on October 20th here that the Amalgamated Asbestos Corporation was in an unsatisfactory position. This corporation endeavoured to place $15,000,000 in 5,000 first mortgage bonds in London some seven months ago but the response was very small and so far as concerns this country interest in the affairs of the corporation centres in the effect which its fortunes may have upon the United Asbestos Company which is an English undertaking. I understand that no ill effects are anticipated for this English company and that in so far as there is likely to be some alleviation of the intense competition which has prevailed recently the position of the United Company may possibly be improved.

The fierce competition in the asbestos industry has reached a level where it is almost impossible for matters to become any worse. During recent years the English United Asbestos Company, like its predecessor, has adopted a very conservative policy, and the directors have made every endeavour to husband their resources. It seems likely, therefore, that in the event of any revival in business the company would benefit substantially. On this side the position of the Amalgamated Corporation is rather obscure.

The tin market to which I made some reference in my last letter continues to provide plenty of excitement on the London Stock Exchange and in the metal market. Just prior to the date of writing there has been another jump in the price and the cash figure of the metal is practically $100 higher per English ton than at the beginning of August. The Nigerian alluvial tin propositions to whose origin I have in an earlier article made some reference are getting more numerous on the London market. The most advanced company in production amongst them is the Naraguta, which has al-

ready attained an output of 45 tons of tin oxide a month.

The "Oil war" is well with us now. When the news first came to hand that the "Shell" Transport Company "whose interests are now combined with the Royal Dutch Petroleum Company," had torn up its agreement with the Standard Oil Company of America, considerable anxiety was caused among shareholders of European oil companies, especially the recently created Maikop concerns. More mature consideration caused many experts to declare, however, that no war exists and that the cut in prices was merely rendered necessary by the enormous accumulation of oil stocks.

The enormous surplus awaiting consumption, taken in conjunction with the development of the new Russian field at Maikop and the threatened intrusion of further new fields such as that just being exploited in Persia and the deposits discovered in the northern part of the Island of Sakhalin in Siberia, has produced a situation which would practically compel reduced prices. Oil shares have therefore largely recovered the losses sustained when the war was first announced. Oil investors here are encouraged by the theory that the more oil there is produced the more the demand for it will spread. This theory is supported by the results of the use of oil on steamships and on railways where the only difficulty has lain in obtaining regular supplies. It is held, therefore, that if the ultimate result of the oil war is to increase consumption of oil as fuel it will prove a blessing in disguise to those producers who are in a position to readily market their crude oil.

With regard to Maikop most conflicting statements continue to be issued. An interview with the Russian Minister of Finance declares that it is quite a mistaken impression that the Russian Government does not favour foreign enterprise in Russia. With regard to British Maikop companies, the Russian Government may, however, consider it necessary to require some guarantee that the work of prospecting with oil will be substantially carried out. It is possible that some standard of requirements may be fixed to which all companies applying for recognition must conform.

A "Times" correspondent who has recently gone all over the oil field comes to the conclusion that the country is satisfactory. An important factor is, however, developing. It was thought originally by geologists and experts that the Maikop field had a length of some 20 or more miles and a width of at least four or five miles. As the result of sinking wells the latest expert opinion is that for all practical drilling purposes the width of the field may not be more than a mile. In the course of the next few months a great deal of valuable information will be obtainable as the results of many borings become known. Of course, even if the field were to be only a mile in length instead of four or five miles, it could still be a great oil field. What we are waiting for, however, are trustworthy data.

All kinds of delays are taking place in connection with the official recognition of titles, the definition of boundaries, and the right to work. Old and experienced drillers, however, from Baku, Galicia, Roumania and California are actively employed on the field. It is said that 60 wells are sunk or in the process of drilling, with derricks being erected.

Whilst on Russia a word might be said of that empire's rapidly advancing copper production. From being an importer Russia is gradually turning into an exporter, her production having increased in ten years from 445,000 poods to 1,116,920 poods. The imports of copper have shrunk in five years from 1,262,000 poods to 213,000 poods. Electrolysis has been the critical question, but it is now being got over, the production of electrolytic copper advancing by leaps and bounds. The great Russian copper fields are the Urals, the Caucasus and Siberia. The production for the first half of this year shows a further rapid increase which, if continued, will make Russia's whole production for 1910 close upon one and a half million poods. The world's increasing consumption of copper will render it necessary to open up still further copper fields. (One pood equals 36 pounds.)

Many reports are to hand here with regard to fresh great deposits. In Asia Minor, in the neighbourhood of Diarbekir, there already are rich producing mines working ore that has an average of 30 per cent. copper, 40 per cent. iron and 30 per cent. sulphur, but beyond these there are great deposits which have not been tapped extending along the Black Sea shore near to the port of Trebizonde in which copper ores exist to a great, but unknown, extent in conjunction with manganese. Further afield, on the borders of Thibet from the Kansu Province of China, one hears extraordinary accounts of immensely rich and widespread deposits. An experimental plant has been put down to the order of the Chinese Government under British management which may be the beginning of an industrial revolution in that remote part of the country. The spot selected is in a valley about 100 miles west of the city of Sanchowfu and the experimental plant is capable of treating 50 tons a day.

The obstacle to treatment earlier here lies in the fact that the ore has an enormous capping of "loess" which in some places is 200 feet thick. So high is the opinion of the Chinese Government with regard to the copper possibilities of Kansu Province that although gold mining concessions are freely granted there the imperial authorities intend to keep the control of the copper in their own hands.

A private cable from Johannesburg to London states that during September the Rand mines alone crushed 1,835,647 tons of gold, the total profit being $4,711,650. The average yield per ton works out at 28 shillings and 3 pence and as the working costs figure out at 17 shillings and 11 pence, the profit per ton is 10 shillings and 4 pence. It will be observed that in the 30 days of September the tonnage crushed was slightly more than in the 31 days of August with an increase also in the daily average profit as compared with that month.

A special event on the field was the virtual completion of the new reduction works of the City Deep mine. It is curious to note how conservative the Rand has been and what a long time it was in taking the tube mill from Australia and the Butters Vacuum Filter process from the United States and Mexico. Returning to the City Deep, the present plant is designed to handle 65,000 tons per month. Ore coming from the western shaft is dumped by five-ton skips over grizzlies into fine and coarse ore bins up against the steel headgear. The main ore bin has a capacity of 1,000 tons, and above it is the preliminary crushing plant. Hopper bottom doors operated by compressed air are fitted to the bin, and through these doors the crushed ore and fines are discharged into trucks for transport to the mill. A similar crusher station will be erected at the eastern shaft when the scale of crushing is increased.

The line up to the mill is over a mile long, mostly on embankment. The train of ore will consist of four (or more) 40-ton all-steel Klussman trucks. They will be drawn by an electric locomotive consisting of two 25-ton, six-wheeled halves coupled, and will be of 150 h.p The locomotive will operate on 2,000 volt, 50 cycle,

three-phase current as furnished by the power company. A general system of lines connects the mill stores, general yard, workshops and coal siding.

The mill consists of 200 stamps, arranged in units of ten, each unit being driven by a 50 h.p. motor. Weight of stamps when new, 2,000 pounds. The stamps have long heads and short stems. A layer of half-inch felt is placed between the mortar bases and the concrete foundations. There are no king-posts, as the concrete foundations are carried up 14 inches wide, with indented steel bar reinforcing to above the level of the mortar-box tops. On the tops of the foundations is bolted a heavy cast-steel frame, which carries the cam shaft and stem guides. Each cam-shaft rests on 11 bearings, as beside the three bearings there are bearings intermediate between the cams. This is to minimize, if not entirely obviate, cam-shaft breakages by reducing vibrations. The stems run in cast-iron guide blocks bolted to the steel guide girts, but with a wood cushion between. As these stamps are designed for very heavy duty, each set of five stamps is provided with two challenge feeders to feed behind the second and fourth stamps of each mortar-box.

Practically the whole mill is of steel, wood only being used for the bin lining, for minor purposes and for fastening on the corrugated iron. The mill pulp is elevated twice, once between the batteries and tube mills, and second between the shaking tables and the sands collectors.

The tube mill plant comprises nine mills 5 feet 6 inches by 22 feet, driven by a slow-speed motor. In order to avoid crowding together of classifying cone and pebble feed, the driving arrangement is at the outlet end of the tube mill. It is at the inlet where most attention is required, and the presence of driving gear there is both inconvenient and dangerous. Behind the tube mills is the gold recovery house, where all the gold is recovered and handled. Each of the nine tube mills has seven shaking tables, with room left for an eighth if required. It will be understood that, in conformity with most modern practice, no amalgamation is done in the battery itself. There are 18 extractor boxes.

The sands collecting plant consists of one row of six vats built in reinforced concrete, which is the outstanding feature of the whole equipment. From the collectors the sand is taken to the leaching vats, of which there are 12, by means of conveyer elevator belts. Blaisdell distributors and excavators are used, and all power for the operation of the plant is purchased electricity.

RECIPROCITY IN COAL

Its Probable Effect on Nova Scotia—An Eastern Point of View.

(See Editorial Pages for Comment.)

Through the courtesy of Mr. J. H. Plummer, president of the Dominion Coal Company, the CANADIAN MINING JOURNAL reproduces a memorandum concerning reciprocity in coal, which has been submitted to the Dominion Government on behalf of the company.

Following is the statement:

1. Such support as a policy of reciprocity in coal has received in Canada appears to be based on the theory that the Nova Scotia collieries would secure a large market in New England, to offset their loss of trade in Quebec and Ontario. It is assumed that the policy could not be discussed except on this theory.

2. The free access to the United States markets which the Nova Scotia collieries would gain under reciprocity would, however, be an almost empty privilege.

The coal trade in Boston and New England has in recent years been revolutionized by important developments in the mining and transportation of coal. The conditions which formerly existed have entirely been changed, and the ability of the Nova Scotia collieries to find a market there has steadily decreased.

The developments have been general, but are most marked in the West Virginia coal fields, whose products reach the seaboard at about the same distance from Boston as Louisburg. By the construction and equipment of railways, steamers, loading and discharging plants, and other modern transportation facilities of the most modern and most economical type, at an enormous cost, the West Virginia mines have gained a strong hold on the New England market. These developments still continue, and the cost of production and transportation may be further lessened.

The consolidation of the New England railroads has also affected the situation. Their enormous trade of 5,000,000 tons gross a year all goes to American channels, and so far as the supply of coal by rail is concerned, their influence cannot but be entirely in favour of American coal.

3. Nova Scotia coals are generally excellent steam coals, but those from West Virginia are less volatile and are freer from sulphur; they are, in fact, of a different class, make less smoke, and are generally more desirable. The appliances installed by the large consumers are adapted to the use of this coal, and they cannot without inconvenience and expense use Nova Scotia coals, which debars us from their trade.

4. Notwithstanding our efforts to sell coal in New England, our shipments have been steadily decreasing, and even with concessions in price equal to the amount of duty, we have recently found that we could not secure contracts. We made strenuous efforts to place coal in New England during the past year, chiefly to provide steadier employment for our men during the winter months, and were willing to work on a very small margin of profit, but were entirely unsuccessful.

5. These conditions arising out of the natural development of the trade are in themselves conclusive, but, in addition, an absolute bar to the sale of our coal has been created by the legislation passed by the State of Massachusetts in June last, to abate the smoke nuisance. By this legislation the State has practically closed its doors against Nova Scotia coal; the terms of the Act, which is supplemented by local regulations elsewhere, as at Springfield and Worcester, preclude

the use of the high volatile coals in the chief New England markets, except under conditions which are commercially unattainable.

6. So far as we can judge, reciprocity would give us nothing tangible to make up for the loss of other markets, and would lead directly to a decrease of production. It might be that with a lessened production of coal throughout the province, labour would be more plentiful, wages lower and supplies cheaper, and that the collieries capable of being most economically worked might thereby be able to avert the more serious consequences, but this would merely place the burden on other shoulders.

7. It is scarcely necessary that we should refer to the effect on the Province of Nova Scotia; on the provincial revenue from royalties on coal; on the miners and other workmen; on the trade of the province, both internal and with other provinces. The large coal carrying trade on the St. Lawrence would be curtailed, and its benefits to the ports on the St. Lawrence and in Nova Scotia correspondingly decreased.

8. Several objections of a practical nature may be briefly stated:

(a) There are obvious disadvantages inherent in a terminable arrangement; they cannot be eliminated, and a long term agreement would only defer them. During the period of reciprocity new and cheaper lines of carriage would be developed; new business connections and alliances built up; consumers would become used to and provide appliances for a different class of coal, etc. All these conditions would be the more developed as the period is lengthened; they would make the recovery of our lost markets very difficult, and tend to perpetuate the control of our markets by the American coal mines.

The lack of permanency would also affect the installation of the facilities for handling coal, without which the Nova Scotia collieries could not hope to enter the New England market. Wharves, discharging plants, railroad connections, etc., would involve a heavy investment of capital, which would be imprudent under a terminable arrangement, even if the other conditions would justify it.

(b) It must be expected that our American competitors will join with the railways and others to hold the home market; such an alliance would be more effective now than at any time in the history of the trade, because of the conditions referred to above.

(c) The mere removal of the duty would not place us on equal terms; we should be in a foreign market, with everyone who could be moved by patriotic, local or interested motives, working against us.

(d) As regards the anti-smoke legislation, which in itself seems to put the question of reciprocity outside the possibility of discussion, it may be argued that reciprocity would lead to a modification of this law, but the State Legislature and the municipal authorities are not controlled by the Federal Government, and we see every reason to look for a wider application of the principle rather than the reverse. It appeals to the ordinary American citizen as a distinct advance in civic conditions, which incidentally supports a home product, and he would be strongly influenced by both considerations.

10. This memorandum expresses the views of this company only, and does not assume to speak for others, but the judgment expressed above as to the disadvantages of reciprocity to the Nova Scotia collieries is concurred in by producers of 90 per cent. of the coal mined in the province.

Some general considerations bearing on the question are set out in an appendix in further support of our views, and the whole is respectfully submitted for the consideration of the Government.

For the Dominion Coal Company, Limited.

J. H. Plummer, President.

Montreal, 8th October, 1910.

Appendix.

The foregoing memorandum is directed to the situation as more particularly affecting Nova Scotia, but if our belief as to the effect of reciprocity in that province is well founded, it is fair to ask whether the conditions elsewhere call for such a sacrifice of Nova Scotia interests.

2. So far as we are aware no objection to the continuance of a duty on coal exists in the Province of Quebec, except of the most limited character.

Objection is said to exist in the Province of Ontario, which province largely benefits by the demand for machinery, food supplies, etc., created by the coal industries in Nova Scotia, and by the iron and steel industries which depend on and are bound up with them. The following comments on the position of purchasers of coal in Ontario are therefore respectfully submitted:

(a) The manufacturers of Ontario are not handicapped in their manufacturing costs by the duty; the cost of coal to them, duty paid, is about the same as to their eastern competitors. In the case of slack coal, which they use largely, the duty is so low that its removal would have no material effect.

(b) No tax is more fairly distributed. Manufacturers add it to their costs and prices, and, in theory, if it were removed the saving should go to their customers. Railways add it to their passenger and freight rates, and, theoretically again, if the duty were removed their rates should be reduced by precisely an equivalent amount, as the tariffs approved by the Railway Commission are based on the current cost of operation.

(c) It may be doubted whether the removal of the duty would decrease the price of coal in Ontario; it had not that effect in the case of anthracite. It is true that there is more competition in bituminous coal, but the business of mining soft coal in some of the districts which supply Ontario is known to be in a very unsatisfactory state, and carried on without a reasonable profit, and it may, therefore, be expected that with the removal of the duty, the mine owners would try to hold the market at current prices; it would be entirely within their control, and the Canadian consumer would be helpless against any combination that might be formed.

(d) The coal industry of Nova Scotia, with the iron and steel industries which directly depend on it, furnish the chief exports from the province to other parts of Canada, and are the foundation, in turn, of the large purchases made by Nova Scotia from the western provinces. The volume of this trade is unquestionably very great, and it is secured to the farmers and manufacturers of Ontario and Quebec by the tariff.

The cost of these imports is relatively high, and the prevailing wages paid to miners and steel workers are also high, due chiefly to the high cost of living. These conditions are accepted as equitable under a fiscal policy which seeks to protect all parts of Canada alike, but the same consideration requires that no changes which would disturb the general balance of trade, or injure one province to benefit another, should be considered.

3. The importance of the industry to the Province of Nova Scotia is very great. Its entire revenue in 1908 amounted in round figures to $1,783,400, of which $616,900 was derived from royalties on coal. The proportion

was somewhat smaller in 1909 because of labour troubles.

In 1907 the coal mining companies in Nova Scotia paid out for labour and supplies a sum slightly exceeding $10,000,000; this is based on the actual figures furnished by the various collieries. The amounts paid out by the iron and steel manufacturers, whose ultimate prosperity is bound up with that of the coal companies, would not fall much short of the same amount.

4. A comparison of labour conditions may fitly be made. In the eastern and southern coal mining districts of the United States a large number of foreigners and negroes are employed, and from this and other causes the cost of mining as compared with Nova Scotia is much lower.

The men employed in the Nova Scotia collieries are of an excellent class; they are as a whole, very well paid; their standard of living is high, and the provisions for their safety and comfort are far beyond what is customary in the United States. The mining laws of Nova Scotia are as advanced in this respect as in any country in the world, and the coal companies find it to their interest as well as their duty to carry them out faithfully.

We respectfully submit that the difference in labour conditions should be considered when a proposal to wipe out our tariff protection is under discussion. The laws of the province respecting mining, the general influence of our Canadian standards, and the character of the population which supplies the greater part of our labour, make it impossible for us, even if we were willing to use the cheap labour which our competitors are able to employ.

MINING—A BUSINESS.

(Written for the CANADIAN MINING JOURNAL.)

[EDITOR'S NOTE.—This short article was written at the express request of the CANADIAN MINING JOURNAL. To our mind it delimits admirably the function of the mining engineer—although this is not the theme. We are especially in accord with the writer's remarks anent the word "conservative." His strictures are just. That word has been used to cover much moral cowardice. The word that should supplant it is a homely English word—"honest." We earnestly invite comment on this article as we recognize the fact that on all such propositions there is room for difference of opinion. Moreover, we are diffident about forcing our own views upon our readers.]

The untutored have believed, and the general public suspected, that precious metal mining is in all its aspects a pure gamble like roulette. This impression has obtained partly through the sentimental side of human nature, and partly because of misconceptions on the part of those untrained to the business of getting gold and silver. These latter believe that little knowledge is necessary to win a fortune in mining fields. Nothing can be farther from the truth. It can be easily shown that a hard and careful training only can fit men to mine—with success.

In considering this matter, we may conveniently divide our subject into two parts. The indefinite, and the definite. It must be granted that any man or group of men wishing to make a business of mining must be possessed of the necessary capital, or be in a position to control and obtain this capital. And it must be further laid down that no mining operator (using the term operator in the sense of a single capitalist or a group of capitalists), will confine his risk to any one prospect to insure a profitable outcome for his undertaking. In other words, if he is going to make mining a business he must be persuaded or determined to distribute his energies over sufficient number of mining risks (guided by proper advice) to insure obtaining what he seeks; namely, a profitable mine. Those prospects, which we know as mining risks, which fail to satisfy his expectations, must be consistently written off to business losses, and charged against the successful property which he will ultimately control if he prosecutes the business steadily and intelligently. That part of mining which we term the indefinite part, is the prospecting and geological work necessary in the early stages of a deposit giving evidence of some interest to the miner. There is no line of demarcation between the indefinite and the definite parts of the business. As the prospect becomes more developed, competent engineers will readily advise their clients whether it promises a profitable outcome, or whether the venture should be abandoned. The early part of any operator's work must necessarily therefore be regularly guided by the geologist and the engineer, and it will depend upon their advice how much and what kind of work will be carried on. Should the deposit prove commercially valuable, it will gradually pass to the definite stage, and will show profitable mineral in place, and ore reserves that can be determined and the value of which in metallic contents estimated. When we have arrived at the estimation of ore reserves, even at that stage which we know as prospective ore reserves, we may be right in saying that the prospect has passed from that stage into what we may reasonably term a developed mine. If the ore opened by this development would indicate that the amount of money already expended is covered by value existing in the mine, we are right in saying that the mine has passed to the definite stage, and all work done can be, and should be, well done on business lines, and all risk for the capital expended can be almost if not entirely eliminated by a combination of good financial management, good operating management, and proper technical skill.

In every mine we must realize that there is the cooperation of three kinds of talent necessary in the commercial outcome of any mining venture, namely, financial management, or the business of the financier or capitalist, the department of mining which demands the service of the skilled mining engineer and geologist, the equipment and treatment of the ore, or the skilled metallurgist. These latter two divisions may have a number of sub-divisions that merge one into the other, or may be efficiently found to exist in one man; but this is not often the case. In any case it is for the operator to call to his aid the necessary skill that these various departments demand in order to be sure of the outcome of the proposition. Should he fail to seek this advice, his neglect cannot be debited to the mining industry. Mining conducted in this fashion should, and does, recompense and reward those engaged in it very handsomely. In fact, if prospects which are only intended to be gambles from the start are eliminated, it will be found that the percentage of mining failures is less than in any other business that we are acquainted with, and the reward greater than in almost any other business. This fact is amply proved by the history of the Western States and Mexico, where have been built up splendid towns and cities from the profits of the surrounding mines, and it is possible that the mining industry in the snow covered woods of Ontario will do more in a shorter time to build up Eastern Canada than all the other industries combined.

It may be generally accepted as a fact that where a report, described as conservative, has been made, it means little or nothing. An engineer comes to a decision on the facts as they are presented, or as he sees them. That decision represents in the competent engineer a true statement of the conditions, and should indicate an exact valuation for the property, the engineer making the proper and necessary deductions from the result of his examination. It is therefore absurd to describe a report as conservative. A report is either right or it is wrong. It should be neither conservative nor liberal. It is exact within the limits of our knowledge at the present time, and it may be generally stated as correct that where a company is operating without the services of competent engineers, it is not operating the mines in the interests of the investor, but in the interests of the stock market. A company that means to mine seriously is always willing and able to surround itself with competent talent, so that those engaged in its financial management shall not be called upon to explain and bear the burdens of its technical management. This can only be accomplished by employing engineers, geologists and metallurgists who have had not only the necessary training, but the necessary and varied experience that fits them to be competent associates and guides to the financiers who are responsible to the stockholders.

A NEW ELECTRIC ARC PROCESS FOR PRODUCING AND REFINING STEEL

By Frank C. Perkins.

The accompanying drawings indicate the construction and arrangement of electric ladles or furnaces with or without covers and composite electrodes for operating an improved process of producing and refining a high grade of steel low in phosphorus to analysis desired. It consists in electrically treating molten iron from a blast furnace or while cold, or low grade molten steel as taken from a Bessemer converter or open-hearth furnace with electric heat produced by an arc or arcs formed between the slag of the bath and specially designed electrodes. Several forms of composite electrodes are indicated in the drawings, one consisting of a cored carbon or a mixture of carbon, and lime and oxide of iron or other slag producing materials in the form of a pencil. Another shows the slag materials packed in an iron or steel tube, and still another surrounding a carbon or iron rod or rods with or without projections for supporting the slag materials with a binder, such as tar.

The use of the composite or combination electrode, instead of the usual carbon electrode or an electrode of pure iron, introduces the fresh and additional refining slag materials to the bath fused and in a highly fluid state at the hottest points which are at the arcs or at the points of contact of the electrodes and the layer of slag floating on the bath of molten steel.

When two of these electrodes are used in an electric furnace of the double pole type, the current passes from one electrode into the slag and through the slag as a resistance and out the other electrode, the two arcs operating at about 100 volts pressure. One electrode may extend into the slag or down into the molten steel below the slag, a single arc only being employed at this time formed at the other electrode, with a pressure of approximately 50 volts.

The double pole electric furnace is well adapted for practising this composite electrode process similar to the Heroult method, because when the two electrodes are introduced into the refining slag, the latter acts as the resistance and forms one or two arcs according as to whether one or both electrodes are out of contact with the bath and producing the arc or arcs. If one arc is used the other electrode may be raised and lowered by electric motor driven hoist stirring the molten bath by this action.

An ordinary basic lined ladle, crucible or pot, may be used as noted in the drawings without cover, which may be supplied in the same manner as a basic lined two pole electric furnace. This ladle having received the charge of molten steel from a Bessemer converter, is electrically refined by eliminating the phosphorus and sulphur, as far as desired, and is, if necessary, deoxidized and recarburized. The steel is then poured into the ingot molds, after an electric treatment of from a few minutes to an hour or more in the electric ladle, according to the degree of refining desired.

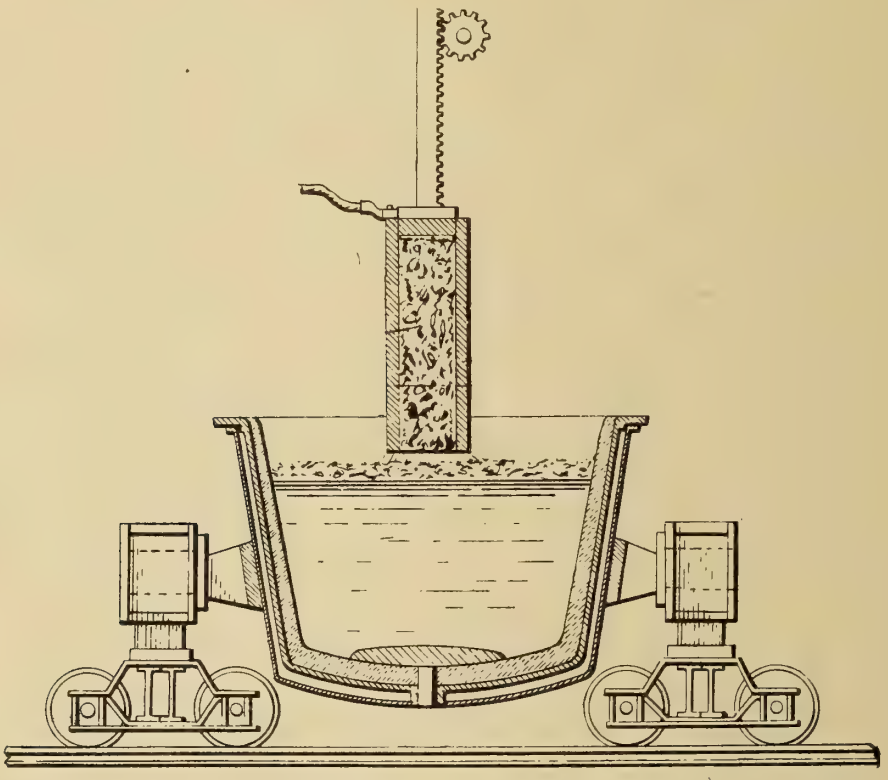
When only one of these electrodes is used in an electric furnace, this electrode extends into the refining slag forming the arc at this point, the current being conducted through the molten bath and out through the bottom of the ladle, similar to the Girod process.

Another construction shows double arc or single arc action taking place when a ring electrode is arranged on a level with the slag. A single arc action only at centre may be employed, the outer electrode dipping into the slag or molten steel.

By this electric arc process the molten metal continually circulates, all particles of the bath coming into contact with the refining slag at the arc or arcs and elsewhere and being rapidly refined, remaining at the highest temperature only a short time, then replaced by other particles of molten steel reaching the slag near the arcs.

It is held that in the Heroult arc steel furnace the circulation in the bath is always active and the average temperature may be kept as low as any other furnace and all parts of the bath come rapidly into contact with the slag. In case a deep bath of say 10 or 12 tons or more is used in the electric ladle and additional circulation is desired, one electrode may be plunged up and down in the metal by a hoist mechanism, as previously mentioned, while the other electrode produces the arc with the slag.

By the use of these special electrodes made with slag producing materials, the highly fluid slag at the arcs causes rapid circulation to take place and the bases are removed, which are often retained in the metal and cause bad steel when poured into the ingot molds directly from the Bessemer converter without electric refining.



Furthermore, in tbis electric refining process segregation of sulphur and phosphorus are largely avoided, while any quality of steel may be produced regardless of the quality of the raw materials.

It is well known that the Bessemer converter process for making steel is far cheaper than the open-hearth process, but the quality very largely depends on the metal, ore and other materials available, and it is not possible to test the metal during the operation. The resulting steel, therefore, from high phosphorus and high sulphur charges, contains an injurious quantity of sulphur and phosphorus, which cannot be eliminated by the existing acid Bessemer process. Too much or not enough carbon, manganese, silicon or other elements can readily be corrected and gauged by the charge introduced into the converter and subsequent treatment, but phosphorus and sulphur less than .09 and preferably below .05 is desired and this is not attainable by the existing Bessemer process.

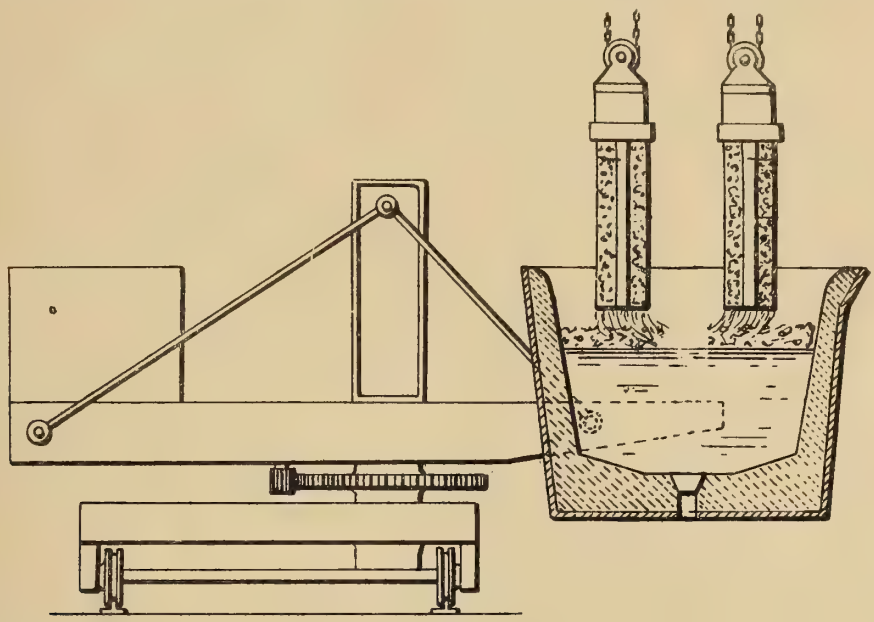
tending from 75 to 90 minutes or more, taking molten metal from an open-hearth furnace and electrically treating same with oxidizing and neutral slags, the phosphorus can be brought down to .003 per cent., and the sulphur down below .007 per cent.

By the use of the present invention with composite electrodes containing slag producing mixtures, it is possible to reduce the phosphorus to .03 or .05, which is 10 to 20 times as much as the above in a far shorter time and within practical limits for Bessemer working.

It is also well known that the carbon is always eliminated before the phosphorus, and if it is attempted to carry the reduction far enough to lower the phosphorus, in an open-hearth furnace, the metal is highly oxidized and decarburized. The present invention provides a means of taking the highly oxidized metal from the open-hearth furnace, if carried far enough to eliminate as much phosphorus as desired, and by the electric treatment with the electric arc and these special elec-

This new composite electrode process may be utilized as an auxiliary treatment to the Bessemer process for eliminating the phosphorus by employing an oxidizing slag in the bath as the molten metal is treated in the electric ladle with the arc, the auxiliary slag producing materials in the combination or composite electrode acting instantly on the metal and the slag being in a highly fluid state as it melts in the high temperature of the arc.

The highly oxidized metal from a Bessemer converter overblown may be utilized deoxidizing same in the electric ladle by this process. It may be stated that the desired end to be attained by this electric auxiliary process with the Bessemer converter for rail making, particularly, is the reduction of phosphorus to .05 or thereabouts by the oxidizing slag and electric arc, the other elements being easily controlled by existing Bessemer methods.



It is well known that with the Heroult electric furnace, having pure carbon electrodes and a treatment ex-

trodes having neutral slag mixtures, it is also possible to eliminate, if desired, nearly the last traces of sulphur, the metal being deoxidized and as much carbon being added as found desirable, producing a finished steel of any degree of perfection desired, according to the length of time the electric treatment is carried on.

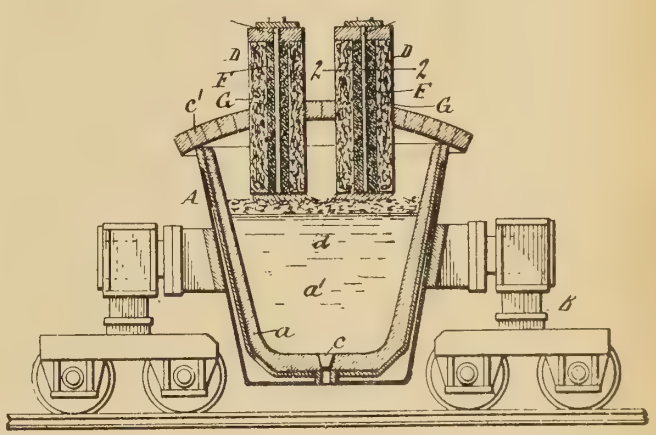
It may be stated that in metal taken from an open-hearth furnace, if the reduction is carried on long enough to reduce the phosphorus to .01 per cent. or less than this amount, the carbon is eliminated. It is, of course, true that such a highly oxidized metal would be very unsatisfactory in practice, but by means of the electric furnace treatment with these composite or combination electrodes, the arc and proper slag mixtures, introduced in the molten bath, together with the proper mixture in the electrodes themselves acting as auxiliary slag producers, will bring most satisfactory results, eliminating the sulphur, adding the proper amount of carbon and deoxidizing the steel completely.

The proper mixtures can be introduced into the molten bath and also provided in the electrode mixture to remove the sulphur on account of the high temperature of the electric arc even though the slags selected could not be used by any other than the electric treatment without addition of other slag materials to lower the melting point, and this would interfere with the efficiency of operation. The slag mixture is also melted to a highly fluid state at the arc largely from the mixture in the electrode itself, placed there for this purpose, of slag from oxygen in the air so that no further oxidation takes place.

The determining questions of the electric refining of steel are cost and output. By shortening the time of treatment with the special composite electrodes combined with slag producing mixtures, and refining only down to such percentages of phosphorus and sulphur as are essential for rails and structural steel, the electric power consumed is so low and the time required so short as to be practical for this work.

in addition to that supplied in the ordinary way on the top of the bath.

Ordinarily there is great trouble, and it is very costly to deoxidize the metal by existing processes, and it is claimed that the pipes and blow holes are produced in the ingot and other difficulties result from the presence of iron oxides. It is also maintained that when ferro-silicon and ferro-manganese are used to prevent these troubles, the oxides which result stay in the steel as an "emulsion" in a finely divided state.



With these special electrodes and the use of an electric arc for refining purposes, materials can be used in the electrodes or added to the bath for a neutral slag, as it is maintained that a thorough deoxidation of the steel is not possible when there are iron oxides in the slag, as they will react to a certain extent with the molten bath of steel.

It is held that adding carbon under ordinary conditions will not result in complete deoxidation, as both iron carbide and ferrous oxide readily exist together. By means of the electric process of steel refining with these combination or composite electrodes, however, carbon or a mixture of carbon and iron may be added to the slag as an auxiliary to the carbon mixture of the electrode, forming calcium carbide and resulting in deoxidation without the slightest difficulty at no great expense, and on any scale desired by providing electric arc apparatus for several electric furnace ladle cars arranged for serving various Bessemer converters or open-hearth furnaces.

The desired amount of manganese can be added for counteracting the bad effects from the ferrous oxide, the carbon reducing the manganese ore which has been added to the slag and taking out the last traces of ferrous-oxide, leaving the steel bath protected by the layer

By this process cheap ore can be used having higher phosphorus and sulphur, these ores being abundant, while high grade ores are nearly exhausted.

By this process of only taking the metal from the converter or open-hearth furnace when it is nearly finished steel and molten, only completing the refining operation electrically, only one-quarter of the electric power and less time is required than when electrically heating from cold metal. It is of value as an auxiliary process to the Bessemer converter and open-hearth fur-

nace, taking the molten metal with little loss of heat and refining same to any degree, according to time taken, the mixtures of carbon and iron or steel combination electrodes used and nature of slags employed.

While this process is specially adapted to the refining of molten steel taken from the Bessemer converter and open-hearth furnaces and treated in an electric furnace

or ladle, it is not confined to this, as the identical process will convert iron into steel from the molten or cold state without being previously treated in a Bessemer converter. Any grade of steel may be made regardless of quality of raw materials, and carbon may be eliminated from electrodes for special steel making, the current being conducted to the arc by the iron rod instead of carbon and iron oxide, or composite electrode.

The neutral slag electrodes may work with a low current arc or dipping into slag and heating by resistance, and the steel may be kept for hours under this molten neutral slag without changing its quality. The metal may be cast, remelted or worked over to a higher or lower grade, or it may be cooled, chilled and melted a second time without injuring the quality of the steel.

The cost of production in this process is low, as most of the work of steel-making is done by the Bessemer converter or open-hearth furnace, only the removal of small percentages of the phosphorus or sulphur from the steel being attempted or the deoxidation of the metal, this being a good product for the larger rolling mills which supply demand of rail, and structural steel interests. The partial removal of the injurious phosphorus and sulphur reduces the time to a few minutes intsead of hours, hence reduces the current required per ton.

It may be stated that the shorter time also lowers cost of linings and refractory materials per ton of metal, as many charges may be treated in same time required for treating one open-hearth charge. This shorter time process only reducing phosphorus from .09 to .05 for rail steel instead of to .003, which is possible by longer treatment, makes it a practical process for rail mills dealing with Bessemer converters treating full charges of fifteen tons in electric ladles, handled by cranes taking same to positions where electrodes are inserted.

After treatment the metal is drawn from the bottom of ladles or tilted and poured into the ingot molds after slag has been removed. These easy methods are of vital importance, as any new process for removing phosphorus and sulphur should not greatly increase the cost of power; should not cause excessive cost of basic linings or electrodes, or slag producing materials, and should be readily used as an auxiliary process in existing Bessemer plants.

ALBERTA PROVINCIAL COAL MINE OFFICIALS EXAMINATIONS

An examination for fire boss certificates was held at Banff and Frank on June 2nd, at which eighteen candidates presented themselves for examination, eleven of whom passed, and the regular examination for mine managers, pit bosses and fire bosses was held at Banff, Frank and Edmonton on November 3rd, 4th and 5th. At the latter examination 86 candidates sat for examination, 58 of whom passed, as follows: Managers, 27 sat for examination, 16 passed; pit bosses, 27 sat for examination, 20 passed; fire bosses, 32 sat for examination, 22 passed.

In previous years the custom has been that the fire boss examination occupied one day and the pit boss and mine managers' examination two days. In connection with the November examination, however, the time occupied by the mine managers' examination was extended to three days, in order to more thoroughly cover the wide range of general mining subjects necessarily included in this class of examination.

The number of candidates who presented themselves for examination during 1909 shows a considerable increase over previous years, and with the steadily increasing number of mine officials qualifying each year, the operators should soon have no difficulty in securing certificated men to fill all official positions at the mines. A number of provisional certificates have been issued during the year, but the number of certificates of this class issued each year is gradually decreasing.

The following are the questions set at the examinations held at Banff, Frank and Edmonton on November 3rd, 4th and 5th, 1909:

Mine Manager Examination.

Paper No. 1. Time allowed, one and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 70 per cent. of the allotted marks to pass.

COAL MINES ACT.

1. What is the interpretation of "mine" as laid down by The Coal Mines Act? (10)
2. What are the provisions of The Coal Mines Act with reference to register of employees? (10)
3. What are the provisions of The Coal Mines Act with reference to the employment of boys in or about the mine? (10)
4. What are the provisions of The Coal Mines Act with reference to the reporting of accidents? (15)
5. What are the requirements of the Act with regard to keeping a mine plan? (15)
6. Name the different registers and report books to be kept at the mine under The Coal Mines Act, 1906, and The Coal Mines Act, 1908? (20)
7. What are the requirements of the Act regarding ambulances, etc.? (10)
8. What does The Coal Mines Act state regarding the inspection of machinery? (10)

Mine Manager Examination.

Paper No. 2. Time allotted, two and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 70 per cent. of the allotted marks to pass.

GASES AND SHOT-FIRING.

1. Give the names, composition, specific gravity and chemical symbol of each of the four different gases commonly found in coal mines. (15)
2. Where are the gases mentioned in Question No. 1 found, and how are they produced? (10)
3. What noxious gases are produced by fires and explosions of firedamp in mines? (10)
4. Name six essential features of a good safety lamp for general work. (10)
5. What principles are involved in the construction of a safety lamp that would render one lamp more sensitive in the detection of gas than another? (10)
6. What instructions would you give in reference to the care and preparation of safety lamps before giving them to the workmen, and how would you instruct the workmen as to their use? (15)

7. Explain the proper method of thawing dynamite cartridges. (10)

8. What are the dangers arising from the use of powder in dry and dusty mines, and how would you guard against them? (10)

9. Do you think coal dust will explode without the presence of inflammable gas; if so, what would you do to prevent such an explosion? (10)

Mine Manager Examination.

Paper No. 3. Time allowed, three and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 70 per cent. of the allotted marks to pass.

VENTILATION.

Coefficient of Friction, .00000002.

1. Define the terms motive column, regulator, coefficient of friction, ventilating pressure. (10)

2. Explain the principal features to be considered when contemplating the erection of a ventilating fan? (10)

3. What are the advantages of frequent splitting of the air current, and when is the limit in the number of separate ventilating sections reached? (10)

4. Find the rubbing surfaces of three airways each 6,000 feet long and all of the same sectional area, namely, 75 square feet. The forms of the three sections are as follows: The first, A, is rectangular, and is 5 feet high and 15 feet wide; the second, B, is square; and the third, C, is circular. (15)

5. (*a*) Determine the length of the motive column when the temperature of the downcast is 50 deg. F., and that of the upcast 130 deg. F., the depth of each shaft being 300 feet. (*b*) If the barometer reading in each is 29 inches, what is the pressure producing ventilation? (10)

6. If, with a water gauge of 1 inch, 40,000 cubic feet of air are obtained in an airway 10,000 feet long, what should be the water gauge when the length of the airway is extended to 20,000 feet, all other things being the same? (10)

7. If it is necessary to double the amount of air in a mine, how should the pressure and power be increased, respectively? (10)

8. What power will be required to give a current of 60,000 cubic feet of air per minute in a mine having four equal splits, the airway in each split being 6 feet by 8 feet by 5,000 feet? (10)

9. To find the percentage of mine gases given off by a mine the air at the inlet was measured and found to be 137,500 cubic feet per minute at a temperature of 61 deg. F., the air at the outlet measured 150,200 cubic feet per minute at a temperature of 76 deg. F., what is the percentage of mine gases present in the air leaving the mine? (15)

Mine Manager Examination.

Paper No. 4. Time allowed, three and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 60 per cent. of the allotted marks to pass.

PRACTICAL WORK.

1. If you had a number of men in a certain district and fire was to take place in an intake airway, state how you would proceed to rescue the men. (10)

2. If you were in charge of a gaseous mine and an explosion should occur during working hours: (*a*) What would be your first action? (*b*) Describe in detail how you would proceed into the mine to recover dead bodies or rescue persons still living. (10)

3. Make a sketch showing how you would construct an overcast. (10)

4. What useful purpose do overcasts and undercasts serve in mine ventilation, and which kind would you approve of and why? (10)

5. Show by sketch how you would divide a shaft you were sinking into the various necessary compartments, one compartment to be used for water, air pipes, and ventilation until connection with the escapement shaft is made. Answer fully. (10)

6. In developing a flat seam of coal, opened up by a shaft, and which is giving off a large quantity of explosive gas, how should the mine be planned in regard to ventilation and haulage so as to insure the greatest degree of safety to the employees? (15)

7. How do mine fires originate, and what precautions are necessary to prevent them? (10)

8. Give your reasons why different methods of mining are used and why one method will not answer for all mines. (10)

9. Describe by sketch some of the methods used in working incline seams. (15)

Mine Manager Examination.

Paper No. 5. Time allowed, three and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 60 per cent. of the allotted marks to pass.

MACHINERY.

1. What is a unit of work and how many are there in a horse-power? (5)

2. What care should be taken of steam boilers to secure the best results from their use? (10)

3. How may radiation from boiler pipes and engine cylinders be prevented? (10)

4. What is mean effective pressure? (5)

5. The diameter of the piston of an engine is 10 inches and the length of stroke is 15 inches. The engine makes 250 revolutions per minute with a mean effective pressure of 40 pounds per square inch. What is the horse-power of the engine? (10)

6. At a shaft 200 feet deep, there is a sump 250 feet long, 20 feet wide and 6 feet deep. If this sump fills in three hours' time, find the horse-power of the pump that should be installed to handle the water. (10)

7. A 300 horse-power engine has a cylinder 22 inches in diameter, and a stroke of 18 inches. When making 200 revolutions per minute, what must be the mean effective pressure (M.E.P.)? (10)

8. What weight will a double cylinder engine of the following dimensions lift (allowing one cylinder to overcome friction): Diameter of cylinder, 10 inches; length of stroke, 15 inches; average steam pressure on pistons, 40 pounds per square inch; engine shaft geared 5 to 1 on drum; diameter of drum, 5 feet? (10)

9. To what use is electricity applied in a coal mine? What are the names of the four electrical units in common use and explain their meaning? (10)

10. What in your opinion constitutes an efficient and safe hoisting appliance for a coal mine? Describe in detail from the foundation of the engine to the delivery of the carriage at the tipple. (10)

11. What classes of air compressors are best adapted to operate haulage locomotives? Give reasons. (5)

12. Using compressed air of 60 pounds gauge pressure, if there is required 1,100 cubic feet of free air for the operation of twenty-five 2-inch drills at sea level what quantity of free air would be required for the same work at an elevation of 5,000 feet above sea level where the barometer reads 25 inches? (5)

Mine Manager Examination.

Paper No. 6. Time allowed, three hours.

The value attached to each question is given in parenthesis. Candidates must obtain 60 per cent. of the allotted marks to pass.

LEVELLING.

1. Describe a levelling rod and its use. (15)

2. Describe an engineer's level and its use. (15)

3. Fill in the following level notes, showing the height of instrument and the elevation of each station. Stations are 100 feet apart: (20)

Station	B.S.	H.I.	I.S.	F.S.	Elevation.	Grade.	Remarks.

4. Draw a profile from the above notes, using a scale of 10 feet to the inch for heights and a scale of 100 feet to the inch for horizontal distances. Mark on the profile the number and elevation of each station. (20)

5. What is the average grade from Station 0 to Station 19? Show grade by line drawn on profile. (15)

6. How would you determine whether your instrument was in proper adjustment? (15)

Mine Manager Examination.

Paper No. 7. Time allowed, three and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 60 per cent. of the allotted marks to pass.

SURVEYING AND MAPPING.

1. On starting to make a survey underground, what instruments, tools and materials are used? State fully how you would proceed to make an underground survey. (10)

2. Why are stations invariably placed in the roof? (10)

3. In setting up a transit, how do you determine the exact place to set the instrument when the point is in the roof? (10)

4. In starting from a true base line OON, you turn an angle to the right 23 degrees 15 min. What is the bearing of this course? On the next station you turn an angle to the right of 87 deg. 10 min. What is the bearing of this course? Is there any way by which these bearings can be checked? (10)

5. A distance measured on a pitch of 35 deg. is 150 feet. What is the horizontal distance? (10)

6. Plot the following survey, reducing angles to corresponding bearings. This survey commences at Station O on an established base line which is true north and south, and the readings are as follows: (10)

Station 0-1	Right	31 degrees	15 min.	Dist., 590 feet.
Station 1-2	Right	1 degree	38 min.	Dist., 505 feet.
Station 2-3	Right	127 degrees	04 min.	Dist., 190 feet.
Station 3-4	Right	61 degrees	29 min.	Dist., 102 feet.
Station 4-5	Left	1 degree	58 min.	Dist., 190 feet.
Station 5-6	Left	5 degrees	25 min.	Dist., 600 feet.
Station 6-0				

7. Calculate by sines and cosines the bearing and distance from Station 6 to Station 0. (10)

8. How would you plot the mine workings of a pitching seam on a plan to be used by the pit boss? Give your reasons for such. (10)

9. What is the deflection of the needle in this locality? Why is the needle weighted? (10)

10. Why is it advisable to make a contour map before planning the development of a mine? (10)

Pit Boss Examination.

Paper No. 1. Time allowed, one and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 60 per cent. of the allotted marks to pass.

COAL MINES ACT.

1. What is the interpretation of "pit boss" as laid down by The Coal Mines Act? (5)

2. What are the provisions of The Coal Mines Act regarding an adequate amount of ventilation in a mine? (10)

3. (*a*) How often does the Act require the air current to be measured? (*b*) By whom measured? (*c*) When must the air reports be sent to the office of the Mine Inspector? (10)

4. What does The Coal Mines Act state with regard to the withdrawal of workmen in case of danger? (15)

5. State what dangers are met in approaching old abandoned workings and what precautions are necessary under The Coal Mines Act. (15)

6. What does The Coal Mines Act state about signals and manholes on underground planes which are self-acting or worked by machinery? (10)

7. What are the requirements of The Coal Mines Act regarding manholes on travelling roads where the produce of the mine exceeds 10 tons in one hour? (10)

8. What does The Coal Mines Act state about a person having charge of machinery in a mine where persons are lowered and raised by such machinery? (10)

9. What does The Coal Mines Act state regarding a supply of suitable timber? (10)

10. What are the requirements of the Act regarding the fencing of machinery? (5)

Pit Boss Examination.

Paper No. 2. Time allowed, two and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 60 per cent. of the allotted marks to pass.

VENTILATION.

1. Name the gases met with in mines, giving, also, the symbol and specific gravity of the same. (10)

2. What proportion of atmospheric air and carburetted hydrogen are necessary to form a highly explosive mixture? (10)

3. What are the most common causes of ignition of gases in coal mines? (10)

4. The ventilating fan of a mine is of ample capacity but the ventilation at the face of the workings is insufficient. What would be the probable cause of the fan's inefficiency in producing sufficient air at the face of the

workings? How would you proceed to overcome the difficulties or defects? Explain fully. (10)

5. A rectangular airway is 6 feet high, 12 feet wide, and 2,500 feet long; what is the rubbing surface in square feet? (10)

6. Which is the more effective, the exhaust or forcing fan? Give your reasons. (5)

7. In a gangway having a 7-foot collar, 12-foot spread, and 7 feet high, what is the area and what quantity of air is passing when the velocity is 375 feet per minute? (10)

8. The velocity of the air passing in a circular shaft 8 feet in diameter is 300 feet per minute; what is the quantity of air passing per minute? (10)

9. The water gauge is 1.5 inches, the quantity of air in circulation is 85,000 cubic feet per minute; find the horse-power in the air. (10)

10. Explain the principle discovered by Sir Humphrey Davy and embodied in the safety lamp. What is the standard size of wire gauze used in the Davy lamp? (5)

11. What instructions would you give in reference to the care and preparation of safety lamps before giving them out to the workmen and how would you instruct the workmen as to their use? (10)

Pit Boss Examination.

Paper No. 3. Time allowed, three and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 50 per cent. of the allotted marks to pass.

PRACTICAL WORK.

1. When would you consider that the coal in a seam is properly mined where blasting the coal is necessary? State your views fully. (10)

2. When the fire boss reports in the record book certain dangers that he has discovered during his examination, what would be your duty as pit boss? (5)

3. Assuming that falls of roof, slate, coal and sides are the cause of the greatest number of accidents in mines, what precautionary measures would you adopt as a pit boss to reduce their number? (10)

4. An entry is rising at the rate of 7 feet in 100 feet and the ventilating current of air is flowing up the grade where you are compelled to place a door on the pitch of said entry near its entrance, and the height of the door is equal to the height of the entry; explain how you would prepare the place so the door would close by gravity and show by sketch how door is placed. (10)

5. Make a sketch of an overcast. (10)

6. Show by sketch how you would timber a roadway having a bad roof and sides, also soft fireclay bottom that heaves. (10)

7. What method is the safest for using dynamite in sinking a shaft and what will give the least danger to life or limb? Explain fully. (5)

8. Describe a creep, its effect, and the precautions necessary to prevent and check it. (10)

9. A dam in a tunnel supports a vertical head of 80 feet of water; the sectional area of the tunnel is 70 square feet. Find the total pressure on the dam. (5)

10. Do you consider coal dust an element of danger in a non-gaseous mine? If you found much dust in the mine what precautions would you adopt to prevent any danger to life and destruction of property that might occur from its presence while mining operations were being carried on? (10)

11. What are the causes that lead to mine fires, not taking into consideration spontaneous combustion, and how would you guard against them? In dealing with mine fires what dangers are likely to arise to life provided care is not exercised by the persons dealing with them, and what precautionary measures should be adopted to insure safety? (5)

12. Explain in detail the causes of accumulations of fire damp, and the probable effects of allowing such accumulations to exist in a mine. What precautions should be taken to avoid such accumulations of gas? (10)

Pit Boss Examination.

Paper No. 4. Time allowed, three and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 50 per cent. of the allotted marks to pass.

MACHINERY.

1. What is the principle of the siphon and to what height can it be applied to raise water? How would you start the flow in a siphon? (10)

2. What is it that causes a pump to raise water through a suction pipe 20 or 25 feet? (10)

3. For what purpose are bearings bushed? What metals are generally used and why? (5)

4. What is a unit of work and how many are there in a horse-power? (10)

5. What is the horse-power of an engine with cylinder 20 inches in diameter, length of stroke 30 inches, making 50 revolutions per minute, with an average steam pressure of 30 pounds per square inch?

6. State the method you would employ in making an examination of the rope, cage, and safety catches in use at a coal mine. (10)

7. In laying out a siding or main parting where mechanical haulage is in use, what are the chief points to be considered with reference to safety, economy, and the speedy handling of the coal? (10)

8. Give a sketch showing various forms of rope capping. Which form would you prefer and why? (10)

9. Name the different kinds of safety valves and give the characteristics of each. (5)

10. If the diameter of the water cylinder of a pump is 10 inches and the discharge column is 150 feet in height, what would be the total pressure in pounds on the piston, disregarding friction? (10)

11. A pipe running full of water is one foot in diameter and is leading from the mine to a surface opening that is draining said mine of its water; the velocity of the water in the pipe is 4 feet per second, how many gallons of water would be discharged therefrom in one minute? (10)

Pit Boss Examination.

Paper No. 5. Time allowed, three and one-half hours.

The value attached to each question is given in parenthesis. Candidates must obtain 50 per cent. of the allotted marks to pass.

SURVEYING.

1. Give the order of the letters on the face of a compass and the reason for such arrangement. (15)

2. What is meant by the declination of the needle? (10)

3. What is the most suitable and accurate instrument for measuring distances? (10)

4. Where are stations in mine surveying generally placed and why are they so placed? (10)

5. In setting up a compass, how do you determine the exact place to set the instrument when the station is placed in the roof? (15)

6. Plot the following compass survey to a scale of 100 feet to the inch:

Stations 1-2 N. 15 degrees, E. 220 feet.
Stations 2-3 N. 40 degrees, E. 160 feet.

Stations 3-4 S. 12½ degrees, E. 300 feet.
Stations 4-5 S. 50 degrees, W. 140 feet. (20)

7. Find the bearing and length of the closing line from Station 5 to Station 1. (10)

8. How often should a mine be surveyed and mine plan brought up to date? (10)

Fire Boss Examination.

Paper No. 1. Time allowed, one and one-half hours. The value attached to each question is given in parenthesis. Candidates must obtain 60 per cent. of the allotted marks to pass.

COAL MINES ACT.

1. What is the interpretation of "fire boss" as laid down by The Coal Mines Act? (10)

2. What is the interpretation of "shotlighter" as laid down by The Coal Mines Act? (10)

3. Give a detailed account of the duties of a fire boss from the time he reaches the mine at the beginning of his shift until he leaves at the end of his shift. (20)

4. What does The Coal Mines Act state with reference to places not in the actual course of working? (10)

5. State fully the provisions of General Rule 8 regarding the use of any explosive in the mine? (20)

6. State the provisions of General Rule 7 regarding the use of safety lamps, also state under what conditions the use of safety lamps is required. (20)

7. What does The Coal Mines Act state regarding the appointment of stations at the mine? (10)

Fire Boss Examination.

Paper No. 2. Time allowed, two and one-half hours. The value attached to each question is given in parenthesis. Candidates must obtain 60 per cent. of the allotted marks to pass.

VENTILATION.

1. Name the different gases found in mines. Which are explosive and which non-explosive? State where you would look for them and how they are detected. (10)

2. If an explosion of gas occurred in your safety lamp, what would you do? (10)

3. What are the dangers arising from the improper care and handling of safety lamps by the workmen? (10)

4. In case the light in your safety lamp became extinguished while you were making an examination of a gaseous mine, how would you proceed and what provisions would you make for such emergency? (10)

5. What care and attention should safety lamps receive in the lamp room and how should lamps be inspected before they are handed over to the workmen for use? (10)

6. State the use of the water gauge and where you would apply it. (10)

7. What are the advantages of splitting air currents and for what purpose are regulators used? (10)

8. What are the anemometer, barometer and thermometer used for in coal mining? (10)

9. In an airway 10 feet 6 inches wide, 4 feet 6 inches high, we find the velocity of the air to be 300 feet per minute; what is the area of the airway, and how many cubic feet of air per minute are passing in the airway? (10)

10. Find the number of square feet of rubbing surface in an airway 4 feet high by 9 feet wide and 1,000 feet long. (10)

Fire Boss Examination.

Paper No. 3. Time allowed, two hours. The value attached to each question is given in parenthesis. Candidates must obtain 50 per cent. of the allotted marks to pass.

PRACTICAL WORK.

1. What, in your opinion, is a miner's first duty on entering his working place in the morning? Who should have preceded him there according to law? (10)

2. Name the precautions you would require a miner to take when about to restand a prop knocked out by flying coal from a blast? (10)

3. Show by sketch how to set props in a level seam. (10)

4. How would you set a single post on a pitching seam? (10)

5. State how you would commence to remove a large body of fire damp, and what precautions you would take. State what danger there may be in doing the work. (10)

6. State the character of brattices to be used in gaseous mines, and how should they be constructed? (10)

7. What are the principal things to be looked after in haulage roads? (10)

8. What dangers arise from lack of judgment in placing shots in coal mining? (15)

9. What is coal dust? State what dangers arise from the same when blasting is carried on where it is present; also, what you would do to prevent a possible accident due to the presence of coal dust. (15)

Fire Boss Examination.

Paper No. 4. Time allowed, one and one-half hours. The value attached to each question is given in parenthesis. Candidates must obtain 50 per cent. of the allotted marks to pass.

ARITHMETIC.

1. Multiply twenty thousand and seven by eighteen thousand seven hundred and four. (15)

2. Add the following numbers together: 768, 9476, 8, 93268, 396, 18, 64538, 9654, 9273642, 7. (15)

3. Divide 9878546 by 298 and work the answer to three decimal places. (15)

4. From 9350008 subtract 8370109. (10)

5. The velocity of the air in an airway 7 feet wide by 5 feet high is 750 feet per minute. What is the volume of air passing in the airway in an hour? (15)

6. From an entry 9 feet 6 inches wide and 5 feet 6 inches high, driven at the rate of 4 1-2 feet per day, how many cubic yards of material are taken out in five days? (15)

7. A shaft measures 7 feet by 15 feet and is sunk to a depth of 160 feet. How many cubic yards of material were removed in sinking it? What did the work cost at 15 cents per cubic foot? (15)

An underground lake, discovered in exploiting the Campine coalfields in Lower Belgium, is to be used as a source of supply for the country round about. The region is ill supplied with water. What available surface water there is, is often contaminated. The water from the underground lake is pure except for the presence of a small proportion of ferruginous matter. This can easily be removed. At present rain water is the principal direct source of supply.

The report of the Alaska Treadwell Gold Mining Company for the year ending May 31st, 1910, shows record results. The tonnage crushed was 744,226 tons. The yield per ton was $2.79, 58 cents higher than the average for the year previous. The cost of mining and milling per ton was $1.57, but the profit per ton was $1.22, almost twice as much as heretofore. The ore reserves are calculated at 5,899,364 tons.

ELECTRIC STEEL REFINING.

By D. F. Campbell (London).

(Paper read before the Iron and Steel Institute.)

The use of electricity for the refining of steel has now taken its place amongst established metallurgical processes, and many papers have been written on the subject of electric furnaces, but the author proposes to discuss briefly the general aspects of the subject, and what he considers the probable and possible developments in the immediate future in England. The electric furnace is at present used in various works for the refining of steel from the Bessemer converter in the manufacture of rails and all classes of railway material and castings, and more commonly in connection with the basic open-hearth process for the manufacture of various products of intermediate quality, castings and tool steel of all kinds. These are the purposes for which it has been most widely adopted, notably in America, Germany and France, although it is also used for melting and refining charges of cold scrap of cheap quality for the manufacture of tool steel and small castings, and its high efficiency is now generally acknowledged. The refining of steel that had been previously melted was the first use to which the electric furnace was applied commercially; but now that single furnaces have been producing over 200 tons a day for more than sixteen months, it is obvious that the field for the process has widened, and already many furnaces are in construction or operation in this country.

The author is of opinion that the electric furnace is especially suitable, and will be widely adopted, for any class of work in which raw materials of a high degree of purity are now used.

A wider application for rails and sections may occur when working in connection with the Talbot furnace, for the charge can be taken to the electric furnace as soon as the carbon is down, and the necessity of removing the sulphur and getting a teeming heat is avoided, as this is done in the electric furnace both economically and completely. Thus the capacity of the Talbot furnace is substantially increased, and this covers the greater cost of electric refining.

Again, in the case of a basic open-hearth plant, using 60 per cent. of molten pig iron and 40 per cent. of scrap, a 40-ton furnace might have 15 tons removed to the electric furnace for refining, and a similar charge put in every two hours. Thus the capacity would be increased, the quality improved, and, in addition, a reduction in the cost of raw materials can also be made in some cases, as a low quality of pig iron can be used.

Similar conditions occur when working in conjunction with an open-hearth plant for making castings, and a thoroughly dead melt and extreme fluidity can be obtained, while the commonest raw materials can be used, and refined completely. This gives economy both in the amount of gits and runners, and also in the reduction of wasters. Even in the case of foundries engaged in ordinary open-hearth casting work, in which the margin of profit is now exceedingly small, the electric furnace is considered necessary for an improvement in quality, while in a small foundry making light and intricate castings from crucible steel, an economy of several pounds per ton may be expected to result from the adoption of the electric furnace, judging from the reduction of the costs in works in Germany where crucible furnaces were replaced by this process.

There is little doubt that crucible steel, Swedish billets and products of intermediate quality, such as are used for the Sheffield trade and by tube-makers of Staffordshire and South Wales, can be economically replaced by steel refined by electricity, and made in Middlesbrough, Cumberland, or the larger steel works in the Sheffield and Rotherham districts.

The use of the electric furnace is not likely to become general for rail steel manufacture at the present time, except in cases where the conditions are exceptional. In certain cases, such as at South Chicago, it has been adopted for that purpose owing to the economic conditions, notably the scarcity of good Bessemer ores and the demand for better rails. The electric furnace in such cases may save Bessemer plants from the scrap heap, or, at any rate, prolong the life of present installations, and at the same time make it possible to produce rails of a quality better than the best open-hearth steel, thus avoiding heavy capital expenditure.

In the electric furnace, almost any degree of refining can be economically effected, and the removal of sulphur, phosphorus, and oxygen is especially easy. This is probably due to at least three causes:

1. The intense heating of the slag, which is the place at which refining takes place. Owing to this high temperature and the extreme fluidity of the slag, the rate of the refining reaction is very great, because the velocity of reaction rises very quickly for high temperatures, and not in direct proportion to the temperature.
2. The extremely basic slag that can be kept in a very fluid state, and the calcium carbide formed by the action of the arc on the calcareous slag, are especially advantageous for desulphurization.
3. The violent motion of the steel, which results from the convection currents produced in the bath, due to the two intensely hot areas caused by the arc below the electrodes, increases the volume of steel exposed to the hot and fluid slag area, and hence the rate of refining.

The usual procedure for the use of the electric furnace in connection with the Bessemer converter is to charge the steel, holding back all slag in the ladle, after putting on the bottom of the furnace, lime and mill scale or iron ore. This produces an oxidizing or dephosphorizing slag, which may be carefully skimmed or poured off. On the bath of steel carbon is thrown to carbburize to any required degree, and then a second highly basic and desulphurizing slag is added. The arc acting on the calcareous slag produces calcium carbide, which may combine with sulphur to form calcium sulphide. As neither gases nor air enter the furnace, and the conditions are almost completely reducing, no sulphates are formed, a dead melt is easily obtained, and when the slag is molten and the requisite heat obtained, the steel is teemed. In the open-hearth or any oxidizing furnace these reactions cannot take place so completely and efficiently.

With steel from the basic open-hearth furnace, the procedure is similar, but when the quantity of phosphorus to be removed is small, it is only necessary to use one refining slag for the elimination of sulphur and any small amount of phosphorus remaining. The usual practice is to put the carbon necessary for carburizing in the bottom of the furnace and then add the steel, and the basic slag materials. As soon as the teeming heat is obtained, the necessary ferro-alloys are added and the steel will be completely refined.

Another point of interest is the rarity of blow-holes in electric steel when properly made, and this leads to the question of the cause of these troubles. It is well known that any ingot of steel when placed in a vacuum evolves nitrogen, and this is about equally true whether it be made in the crucible, the Bessemer converter, or the electric furnace. Blow-holes contain nitrogen, but this is probably not the cause. It is far more probable

that they are due to the combination of oxides with the carbon in the process of cooling, and that the carbon monoxide so formed at a high temperature causes blow-holes in the cooling steel, and owing to the diminution of volume of the carbon monoxide on cooling, a partial vacuum is formed, and nitrogen is sucked into the blow-holes. In electric steel, oxides do not occur in any quantity, and consequently the prime cause of blow-holes is reduced.

Again, the quality of electrically refined steel is better than a material of similar chemical composition made in any oxidizing furnace. This is probably due to the reducing conditions under which it is finished.

It must not be forgotten in discussing these special qualities of electrically refined steel, that some inferior material has been made by incompetent melters or in ineffective furnaces, and that the electric, just as much as any other furnace, requires trained men, and most careful designing by metallurgists who have made a special study and had practical experience in this subject.

The question of the cost of applying this process, which must be considered before all others, is more difficult to discuss generally, owing to the great variety of conditions. The following are the chief points, all of which must be carefully considered in each particular case:

1. The possibility of saving in cost of raw materials, since the best qualities of steel can be made from impure raw materials. For example, in the case of refining steel from open-hearth furnaces in the South Staffordshire district, the use of local pig iron as compared with hematite iron would effect a saving of several shillings per ton owing to the high railway rates.

2. Possibility of increasing the output of present furnaces with improvement of product. For example, in the case of Talbot and other open-hearth furnaces, where a large expense is incurred in the removal of sulphur and getting a teeming heat, the steel can be advantageously transferred to an electric furnace for desulphurization and the output materially increased. The Talbot or other tilting furnace is especially satisfactory owing to the facility with which charges can be transferred to the electric furnace, whenever required.

3. The cost of power and possibility of using blast-furnace or coke-oven gas, exhaust steam, etc., will be the determining factor in regard to deciding whether, in the manufacture of steel, electric refining can be economically adopted. In the case of cheap power or valuable products scrap may be economically melted and refined in the electric furnace at a current consumption of 700 to 800 kilowatt-hours per ton, or if the price of power be high, the steel may be merely desulphurized and deoxidized, after melting and dephosphorizing in a basic furnace, with a power consumption of 100 to 150 kilowatt-hours per ton.

4. The possible reduction of capital expenditure at certain works where the present products are not sufficiently good for modern specifications. This may involve the entire re-organization of the works, but it is often cheaper and more efficient to add an electric furnace to a Bessemer plant, than to replace the latter by open-hearth furnaces.

The author does not wish to compare the different types of electric furnace in this paper, but the figures given are taken chiefly from Heroult furnaces in America, England, Germany and France, as this type has been far more widely adopted, and is used in larger units than any other, and single furnaces are now refining 250 tons per day. This furnace is similar to a basic open-hearth furnace, and seems to present more simplicity and to embody more of the desirable features of electric furnace design than any other, which, in the the author's opinion, are—

1. The best basic open-hearth design should be followed as closely as possible. A bottom homogeneous and solid and banks free from embedded electrodes are important, and above all simplicity of design.

2. All electric mechanism, in the form of generators, transformers, etc., should be entirely separate from the furnace, should work under ordinary conditions of standard electrical practice, and should be of standard design, so as to avoid all unnecessary risks and complications.

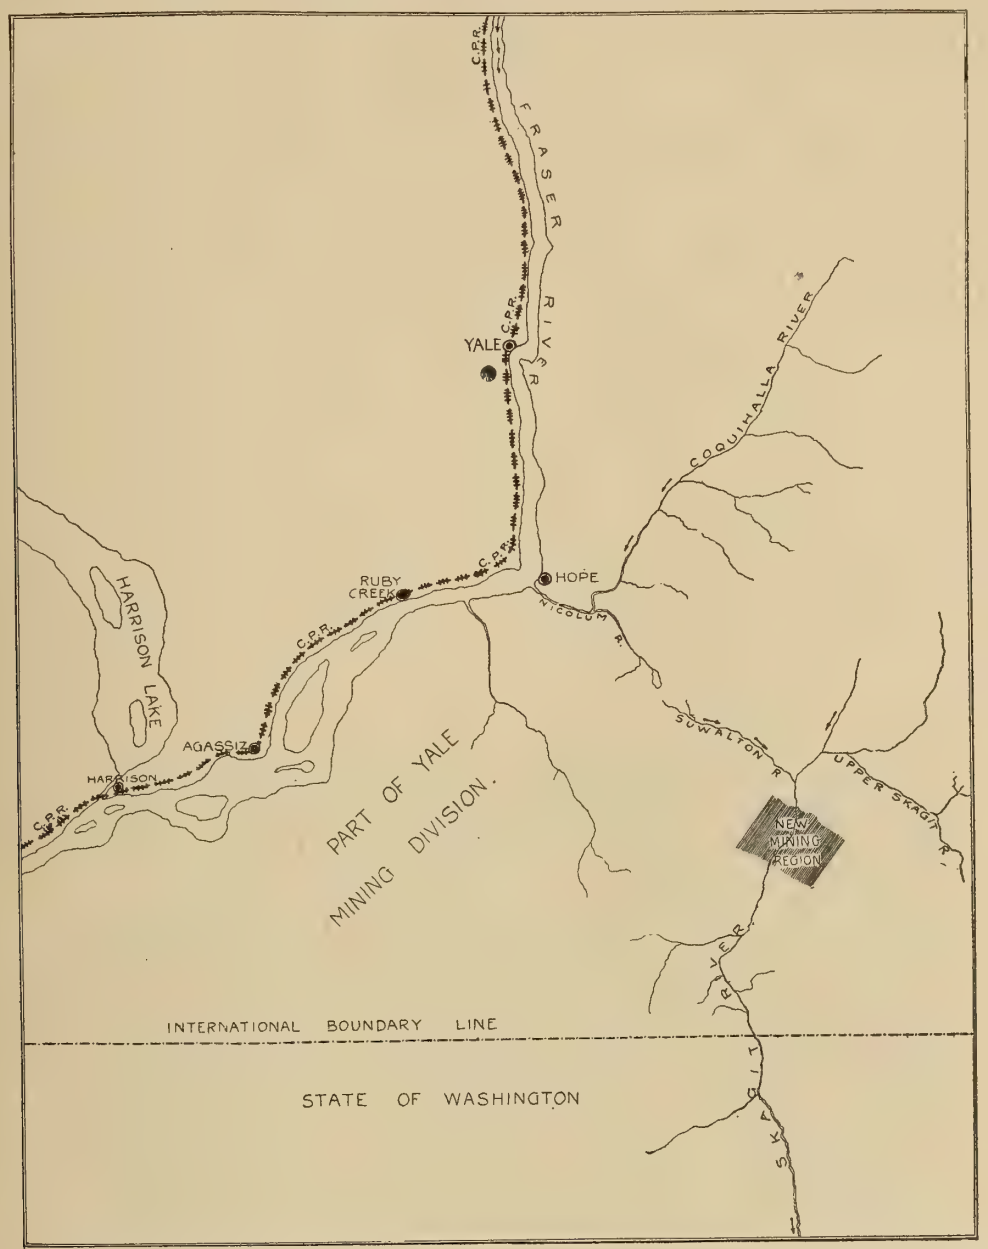
3. A high-power factor must be maintained, thus reducing the capital cost of machinery, and increasing the general efficiency of the power house.

4. To avoid excessive cost of refractory materials, the roof should be protected from the direct radiation of the arcs by the electrodes themselves, and the intensely heated area of slag should be as large as possible, to increase the surface of refining action. The Heroult furnace has an advantage over the open-hearth furnace in that the heat is applied to the centre of the bath, so that the banks are not quite so hot as the middle of the furnace and the wear of refractories is consequently less.

5. The heat should be applied to the slag, as in the basic open-hearth furnace, and the temperature of the slag should be maintained above that of the steel, which allows of extreme basicity and fluidity being obtained and gives an intensely active refining action. The conditions in the furnace should be oxidizing, neutral or reducing, at will.

The adoption of electric refining will cause some re-adjustment in the steel trade. As soon as the Sheffield steel smelter has become acquainted with the process, and accustomed to the working of electric furnaces, electrically refined steel will largely replace crucible steel. This has already occurred in Germany and America, where electric furnaces are used to make all classes of special and high-speed steels, the usual practice being to refine metal from a basic open-hearth furnace. Large crucible plants and small open-hearth furnaces engaged in the manufacture of small and intricate castings, such as motor-car parts, etc., may be replaced by electric furnaces, because the high degree of fluidity and dead melt obtained is especially advantageous.

In many cases manufacturers of axles, guns and tubes will abandon the use of Swedish raw materials, and refine steel made from low-grade ores, thus reducing the value of high-grade ore deposits and the quantity imported; for, by the use of electricity, Cleveland stone will produce a steel equal to the best hematite ores. The capacity of many Talbot and basic open-hearth plants will be increased and the quality of the product improved, while much of the power that is now going to waste will be utilized for steel refining.



From the electrical engineer's point of view, the electric furnace is an attractive load, as it is more or less in continuous operation. In the case of the Heroult furnace the power factor is 0.88 to 0.90, though much less with large induction furnaces. Single, two or three phase current of any frequency from 20 to 60 has been used without any difficulty, though it is preferable in the case of a two-phase system to transform to three-phase current, which can be done without additional difficulty or expense. The load factor will be most favourable, the usual practice when refining, for example, in a 15-ton furnace, being to use 2,000 kilowatts for 20 minutes after charging, while the steel is being heated. The current is then reduced to about 1,500

kilowatts for 45 to 75 minutes until the steel is ready for teeming. There is then an interval of ten to fifteen minutes during which the furnace is teemed, fettled and charged, which allows the transformers or generators time to cool before the period of overload commences. Current fluctuations occur for a few minutes, while there is an evolution of gas from the steel, which makes the bath boil up and touch the electrodes. This, however, is not sufficient to be objectionable, provided that the electrical machinery is properly designed for the purpose, and the extent of these variations is not so great as in the case of many rolling mills, the fluctuations in voltage being only about 3 per cent. in the South Chicago works, where a 2,000 kilowatt furnace has been working steadily since May, 1909.

The subject of electric steel refining is now receiving the attention of many steel makers, and it is hoped that these notes may lead to a stimulating discussion, not only of the many interesting and debatable questions in relation to the operation and design of these furnaces, but also of the more important and far-reaching economic and commercial problems which this process has created.

NEW MINING FIELD IN BRITISH COLUMBIA.

Vancouver newspapers have lately published accounts of a new mining field in which mineral discoveries, said to be promising, have been made during the last three or four months. The locality is in Yale mining division, which is a small subdivision of the district of Yale, the latter embracing a large area in the central southern part of the Province of British Columbia. The first locations of mineral claims in connection with the recent local excitement were made on what is known as Steamboat Mountain, but some of the later locations are in other parts of the Hope Mountains, scattered over the country for several miles around the claims first staked.

A newspaper account states that the field is easy of access, but now that snow has fallen it is difficult to get about the mountains and, of course, there can not be any effective surface prospecting done until next spring. The Steamboat Mountain field is described as being on the Skagit River about 40 miles south of Hope, and it is reached from Hope by the Sumallow River trail and thence down the Skagit. The last-mentioned stream flows south, into the adjoining State of Washington. Hope is on the Fraser River; it is distant from Vancouver 89

miles by C.P.R., and is 13 miles south of the town of Yale. Both Hope and Yale were centres of placer mining activity in the time of the great gold excitement of the Fraser 50 years ago.

No official information is yet available relative to the new field, for it has not yet been visited by either Federal or provincial officials of the respective departments of mines. It has been stated, though, in published accounts of the district, that the formation is andesite, with intrusive sheets of quartz porphyry, with visible free gold sometimes occurring in the latter. Generally speaking the ore is, so it is stated, of a milling character; assay returns from specimens have given value ranging from $15 to $200.

Of course, it is yet early to offer an opinion as to the merits of the new field, for little prospecting has been done, and no development of importance. It is not unlikely, though, that some payable mines will be opened, but this may not now be taken for granted. From the notice the field has already attracted, it is probable some of those who have acquired claims will develop them next season. Meanwhile this is only a preliminary intimation of the fact that this new district is receiving the attention of prospectors, and a suggestion of the possibility of its eventually being developed into a camp of some importance.

A MINING MACHINERY EXHIBIT AT WESTERN PENNSYLVANIA MINING EXPOSITION.

Thousands of daily visitors, including a large number of coal operators and mine superintendents, were afforded in their visit to the Jeffrey exhibit, a view of modern mining machinery, the feature exhibit at the Western Pennsylvania Mining Exposition.

No. 1.

This exhibit, occupying a space of over 3,000 square feet, reaching over 100 feet in length by 30 feet wide, was placed in the northwestern corner of Machinery Hall. It was designed and built entirely by the Jeffrey Manufacturing Company, Columbus, Ohio, being in the form of a model mine room, showing their latest and most improved types of mining machines, electric drills, as well as electric mine locomotives, in actual operation; and for all practical purposes as they would be operated in underground workings. Every operation is explained by the demonstrators.

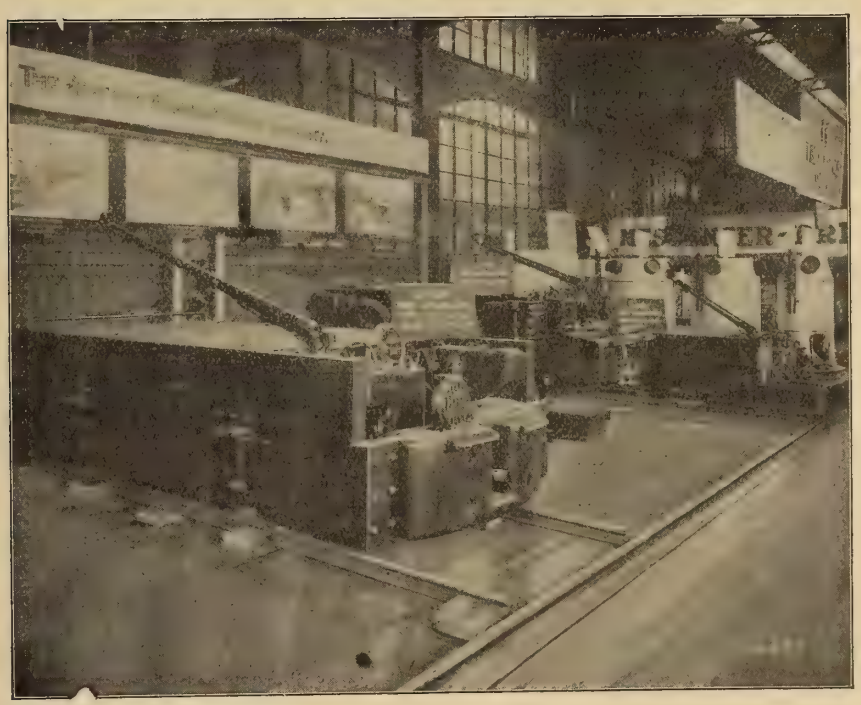
This mine room had a coal face 45 feet long and 6 feet high, constructed of large lumps of bituminous coal, which were brought from the Hazel mine of the Pittsburg-Buffalo Company. Practical demonstrations were daily conducted by the operators actually undercutting and drilling the coal and hauling it out of the room.

Photograph No. 1 shows a 28-A Short Wall Machine undercutting the coal across the face. At the left of this machine is a self-propelling steel truck, equipped with an automatic cable reel, which winds up the electric cable, as the truck moves out of the room. This machine unloads itself from the truck, makes the sumping cut at the right hand rib, from which point it cuts across the face until the left hand rib is reached. A steel feed cable wound on a power-driven drum at the front end of the machine pulls it across the face of the coal at a speed regulated by the hardness of the cutting and upon the nature of the coal or rock in which the cutting is done. Another cable which has no connection with the power, serves as a guide, holding the machine to its work and at a proper angle for its greatest cutting efficiency.

When the machine is finished in the room, it can be loaded on to the truck with its own power. Its narrow cutter-head and short length of machine from the coal face when cutting, make it especially valuable for cutting ribs and pillars of coal which have a tendency to come down when undercut.

Photograph No. 2 shows a Jeffrey A-5 Electric Augur Drill in operation, drilling a hole in the coal face. This drill is operated by an electric motor and will drill any material in which an augur drill will stand up. The photograph also shows another corner of the mine room with a 21-A mining machine equipped with a flame and gas-proof motor and starting box. In other respects, it is similar to the well-known Jeffrey 17-A electric coal cutting machine, being especially adapted for the hardest cutting encountered in any coal mine.

Another distinctive feature about the exhibit was the fact that it was the first public exhibition of any Jeffrey "Armorplate" Electric Mine Locomotive; designed and



constructed for surface or underground mine haulage.

Photograph No. 3 shows a view of a locomotive on the foreground. The complete frames on all sides are made of solid steel armor plate, which is made to special Jeffrey specifications, practically making this type of locomotive indestructible, as well as adapting it for the most severe service encountered in mine haulage.

Two other Jeffrey locomotives are also shown in this photograph, being built entirely of structural steel frames and equipped with motor capacity sufficient to slip the wheels and to stand continuous mine service. Each of these locomotives has mounted on the front end an independent motor driven crab, having a drum which holds 300 feet of 3-8-inch flexible steel rope. Daily demonstrations were made with the use of this crab device. A pressed steel car was hauled from one end of the room to the other end, demonstrating how loaded mine cars are pulled from the face of the mine room while the locomotive remains in the entry.

No. 2.

No. 3.

China's silver coinage in 1908 amounted to $24,498,653. In the same year India's silver coinage ran up to $58,773,220, whilst that of the United States totalled $12,391,777.

PERSONAL AND GENERAL.

Mr. Wm. Fleet Robertson, provincial mineralogist for British Columbia, has returned to Victoria from an official visit to the Portland Canal district.

Mr. W. F. Ferrier, of Toronto, has been visiting British Columbia. While in that province he investigated mining conditions and prospects in the Portland Canal district.

Dr. Eugene Haanel, Dominion director of mines, was in British Columbia late in October, in connection with the investigations his branch of the Canada Department of Mines is making relative to the treatment and profitable utilization of zinc ores, of which there are known to be large quantities in several districts of that province, especially in the Kootenay.

Mr. Elias Rogers, president of the Crow's Nest Pass Coal Company, was in British Columbia last month. After spending a short time at Fernie, southeast Kootenay, he paid a brief visit to Victoria.

Mr. Anthony J. McMillan, liquidator of Le Roi Mining Company, has returned to British Columbia from London, having reached Rossland during October.

Mr. W. J. Elmendorf, manager of the Portland Canal Mining Company, was in Victoria, B.C., early in November, after having been to Tacoma, Washington, with Mr. C. H. Dickie, president of the company, to discuss with the smelting company there matters connected with the treatment of silver-lead concentrate from the mining company's mine in Portland Canal camp.

Mr. W. H. Aldridge, managing director of the Consolidated Mining & Smelting Company of Canada, Limited, has returned to Trail, B.C., from a business visit to Toronto and Montreal.

Mr. Edmund B. Kirby, of St. Louis, Missouri, who during the time of the Gooderham-Blackstock control of those mines was general manager of the Centre Star and War Eagle, at Rossland, B.C., has returned to the United States from the Skeena district of British Columbia, where he had been examining mineral claims.

Mr. John McMartin, formerly of Cobalt, who is developing a gold mine at Sheep Creek, Nelson mining-division, B. C., went to San Francisco lately with his consulting engineer, Mr. W. Watson, of New York, in connection with the intended early erection of a stamp mill at the Mother Lode, Sheep Creek.

Mr. H. H. Webb, consulting engineer of the Consolidated Gold Fields of South Africa, is in Porcupine, and has assumed active direction of the Rea Mines properties, recently taken over by the Consolidated Gold Fields Company.

Mr. Frank G. Stevens, who for the past ten years has been mining in British Columbia and Mexico, is taking special work in economic geology and metallurgy at Queen's University. His present address is 95 Clergy Street West, Kingston, Ont.

The action brought by Mr. Clifford E. Smith against Dr. Milton L. Hersey, et al, has been dropped. The words of Mr. Smith's counsel sum up the position: "I feel in duty bound, as counsel, to say that I am convinced that there is nothing in the charges spread out on the record . . . The plaintiff authorizes me to . . . withdraw entirely in the fullest and freest and frankest way, all charges of wrong-doing or fraud against Mr. Brook, Dr. Hersey, and the other defendants in this action. Both action and counter claim were dismissed without costs.

Mr. J. B. Tyrrell brought to this office a large specimen of native copper found on the Coppermine River, Mackenzie district, draining into the Arctic Ocean. The specimen weighs about two pounds.

Mr. J. B. Tyrrell has opened up an office in Porcupine for the Anglo-French Company.

Twenty-one members were present at a dinner of the Montreal Branch of the Canadian Mining Institute, held on Friday, November 4th. Mr. John E. Hardman occupied the chair, and Professor Dulieux acted as vice-chairman. At the close of the dinner the following nominations were made for next year's council:—For president, Dr. F. D. Adams; for vice-presidents, Mr. Thos. Cantley and Dr. A. E. Barlow; for councillors, Messrs. Dulieux, Denis, and Bancroft.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay: Dominion Coal Output.—The output for October was lower than was anticipated, reaching only 329,000 tons. The decrease was occasioned by delays to shipping caused by bad weather conditions. The month was exceptionally stormy, and a succession of gales and rainstorms in the Gulf greatly hindered shipping.

Consequent upon the death of the manager of No. 2 Colliery, a number of changes have been made in the appointments of colliery managers. Mr. Alex. S. McNeill, formerly manager of Dominion No. 9 Colliery, is now manager of No. 2 Colliery; Mr. D. L. Mackay removes from No. 7 Colliery to become manager of No. 9, and Mr. P. Pendergast, formerly manager of No. 8, is appointed manager of No. 7 Colliery. Mr. Michael McIntosh is promoted from the position of underground manager at No. 5 Colliery to the managership of No. 8 Colliery.

A portion of the general office staff of the Coal Company has been moved to the general office of the Dominion Iron & Steel Company in Sydney. The heads of Coal Company departments now in Sydney are the general manager, the superintendent of shipping and general freight agent, and the comptroller. Mr. Plummer, the president of the two companies, recently spent a week in Cape Breton.

A correspondent in the United Mine Workers' Journal refers to Hon. Robert Drummond, the editor of the "Mining Record," in the following pleasant terms: "A bi-monthly jaundiced journal, edited by an old, unnatural, green-eyed prutresence of antiquity, who, with rotten heart and gangrenous brain, can jabber and grimace against all discontent, etc., etc." This is a fair sample of the language which the leaders of the U. M. W. A. cause have been in the habit of using in Cape Breton. Those who know the editor of the "Mining Record" and his power of repartee will await with interest the retort courteous. It is quite apparent that the feelings of the correspondent of the U. M. W. Journal must have been hurt in some way.

Reciprocity and Nova Scotian Coal Mines.—To those whose interests are bound up with the coal trade of Nova Scotia, the desire that is now being manifested in the West to deprive our coal mines of the protective duties under which they have grown and prospered carries with it the gravest menace. Reciprocity, so called, or the free admission of United States coal into Canada, does not present itself to the miner of Nova Scotia as a question in political economy. With him it is a question of existence—a matter concerning his bread and butter. The reasons that prompt the coal companies to oppose any change in the present tariff are concisely summed up in a letter addressed to

the Dominion Government by the president of the Dominion Coal Company, which is re-printed in full elsewhere in this issue of the Journal. The president of the Nova Scotia Steel & Coal Company also has written to the Government protesting against any change in the coal duties, and he makes the very serious pronouncement that reciprocity in coal with the United States would mean "not only the closing of the coal mines, but the ruin of the steel industry."

These letters cover so completely and definitely the reasons against a change in the coal duties, that it is unnecessary to detail these reasons here. Both Mr. Plummer and Mr. Harris oppose strongly the main argument of those who favour free coal, which is that the removal of the duties would give to Nova Scotia the New England coal market. Mr. Plummer writes: "Notwithstanding our efforts to sell coal in New England, our shipments have been steadily decreasing, and, even with concessions in price equal to the amount of duty, we have recently found that we could not secure contracts." This is the experience of the Dominion Coal Company, and, if that corporation cannot sell coal in New England, it is certain that no other Nova Scotia coal company can hope to succeed.

There is also a national aspect in connection with reciprocal free trade in coal with the United States which has not as yet been greatly urged. Canada, in comparison with her great stretch of territory, is but poorly provided with coal seams. In modern times no country has achieved greatness that has not been well provided with coal. The United States, Great Britain, Germany, and France are the world powers of to-day, and they are also the four greatest coal producers. One of the best guarantees for the continued prosperity of great Britain is that new coal-fields are being discovered even in that old and travelled country. This insures her against a shortage of that fuel without which her factories would be idle and her ships rust in port. The United States produces over three hundred million tons of coal per annum, and one coal company in the Union alone has a yearly output three times larger than the entire coal production of Canada. Few countries have been so favoured with natural stores of coal as the United States; but, even there, the tremendous depletion of the coal-fields is being viewed with alarm, and the suggestion has even been made that an export duty should be imposed on coal sent out of the United States—a measure, by the way, which was long ago taken by the British Parliament.

In a recent publication of the Canadian Geological Survey it was stated that the main stores of Canadian coal were situated at a distance from the great centres of population. But some day the population will move to the coal-fields, and these, as in all other parts of the world, will become the foci of industry and the great producers of national wealth. If Canada desires to become a self-contained and completely autonomous nation and to hold her ground with the great nation to the south of us, she must develop and yet conserve her own national stores of coal. Glancing at the map of the United States, nothing would appear more natural than that Nova Scotia coal should supply New England and that Pennsylvania coal should supply the territory round the head waters of the St. Lawrence. But, for various reasons, sometimes referred to as history, Canada is politically detached from the United States, and, in national affairs, boundaries and frontiers oftentimes take precedence of natural facilities. Even supposing that under free trade in coal the Nova Scotian mines secured a market in the United States as great or greater than the one they now have, would it be for the ultimate benefit of Canada to exhaust the only coal-field she possesses between the Atlantic and Saskatchewan to supply the homes and factories of a rival nation?

QUEBEC.

Buckingham.—The Buckingham Graphite Company is now operating its mill to full capacity, 60 tons of ore per day, producing about 5 tons of all grades of flake graphite. A ready market is found for the whole output in the United States. The mining plant and the mill are modern in all respects. A considerable profit is already being made.

The property, covering 400 acres, is situated 7 miles due west of Buckingham. During the coming winter the mill will be enlarged to a daily capacity of 100 tons of ore.

The same syndicate that controls the Buckingham Graphite Company, also owns and controls about 12,000 acres in the Townships of Buckingham and Lochaber. At a point 3 miles west of Buckingham a new 200-ton mill is in course of erection. It is hoped that this mill will be completed by May 1st, 1911.

The products at present being turned out are as follows:—

	Per Cent.
Crucible graphite	93 to 95
Lubricating graphite	85 to 92
Stove polish, facing, etc.....	70 to 80

These analyses indicate that the problem of separation has been solved. Everything about the re-organized venture is most encouraging. Much credit is due to Mr. H. P. H. Brumell, who has stuck to his guns through years of discouragement.

ONTARIO.

Cobalt, Nov. 7.—Within the past two weeks various strikes have been made or new developments have been made known that have changed the whole viewpoint of the Cobalt camp. The Lawson shows every evidence of coming back and several new leads have been struck on the Kerr Lake, which to all appearances, will for some time enable the Lewisohn Company to pay its ten per cent. per quarter.

The Northern Customs concentrator will add twenty stamps to their battery in order to handle the 50 tons per day of milling ore from the Cobalt Townsite. A year ago the Townsite appeared to be moribund; to-day it is shipping almost every week. A number of good surface finds have been made round the shaft near the Buffalo line and sufficient milling ore put in sight to make a year's contract with the Customs mill.

In a recently issued statement of the Trethewey Cobalt it is shown that the company had cash in the bank and due from smelters, $207,740.73, ore sacked at mine, $12,847, leaving $220,587 after providing for dividends and all expenses.

The long drawn out suits between the Crown Reserve Mining Company and W. J. Parker and A. G. Fowler Ross, members of the promoting syndicate, have been settled out of court.

In spite of the unfavourable interpretation given to the annual report by various interests, the Kerr Lake Mining Company has declared its usual dividend of 10 per cent. per quarter to be paid on Dec. 15.

The physical condition of the Kerr Lake mine has materially improved since the issuance of the annual report. From the No. 3 shaft in the diabase entirely new ground has been opened up at the fifth level and good high grade has been discovered. Under Kerr Lake to the east towards the Drummond six new leads have been cut, some of them carrying good ore. This is practically unexplored ground, as the company would not drift under water until they had attained considerable depth.

The Thelma Gold Mining Company has let a contract for the sinking of a shaft to the depth of 75 feet. Some spectacular gold has been taken from this claim, which is situated between Elk Lake and Earlton on the T. & N. O. Railway. The company is formed of Montreal merchants.

The Bailey Cobalt has run into a shoot of rich ore on the 232-foot level in the west drift. They are also mining from the Cobalt Central workings on the other side of the line in order to reach the Bailey vein at the fourth level. All the ore is being milled at the Central mill with, it is understood, good results. Four and a half tons of table concentrates have produced 1,645 pounds of jig concentrates and 94 pounds of bullion.

After working their optioned claims at Hangingstone Lake in the Gowganda district, the Temiskaming and Hudson's Bay Company has decided to make the first substantial payment. It is understood that development so far has been quite satisfactory.

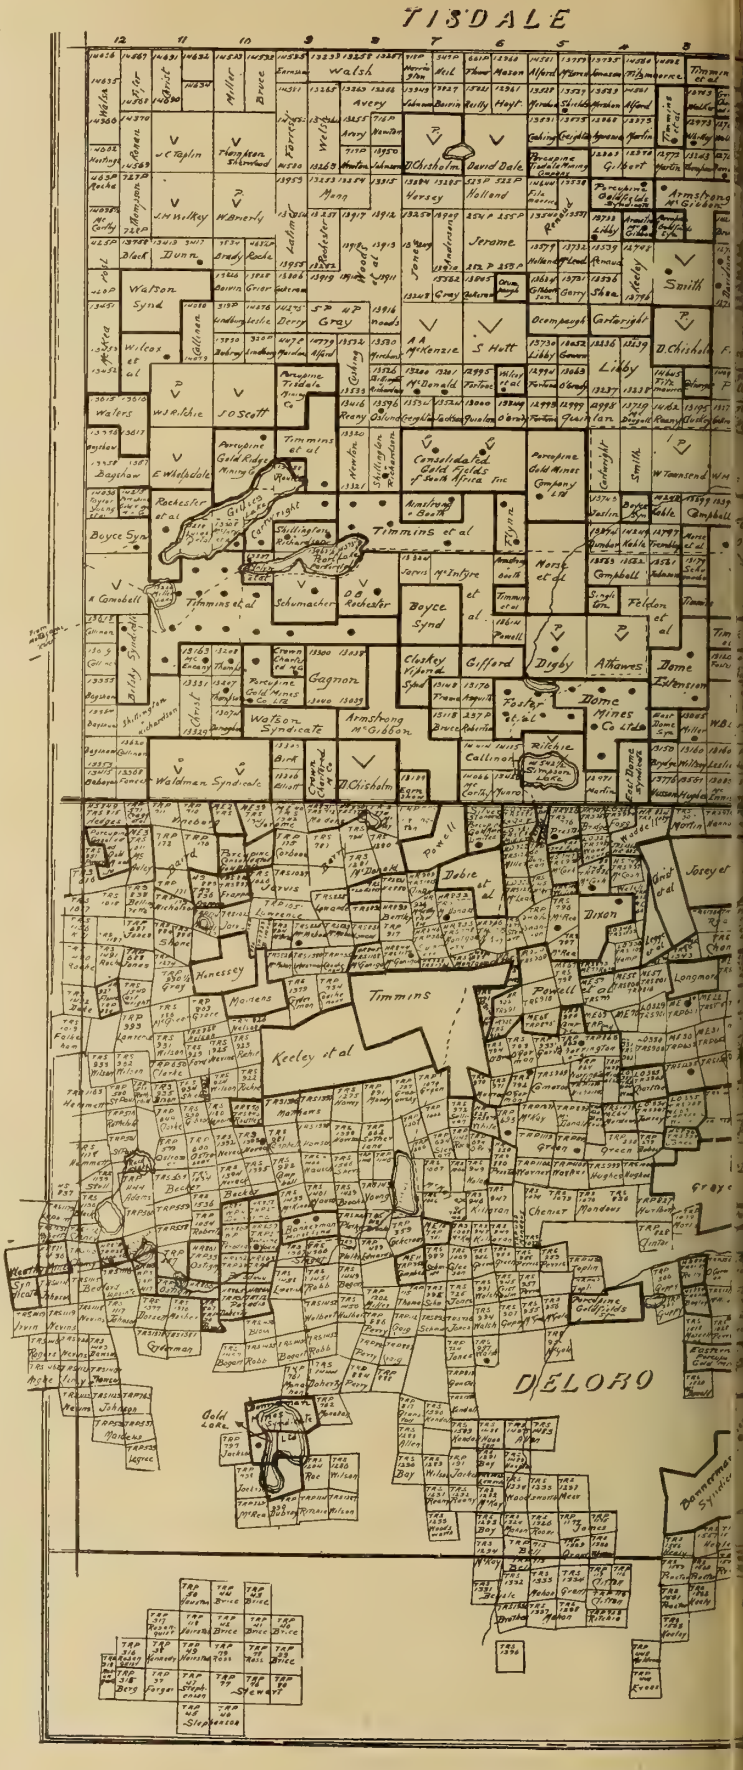
At the City of Cobalt's annual meeting it was definitely decided that no dividend should be paid. The balance for 1909 was shown as $179,900. This year 361 tons have been shipped, six cars of screenings and low grade, and six cars of high grade and concentrates.

The mill report of the Buffalo Mines for September reads: Mill ran 556 hours, ore milled, 3,718 tons; average assay per ton before milling, 28,35; ounces silver recovered, 82,639; milling expenses, labour, $3,450; power, $1,414.43; ounces of silver paid for during the month, 120,695.

The Drummond has commenced to mine again. A contract has been let to sink a 100-foot shaft near the Hargrave line to catch the Hargrave vein, which has been traced definitely on to their property. The Hargrave has mined high grade ore within 40 feet of their boundary. It has also commenced to ship and has sent out 400,000 pounds of low grade ore in one week.

That there is an increased demand for Cobalt's ores is proven by the number of firms who are now striving to obtain contracts or have got them. The Swansea Smelting & Refining Company of Toronto is now definitely an dactively in the market, and several other new incorporations are looking over the situation.

On their south Coleman claim the Black Consolidated Mines have commenced work again. They are sinking again on their massive smaltite vein.



At 200 feet, forty feet from the bottom of the No. 8 shaft, a body of high grade ore was encountered on the Lawson. Now it has been driven on for 20 feet and the ore of the richness seen on the surface averages nine inches of solid metal. So far all ore bodies on the Lawson (with the exception of No. 2) had pinched out at the 88-foot level. No. 8 vein, in which the good ore was found at depth, was no exception. There are so many and so rich veins on the Lawson that the indication that they may make at depth alters the complexion of the Lawson situation very greatly.

The bullion shipments for the camp read:

	Ounces.	Value.
O'Brien	288,406	$153,928
Nova Scotia	120,483	71,670
Temiskaming	86,691	42,629
Buffalo	98,012	50,999
Crown Reserve	15,931	8,623
La Rose	44,057	23,339
Cobalt Gem	10,000	5,800
Beaver	3,168	1,820
Colonial	1,008	623
	668,556	$359,431

Since the O'Brien plant commenced operations they have made fourteen bullion shipments worth $153,928. Last month, the most successful in the history of the mill an extraction of 93.4 per cent. was obtained, the heads averaging 40 ounces. On an average 20 tons of ore per day are treated and the only ore shipments made are of jig and table concentrates and an occasional bunch of high grade. All this winter ore from the various shafts will be trammed to the central shaft near the mill and raised there, instead of being transported by surface cars. Some interesting new ore bodies have been opened up at the old No. 1 shaft.

At the Cobalt Provincial mine 200 feet of continuous ore has been opened up at the 175-foot level. The excavations for the foundation for a small 40-ton mill have been commenced near the shaft and camps to accommodate 40 men are being rushed up.

The old shaft house built by the Government has been dismantled, as this section of the ground will be worked from the Savage shaft. A car of high grade ore has been assembled and will be shipped before the end of the year.

GOUDIE'S MAPS
OF
THE PORCUPINE GOLD FIELDS.
ISSUED BY A.C. GOUDIE.
621 TRADERS BANK
TORONTO.

The statement of the Temiskaming which accompanied the dividend cheques shows a profit for the nine months of the present fiscal year of $579,364.30. The profits for the quarter ended October 31 were $284,762.93, or at the rate of $94,920.98 per month. Of the 1,531,096 ounces produced, 1,104,532 were obtained by hand sorting and 426,564 ounces recovered at the mill. At the 500-foot level it is reported the No. 1 vein has been drifted on for 162 feet and silver values have been encountered throughout interspersed with shoots of rich ore.

South Lorrain.—It is most likely that by the end of this month or the beginning of next the companies in the camp will be taking power from the Mines Power Company. Two 375 h.p. transformers have been moved from the Kerr Lake substation to South Lorrain and are now being set up. Service lines to several of the mines have already been run, so that it is probable that power will not be much longer delayed.

The Lewisohns have taken up their option on a large block of Wettlaufer stock, but it is understood not sufficient to give them control. From the 190-foot level a winze has been sunk to the 250-foot and the shaft will be put down to that depth to connect. From the winze level another winze has been sunk 22 feet and at the bottom of this the ore has widened out into six inches of 3,000 ounce. Three or four cars, two at least of high grade, are being shipped before the waterway transportation is closed up.

The Keeley mine also expects to ship before the closing of navigation. It is now mining good ore at the 100 foot level and has struck good high grade at the 170 foot.

Porcupine.—Development on the purchase of the Gold Fields Consolidated of South Africa has to date been most satisfactory, and it is stated on expert authority that it is now the third best surface showing in the camp. Free gold shows in some places sensationally for 220 feet in a two and a half foot vein and in the shafts sunk to date the values are equally as good at the depth attained as on the surface.

The British Canadian Power Company, at the head of which is Mr. A. E. Wallberg, of the Mines Power, has now secured control of the undertaking to run a railroad into Porcupine and work has already commenced, as the country offers few engineering difficulties, it is expected that it will be of use some time next summer.

The winter trail to Porcupine will be opened up in a few days. All navigation has ceased on the lakes and sleighs are running on the winter roads. Directly it is known that the winter roads are good for heavy freight there the trail will be almost as thronged as the Gowganda trail two years ago.

Till supplies can be taken in over the winter road the Dome Mining Company and the Timmins have laid off all the men they can. The stock of provisions laid in before the break up last spring has now run very low and the expense of replenishing them at once caused several properties to close down for the time being or reduce their staff.

Operations have been resumed on the Foster near the Dome and machinery will be taken in as soon as transportation allows. It is the intention of the management to sink two shafts 600 feet apart.

The only machinery to be taken in over the summer routes was the boilers and hoist of the Porcupine Gold Mines, the New York company working the Vipond or Flynn claims. They were drawn up the Porcupine River in big pointers drawn by gasolines. A small mill went with them.

In readiness for the time when transportation is good, the Dome Mining Company has ordered a 12-drill compressor from the Canadian Rand, while the Timmins people have ordered their mill equipment from the Allis-Chalmers Company.

Mr. A. B. Stewart, who was formerly at the Nova Terra mine in Fabre Township, has sold the Carson-Hennessey Walker claims to English capitalists. There are many large English interests in the north country now bidding eagerly for promising claims, and Mr. Stewart has options on 60 for the London market.

With the near approach of better transportation much greater activity is apparent in the townships on the border of Porcupine. In Langmuir, Carmen, Thomas and Deloro there are many

men now working and many strikes reported, some of which are authentic. So far it has been almost impossible to do systematic work as it required half the labour of the gang to provide the camp with necessaries.

BRITISH COLUMBIA.

Exhibits of minerals from Kootenay, Boundary, Kamloops, and Nicola Valley districts have been made during recent months at several annual fairs. The largest display was at the Interstate Fair held at Spokane, Washington, where the display of specimens of minerals from British Columbia was particularly large and attractive. It has been claimed that recent displays were the best ever made of collections of minerals from this province, but it is probable those making this claim lost sight of the really large and thoroughly representative collection from British Columbia included in the unusually excellent exhibit of Canadian minerals made at the Alaska-Yukon-Pacific Exposition held at Seattle, Washington, last year. In quantity, variety, and quality, the splendid exhibit got together last year by Mr. R. L. Broadbent, of the Geological Survey branch of the Dominion Department of Mines, without doubt excelled any other collection of mineral specimens from British Columbia yet made. But having conceded this, as a simple matter of fact, it may be said that good exhibits were made this year at Nelson and Spokane, and in smaller measure at Vancouver. There was practically no competition at the last-mentioned place, but at the Spokane fair, held recently, conditions were the opposite. From a published account of the latter it has been ascertained that the British Columbia display included mineral specimens from 148 mines; that from Idaho, 110 mines; from Montana, 38 mines; from Alberta, 11 mines; from Oregon, one mine; and from various other sources, 29 exhibits. The general excellence of the British Columbia exhibits is indicated by the number of awards made to them. Of seven silver cups offered for competition, four were won by British Columbia, while the exhibits from this province were awarded twelve of the 22 silver medals offered. Most of these awards were made to exhibits from West Kootenay, ores from which constituted by far the greater part of the British Columbia collection. The cup for the best mineral display at the fair was won by British Columbia; other cups were won as follows: By Ainsworth, for silver and lead ores; by the Lucky Jim mine, Slocan, for zinc ores; and by the Crow's Nest Pass Coal Company, for coal. Among the exhibits awarded silver medals was one of nickel-cobalt ore from East Kootenay, and one of gypsum from Nicola Valley. Medals were also won by the following British Columbia mines: Nugget, Sheep Creek; Lucky Boy and Arlington, Erie, Eureka, Eagle Creek (all in Nelson mining division); Iron Mask, Kamloops; Standard, Silverton camp, Slocan; Highland, Ainsworth; Centre Star-War Eagle group, Rossland; Granby, Boundary; and Copper Chief, Trout Lake. Montana, Idaho, and Washington States each won a silver cup, while silver medals fell to those states in the following proportions: Montana, one; Idaho, five; Washington, four (including one to the First Thought mine, at Orient, which ships ore to the smelteries at Trail and Grand Forks, both in British Columbia).

Ymir.—There is now more activity in this part of Nelson mining division than at any previous time for years. Among the active mines are the Yankee Girl, which has shipped much ore during the last two years, Wilcox, Dundee, and several others. It has been reported that the old Ymir mine, formerly a dividend payer, is to be re-opened, and development at lower levels than those already worked to be undertaken.

Rossland.—Ore production is being well maintained at the Consolidated Mining & Smelting Company's Centre Star-War Eagle group of mines, and in less quantity at those of Le Roi No. 2, Limited. Among the smaller properties an encouraging feature is the recent finding of a fine shoot of ore of good value in the Blue Bird mine.

Slocan.—The mines that were deprived of railway transportation facilities last summer by the burning of many trestles and bridges of the Kaslo & Slocan Railway, have not yet resumed ore production on a normal scale, but some are making provision for the shipment of ore soon. Those chiefly affected are the Whitewater group, Lucky Jim, and Rambler-Cariboo. As the Whitewater mines shipped little crude ore, the great bulk of their product being concentrates, they must await the building of a concentrating mill, to replace that destroyed by fire in July, before they will again be in a position to make shipments. Mines situated near Sandon, which are provided with an outlet for their products over the Nakusp & Slocan Railway, are being operated as usual. In the Slocan Lake part of the district there is little change to note.

Lardeau.—There is an improved outlook for more development and production in this district, which has been neglected of late years to a considerable extent. It has been announced that the Ferguson Mines, Limited, an English company which has for years worked the Silver Cup and Sunshine mines with little intermission, sending out about 100 tons of high-grade silver-lead ore monthly, will again also work its Nettie L. mine, situated near Ferguson. Preparations are being made for a resumption of ore production at the Beatrice mine, near Camborne, Lardeau mining division; while reports are to the effect that several other properties in Lardeau division, and still others in Trout Lake division, will also be worked during the ensuing winter.

Similkameen.—In addition to the good progress made in Hedley camp, where is situated the Hedley Gold Mining Company's dividend-paying Nickel Plate mine, there is gratifying advancement in connection with the development of the coal resources of the Similkameen. The output of coal from the Princeton colliery is being steadily increased. At Granite Creek, the Columbia Coal & Coke Company is putting in a power plant and making other provision for the development of the several coal seams on its property. The Osoyoos Coal Company is prospecting its coal measures and opening coal reported to be of good quality and in considerable quantity.

Nicola.—Coal mining is becoming a more and more important industry in Nicola Valley as time passes. The Nicola Valley Coal & Coke Company is the only comparatively large producer of coal at present operating in the district, but development of other properties than that of this company is being steadily advanced. Railway construction is being proceeded with, the chief object in view being the connection, by as direct a route as shall be found practicable, of this fuel-producing locality with the Boundary mining camps which are looked to as an eventual market for much coal and coke from Nicola Valley. The metalliferous mineral resources of the country about Nicola have not yet been largely developed, but it is believed copper mining and smelting will yet be added to the industries of the district.

Coast.—While ore production continues small in this district, there is much work being done, so that it is reasonable to look for a much enlarged output within a year or two. At the Britannia mine, on Howe Sound, exploration of the big ore bodies is being continued, though only a restricted production of ore is being made while the price of copper remains low. At Green Lake, in about 30 miles from the head of Howe Sound, some large copper showings are being exploited. On Vancouver Island mining is chiefly for coal, and a greatly enlarged output of this mineral is planned for the early future. Texada Island has two valuable mines in the Marble Bay and Cornell, both of which have been producing fairly large tonnage of copper-gold ore of good average value. Lasqueti and Valdes Islands continue to have attention, development being in progress on both. Farther north, on Princess Royal Island, a locality in which some Maritime Provinces people were interested from five to ten years ago, a syndicate, including several Vancouver city men, is about to reopen a mining property. Other Coast dis-

tricts are dealt with under the several following heads:

Portland Canal.—The lower adit at the Red Cliff mine had been driven 1,013 feet from its portal by October 6. It is expected that before the end of November it will be under the ore cut in the upper adit about 300 feet vertically above the lower working. In the upper adit there is what has been described by the manager of the company as a chamber of chalcopyrite, 8 by 8 by 10 feet, opened some months ago at 80 feet in from the portal of the adit. The Red Cliff Company has been operating since May a Canadian Rand 10-drill compressor, which was hauled over the snow last winter, the distance from the landing at Stewart to the claim being about 12 miles. Steam for power purposes is supplied by three 60 h.p. boilers, which, as well as an air receiver and 6,000 feet of 20-pound tram rails, was hauled in last winter. Other equipment at the mine includes a Canadian Westinghouse generator, belt-driven by a 25 h.p. Comstock engine and having a capacity of 250 electric lights. A trial shipment of 3,028 pounds of Red Cliff ore, sent recently to the Tyee Copper Company's smeltery, gave a net return at the rate of 20 ounces per ton.

On October 8th the first trial shipment of high-grade silver-lead ore made from a mine in this camp was sent by the owners of the Lordigordy mine, of which Mr. H. B. Williams is manager. It consisted of four tons, practically one ton from each of four open-cuts. A local assayer's sampling gave a value of $220 per ton in gold, silver and lead. It is probable this ore will be treated at Trail.

Skeena.—Reports from reliable men concerning the occurrences of silver-lead ore in various parts of the district about Hazelton indicate that there is much promise of a productive mining field being opened there as soon as the Grand Trunk Pacific Railway, now being constructed, shall provide the transportation facilities requisite for conveying in the machinery and supplies, and carrying out the ore to smelting points. In the Babine range, east of Hazelton, development work has already been done on two or three properties, with results that seem to warrant the expenditure of more money when the cost of transportation shall be much less than now.

Atlin.—Beside the Engineer or Northern Partnership group of gold-quartz claims, situated on Taku arm, there is the Gleaner property, from which 75 sacks of free-milling quartz, believed to contain high gold value, reached Vancouver in October. Those interested in the Taku arm gold-quartz claims are confident profitable mines will be developed there.

Queen Charlotte Islands.—Not many particulars of mining work on the Queen Charlotte Islands have been printed in Coast newspapers lately. It is known, though, that development work is being proceeded with on both gold and copper claims on Moresby Island of this group, while in the coal measures of Graham Island prospecting is also in progress.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

Cardiff, Wales, Nov. 8.—Wild scenes were enacted in the disturbed colliery districts to-night where thirty thousand miners are on strike. Bands of youths, supported by women, stormed the colliery buildings and looted the stores in several towns, scattering the goods in the streets. The police, who were largely reinforced during the day, attacked the mobs with their batons, the rioters replying with showers of stones.

More than one hundred men were treated at the local hospital for scalp wounds. A number of the police also were injured, but they succeeded in getting the upper hand. Police reserves and troops arrived quickly at the scene of the greatest disturbances, and have been posted in the storm centres. They are prepared to prevent further disturbances, and should the strikers maintain their defiant attitude bloodshed is anticipated.

Mr. Winston Churchill, the Home Secretary, has offered his services to compose the differences between the men and their employers.

Cardiff, Wales, Nov. 9.—The action of the authorities in rushing troops and London police to the mining districts, where strike riots occurred last night, overawed the strikers, and the situation appeared to be well under control to-day.

GERMANY.

Statistics of the petroleum import trade of Germany for the first eight months of the present year show that in all 849,398 tons of petroleum were imported, as compared with 815,054 tons in the corresponding period of 1909.

ROUMANIA.

During August the Roumanian petroleum refineries treated 109,166 tons of crude oil, from which 18,769 tons of benzine, 26,394 tons of illuminating oil and 2,800 tons of lubricating oil were obtained. The remaining residues and coke amounted to 59,100 tons.

SOUTH AFRICA.

A cablegram from Johannesburg states that during September the mines of the Rand alone—that is, excluding outside mines—crushed 1,835,647 tons. The average yield per ton was 28s 3d, working costs 17s 11d, the profit per ton 10s 4d and the aggregate profit £942,330. In spite of the fact that September was a 30-day month the tonnage crushed was slightly more than for August, with an increase also in the daily average profit as compared with that month.

Johannesburg.—Shaft-sinking on the Springs' Mines is proceeding slowly, owing to the bad condition of the ground and the large amount of water which still percolates through the dolomite formation.

The Brakpan Mines, Limited, will start milling operations early in 1911. Good progress is being made with the equipment of the mine. Developments continue to show a good grade of ore, the reserves being now estimated at 1,503,135 tons, of an average value of 6.5 dwts.

A small test crushing has taken place at the Benoni mine, the machinery working well. It is expected that the mill will start crushing in April. The rumour of an intention to increase the capital of the company is denied. The cause of the recent fall in Benonis is unknown, but it is said to be due to a change of ownership in a large block of shares acquired under the recent reorganization scheme.

The oil shale deposits in the eastern districts of the Transvaal are causing considerable stir. In the Wakkerstroom district it is reported that the shale yields 90 gallons per ton, and in Ermelo 30 gallons per ton. The extent of the shale-bearing area is at present unproved.

RHODESIA.

The total output of gold from Rhodesia for the month of September is cabled as 42,499 ounces, valued at £178,950, as against 45,458 ounces, valued at £191,423, in the previous month. This is a decrease on the month of 2,959 ounces. In explanation of the further falling off in the output the British South Africa Company states: "The number of producing mines decreased by 37 in consequence of the fact that several mines hitherto worked on a small scale by individuals have developed so satisfactorily that they have been taken over by large companies and are now closed down pending the erection of larger milling plants." There were 152 gold producers during September. The output of other minerals was: Silver, 16,848 ounces; lead, 62 tons; coal,

16,362 tons; copper, 18 tons; chrome ore, 1,334 tons; asbestos, 25 tons.

WEST AFRICA.

The West African Chamber of Mines states that the gold yield of the colony for September was 11,497 ounces, valued at £47,746, a decrease of 2,424 ounces, or £9,967, compared with the preceding month.

UNITED STATES.

Los Angeles, Cal., Nov. 1.—The opening bids by the harbour commissioners of San Francisco last week for the supply of fuel oil for one year revealed the fact that the Associated and Union-Independents have sent the price up to 85 cents per barrel for crude oil at bay points. The offer is generally regarded as the serving of notice on all consumers that important contracts will not be filled below this point. There are rumours of an understanding between the Associated-Union-Independent interests and Standard, by which the price of oil will be kept at a point not lower than this price.

Cripple Creek, Col., Nov. 1.—A partial list of dividend-paying mines—that is, owning concerns—has been compiled, which shows that twelve properties, now actively working, have paid dividends to stockholders within the last few months. This list of twelve includes several close corporations.

Cripple Creek, Colo., Nov. 3.—To-day will mark the commencement of Cripple Creek's new era—an era that is expected to stretch out for at least another 20 years, during which time the district will mine and ship as much high-grade ore as it did when its ore bodies were new to the world and the miner had but to remove the surface rock to reach it. The deep, rich mineral zones of the camp are almost within reach of the miner—will be before the end of the day. The first water of the pent-up underground courses will be released through the Roosevelt drainage tunnel and in another 48 hours it is thought that the El Paso lower levels will have been drained and a large force of miners actually breaking rock on the 900-foot level. Less than six feet of rock remain between the bottom of the shaft and the drainage tunnel, which the churn drill will shortly penetrate and the water will be finding its way out at the rate of thousands of gallons a minute.

In another week, unless unexpected obstacles prevent, the tunnel will reach the main water course, when all the mines affected will enjoy the same good fortune as that upon which the El Paso will enter within a few hours. Between the tunnel breast and the main course there are estimated to be 72 feet, which, according to the progress the tunnel has been making of late, should be removed in six days, when a flow of water will take place such as has probably never occurred in a mining camp before, and it means that a new Cripple Creek will arise—as great, as profitable and as wonderful as when it rejoiced in the glory of its first discovery.

The tunnel, which was begun three years and a half ago, is into the mountains a distance of 15,503 feet, having gained 386 feet last month, which is the best record yet made.

Whether or not the tapping of the water course, to which the tunnel is drawing near, will drain the properties of the eastern end of the district, is a question, as it is believed that two separate and distinct underground lakes or channesl are separated by a hogback between Beacon and Bull hills. Should this condition exist, the tunnel will be extended on to the eastern section of the camp, but in the meantime the mines on the west side of the hogback, among them many of the larger producers, will be getting the benefit of the opening of one of the waterways and the output of the district, it is claimed, will be greatly increased before the other lake is tapped.

Trinidad, Col., Nov. 8.—Between 50 and 70 men are believed to be entombed in mine No. 3, of the Victor American Fuel Company, at Delagua, twenty-two miles northwest of Trinidad, as the result of an explosion to-day.

Fifty men came out unharmed through mine No. 2, which is connected with mine No. 3. According to reports to the mine officers, those men did not even know there had been an explosion in No. 3. If this report is true, the explosion, which caved the entrance to No. 3, did not extend far into the mine, and it is hoped that the men within the working are unharmed.

Boston, Mass., Nov. 5.—The shareholders of the Nevada Consolidated Copper Company, at their annual meeting held in Portland, Me., re-elected last year's board of directors with the exception of President James Phillips, jr., and C. Hartman Kuhn, who were succeeded by S. R. Guggenheim and J. M. Steele.

The annual report of the company, as presented to the meeting, gave the output of the company for the fiscal year ending September 30, 1910, as 62,772,342 pounds of refined copper, which was produced at a net cost of 6.42 cents per pound. The net profit for the year was $3,580,787, from which $2,982,644 in dividends were paid, leaving a surplus of $598,142. The ore reserves on the property at the close of the year were estimated to amount to 40,360,823 tons, averaging 1.70 per cent. copper. The undivided profits, together with the surplus and quick assets at the close of the fiscal year amounted to $2,633,617. The gross revenue from the copper produced—sold at an average price of 12.75 cents—was $8,008,146, while the gold and silver returned $472,982, making a total gross income of $8,481,129. Operating expenses aggregated $6,135,747, and the total net profit for the year, not including miscellaneous income—$1,263,925—was $2,-

MEXICO.

Guadalajara, Mex., Nov. 5.—Carrizo Copper Company, operating in the Ayutla district of this state, has completed the work of remodelling and enlarging its concentrating plant, and milling has been resumed. The enlarged plant has a capacity of 100 tons daily, but so far the amount handled has not exceeded 75 tons a day. During the time that construction was in progress a supply of several thousand tons of ore was accumulated at the mill, and these reserves will be sufficient for the mill for some time.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax.—It is announced that Mr. J. R. Cowans is soon to leave the province and take up his residence in Montreal. This change is to take place at once. The Springhill Company will in future be carried on as most of the American collieries are, with a manager at the mine who has charge of underground and superintends bringing the coal to the bulkhead, and general officers who control the sales and administration at the head office.

Mr. Sharp, of West Virginia, will have control underground, and has been in Springhill for some weeks.

During Mr. Cowans' stay in Nova Scotia he has come into contact with business, professional and public men and is held in the highest esteem by them, and all will regret that he will no longer be a resident of Nova Scotia. Of necessity Mr. Cowans will be a frequent visitor to this province, and the company will still be administered by him. Mr. Cowans has hosts of personal friends all over Nova Scotia, who appreciate his worth, and they join in wishing him all good things in his new home.

Halifax.—Efforts are being made to create sentiment against reciprocity in coal. This appears to be unnecessary, as the great bulk of Nova Scotians are strongly opposed to reciprocity in principle.

ONTARIO.

Cobalt.—A keg of bullion from the Silver Leaf mine [illegible] week, consigned through the Dominion Express C[illegible]

Messrs. Handy & Harman, Bridgeport, Conn., the weight being 3728 ounces, and the value $1,172.72. The Silver Leaf mine being under lease to the Crown Reserve, who are working the property, the bullion naturally belongs to the latter company, but will be shown separately in the returns.

Sault Ste. Marie.—The recent discovery near Hobon on the main line of the C. P. R., has caused quite a stir among mining men throughout East Algoma, and up to date over fifty claims have been recorded. The site of the new gold field is township forty-nine, range twenty-seven, District of Algoma. It is easily accessible from the C. P. R. and the Algoma Central Railway and is almost due west from Porcupine, which fact causes mining men to think that the new field may be even richer than yet appears.

Cobalt, November 4.—Summonses have been served on the directors of the Standard Cobalt Company, charging them with misfeasance and the improvident disposition of 40,000 shares of the Standard Cobalt Mines, which, it is said, were made over to the Cobalt Central Company, the New York organization controlled by Thomas Nevins & Company.

The action is brought by the liquidator of the Standard Cobalt Mines and is signed by the official referee, J. A. McAndrew. It calls for the presence of the Standard Cobalt directors before the referee in Toronto on November 28. Meanwhile proceedings are being brought in New York whereby various important witnesses concerned in the case are being examined.

Kenora.—Satisfactory progress is being made on the Mikado mine by Manager McKuson. The buildings and equipment have been thoroughly overhauled and the mine is being cleaned up. Rich ore will soon be mined on the 180-foot level.

BRITISH COLUMBIA.

Victoria, November 5.—Mr. R. F. Tolmie, Deputy Minister of Mines, and Mr. F. H. Shepherd, Chief Mine Inspector of the province, have just completed the establishment at Hosmer of the first coal mine live-saving station to be installed by the Provincial Government under the act authorizing the adoption of the system. Others will follow at Middleboro and at Nanaimo. The system consists chiefly of a Draeger oxygen apparatus for the purpose of resuscitating miners and others who may have become temporarily overcome by deadly gases in mines after explosions or other unforeseen accidents.

The station established at Hosmer consists of one of the Draeger oxygen apparatus, which has a two-hour capacity, flanked by two pulmotor, resuscitating devices, with a thirty-minute capacity each. These apparatus have cylinders of 100 cubic feet of oxygen capacity and are of the 1910 model. Four electric safety lamps, one recharging device, and a water gauge for testing device valves go with each apparatus.

These Government stations are to be supplemented by stations placed at each mine, in accordance with Government requirements, by the mining companies.

The system has been installed in many places in Europe, the United States, Japan and even in Siberia, over 4,000 being now established and ready for emergency.

STATISTICS AND RETURNS

DOMINION STEEL OUTPUT.

The Dominion Steel Company had a record output in October, the figures being as follows:—

	Tons.
Pig iron	22,058
Steel ingots	27,034
Blooms	26,113
Rails	15,375
Wire rods	4,743

The Dominion Coal Company also had a big month, the output being 329,000 tons.

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending November 4, and those from January 1, 1910, to date:—

	Nov. 4 Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver		226,217
Buffalo	56,920	2,006,348
City of Cobalt		548,875
Chambers-Ferland		1,527,300
Cobalt Central		293,286
Cobalt Lake		300,900
Cobalt Townsite		601,120
Colonial		245,580
Coniagas	102,460	1,816,436
Crown Reserve		5,314,140
Drummond	400,000	1,064,200
Hargraves	60,000	564,070
Hudson Bay		481,215
Kerr Lake	180,501	9,059,468
King Edward		263,406
La Rose		9,255,841
McKinley-Darragh	210,090	10,604,557
O'Brien	128,034	1,115,250
Peterson Lake (Little Nip)		497,420
Provincial		65,000
Right of Way	74,850	1,545,187
Rochester		60,750
Silver Cliff		268,720
Standard Cobalt		258,951
Temiskaming		1,913,350
Trethewey		853,620
Waldman		63,992
Wyandoh		48,300

Ore shipments for the week ending November 4 were 1,366,795 pounds, or 683 tons.

Total shipments from January 1 to November 4 were 54,462,948 pounds, or 27,231 tons.

BRITISH COLUMBIA ORE SHIPMENTS.

The following are the figures of the ore production and movement for the week ended October 22nd and for the year to date:

Boundary Shipments.		
Granby	13,485	910,019
Mother Lode	7,887	284,050
Snowshoe	2,762	121,954
Jack Pot	791	11,261
Rawhide	3,000	9,700
Other mines		9,523
Total	27,925	1,346,507
Rossland Shipments.		
Centre Star	4,333	155,014
LeRoi No. 2	823	25,813
LeRoi No. 2, milled	300	12,600
Other mines		12,781
Total	5,456	206,208
Slocan-Kootenay Shipments.		
St. Eugene, milled	2,775	116,550
Van Roi, milled	800	33,600
Queen, milled	420	17,640
Granite-Poorman, milled	250	10,500
Nugget, milled	110	4,620

Highland, milled	250	7,850
Wilcox, milled	75	675
Richmond-Eureka	67	3,438
Emerald	35	1,616
Yankee Girl	87	4,339
Sullivan	908	16,820
Hewitt	21	43
Number Seven	137	241
Eureka	45	45
Other mines		35,123
Total	5,980	253,100

The total shipments for the week, including the estimated amount milled, were 39,361 tons, and for the year to date, 1,805,815 tons.

Mine Management

Our organization offers many advantages to investors and mine owners seeking competent management. Under our scheme of management a continuity of policy is assured regardless of changes in the local staff. We are willing that our compensation depend upon results obtained. We know that our methods mean low working costs and maximum profits. Let us make you a proposition.

International High Speed Steel Co. of New York

CARRY IN STOCK AT COBALT, ONT., WAREHOUSE, all kinds of DRILL STEEL in Octagon and Cruciform.

For price and all information write to our Cobalt office, P. O. Box 370.

Our Steel is made in Sweden from best Swedish Ores and is even in grade.

Want Advt.

Mining Engineer, technical graduate wants Position with Coal Co. in Western Canada. Experienced Surveyor, Assayer and Draftsman. Unmarried, age 26. Low initial salary, no objection if chances are good.

Address, Box 653,
Oshawa, Ont.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining ngineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show ns of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a orough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price,

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE FOLLOWING GEOLOGICAL MAPS HAVE BEEN RECENTLY ISSUED:—

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1025. Waverley Sheet. Scale 1 mile to 1 inch.
1037. Windsor Sheet. Scale 1 mile to 1 inch.

QUEBEC

1079. Geological and Topographical Map of St. Bruno Mountain, Chambly Co., Que. Scale 800 ft. to 1 inch.

ONTARIO

1076. Gowganda Mining Division. Scale 1 mile to 1 inch.
1061. Explored routes in a portion of North Western Ontario, traversed by the National Transcontinental railway between Lake Minnitaki and Lake of the Woods. Scale 4 miles to 1 inch.

ALBERTA

1032. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland. Scale 400 feet to 1 inch.
1004. Geological Sheet, Rossland Mining District. Scale 1200 feet to 1 inch.
1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1105. Map No. 4A. Geological—Golden Zone Mining Camp near Hedley, B.C., by C. Camsell. Scale 600 feet to 1 inch.
1106. Map No. 3A, Geological—Mining Claims on Henry Creek near Hedley, B.C., by C. Camsell. Scale 800 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1041. Geological Map Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of the ore bodies of the same belt.
1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.
973. Catalogue of Canadian Birds, by John Macoun and James M. Macoun.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotland Part I, Economics, Part II Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon and Clay Lake, Outario. Accompanied by two maps covering the region, by W. H. Collins.
980. Report on a portion of Algoma and Thunder Bay Districts, by W. J. Wilson, and on the region lying north of Lake Superior between the Pie and the Nipigon Rivers, by W. H. Collins. A map showing the geology along the water courses from Lake Superior to the Albany River and from Missinabi to Nipigon River accompanies the report.
1082. Memoir No. 6. Geology of the Haliburton and Bancroft Areas, Ontario, by Frank D. Adams and Alfred E. Barlow.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.

YUKON and NORTH WEST TERRITORIES

1050. Whitehorse Copper Belt, accompanied by maps, by R. G. McConnell.
1097. A Reconnaissance across the McKenzie Mountains on the Pelly, Ross and Gravel Rivers, Yukon and North West Territories, with map, by Joseph Keele.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mir es. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

THOS. & WM. SMITH, LTD.

NEWCASTLE-ON-TYNE: ENGLAND

Specialists in the manufacture of improved plough steel wire ropes for aerial ropeways, winding & haulage in collieries, mines, etc.

ON TIME

One of the most important business transactions which sensible minded men should perform on time is that of making proper provision for those who are dependent on them for the necessities of life.

The only way to do this is by means of life insurance. The only way to do it on time is to act now while in health. The most satisfactory way is to insure at once in the

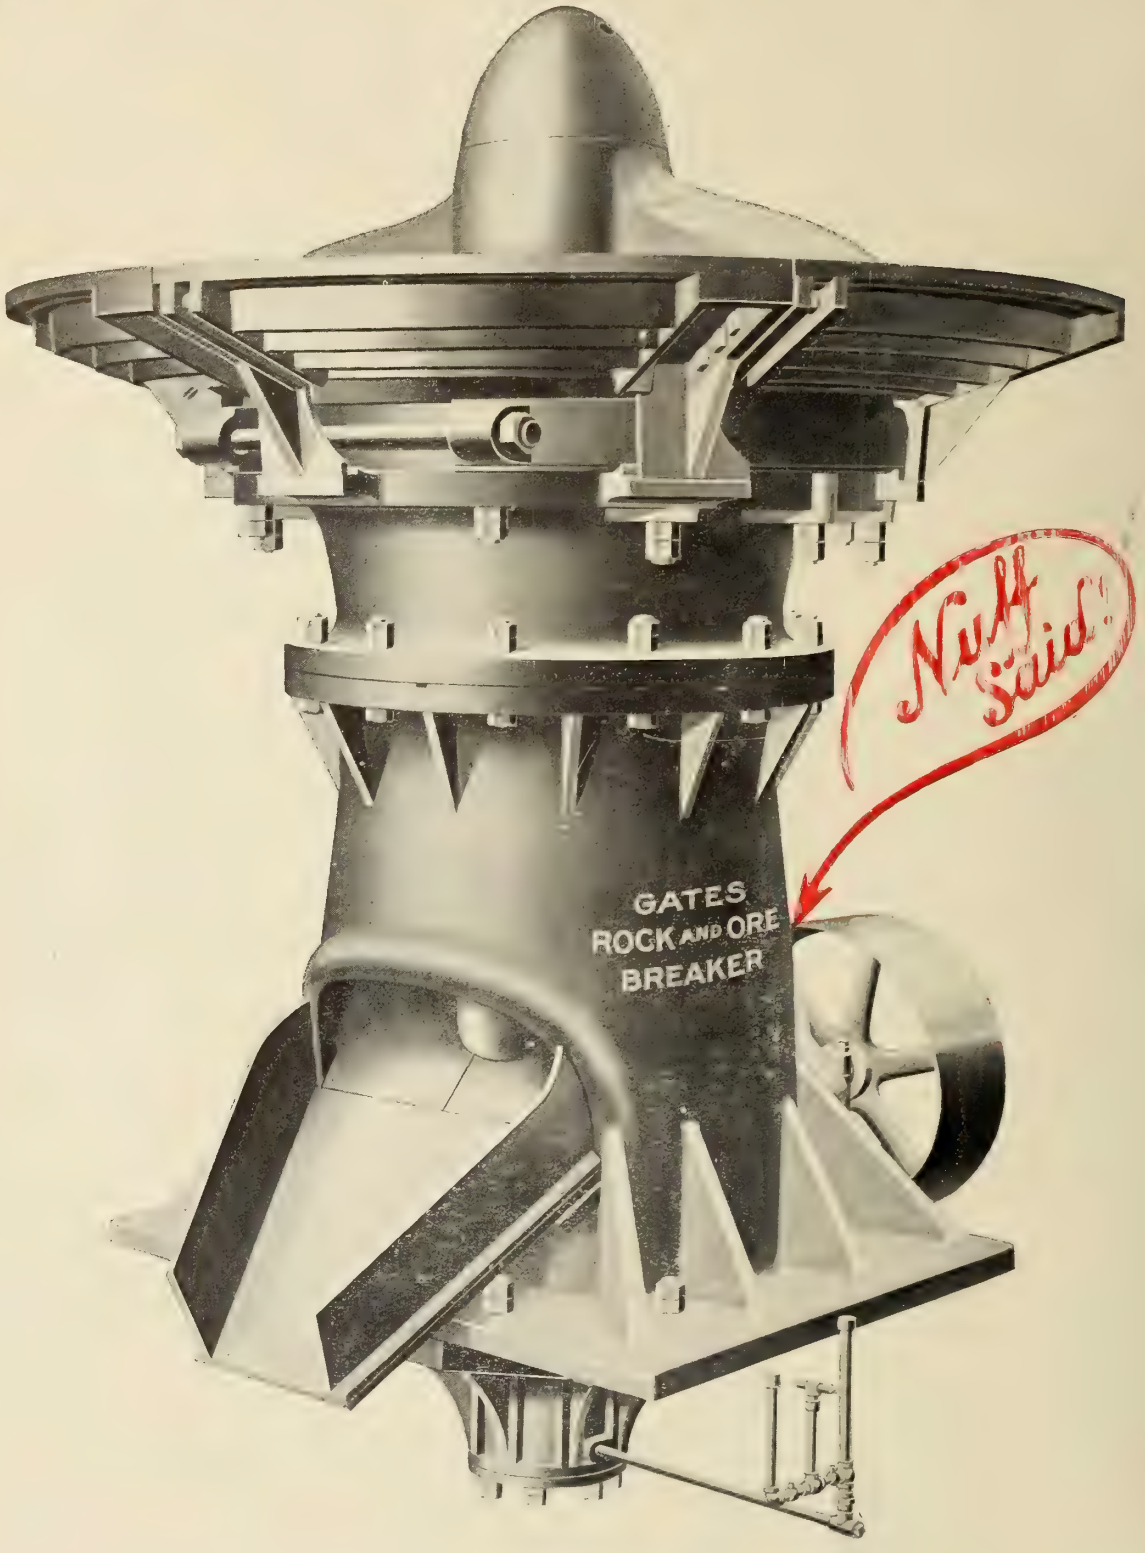
A NEW PRINCIPLE IN CRUSHING

SECTIONAL VIEW OF THE SYMONS DISC CRUSHER



The Symons Disc Crusher is constructed according to an entirely new principle in Crushing. It has two Dish-shaped Manganese Steel Discs the hollow sides of which face each other. These discs rotate in the same direction at the same speed. The stone is fed between them through a central feed opening and is caught between them where they are widest apart, and carried around with them to where they are closest together, being crushed in going half way round. The smaller particles fly out during the next half round and the larger pieces caught again. The crushing movement may be regulated while the Crusher is running.

Let us send you full particulars. Every mining man should get posted on this Crusher which in one operation crushes large rejections or boulders down to a very small size.

"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just becanse it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be the stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we **know**, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs **per year** than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line, As you have everything to gain and nothing to lose, why not investigate NOW?

BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

VANCOUVER ST. JOHN, N.B. HALIFAX, N.S.

ROCK DRILL EFFICIENCY

Rock Drill Efficiency is measured by the length of time the drill stays on the job doing good work, standing up to its original capacity without breakage delays.

MATERIALS—The most carefully selected materials are used in the manufacture of **"Rand Drills."** Vital cast parts are made of high-grade open-hearth steel castings and steel parts are made of the finest steel, each selected to perform its particular function in the operation of the machine. Special treatment of steel parts insure the utmost service from each part.

WORKMANSHIP—Rand Drills are built by mechanics who are experts in their line, with years of experience and every facility and incentive for the best work, in a shop equipped with every modern convenience.

Another Victory for the "DEISTER"

Price $350.00

We are placing 180 Improved No. 3 Deister Slime Tables and 132 No. 2 Deister Sand Tables in the Miami Copper Company's mill, Miami, Arizona. This large order was the direct result of the showing made by the Deister Tables. The No. 2 Deister competing against all of the well-known makes of tables on the market—The Improved No. 3 Deister competing against vanners.

By eliminating teeth in the roller and rocker arm, our driving mechanism is now the most effective, noiseless and durable on the market.

We Build a Pump for Every Service

¶ By this we mean that whether you are draining a mine, are pumping sewage, or cofferdam excavating, or using a pump in one of the many different ways it may be applied, **we have the right pump and the best pump for your work.**

¶ Built in sizes up to 14 in. discharge opening, the Waterous pumps are adaptable for motor, engine, or belt drive. Both Vertical and Horizontal types are manufactured. They contain special features of exceptional merit—split base, split packing gland, reversible barrel, and wear proof runners. They are simple, compact, durable, and run with little power.

¶ No matter what your special needs may be we are confident that we can supply the pump that will fill them most satisfactorily.

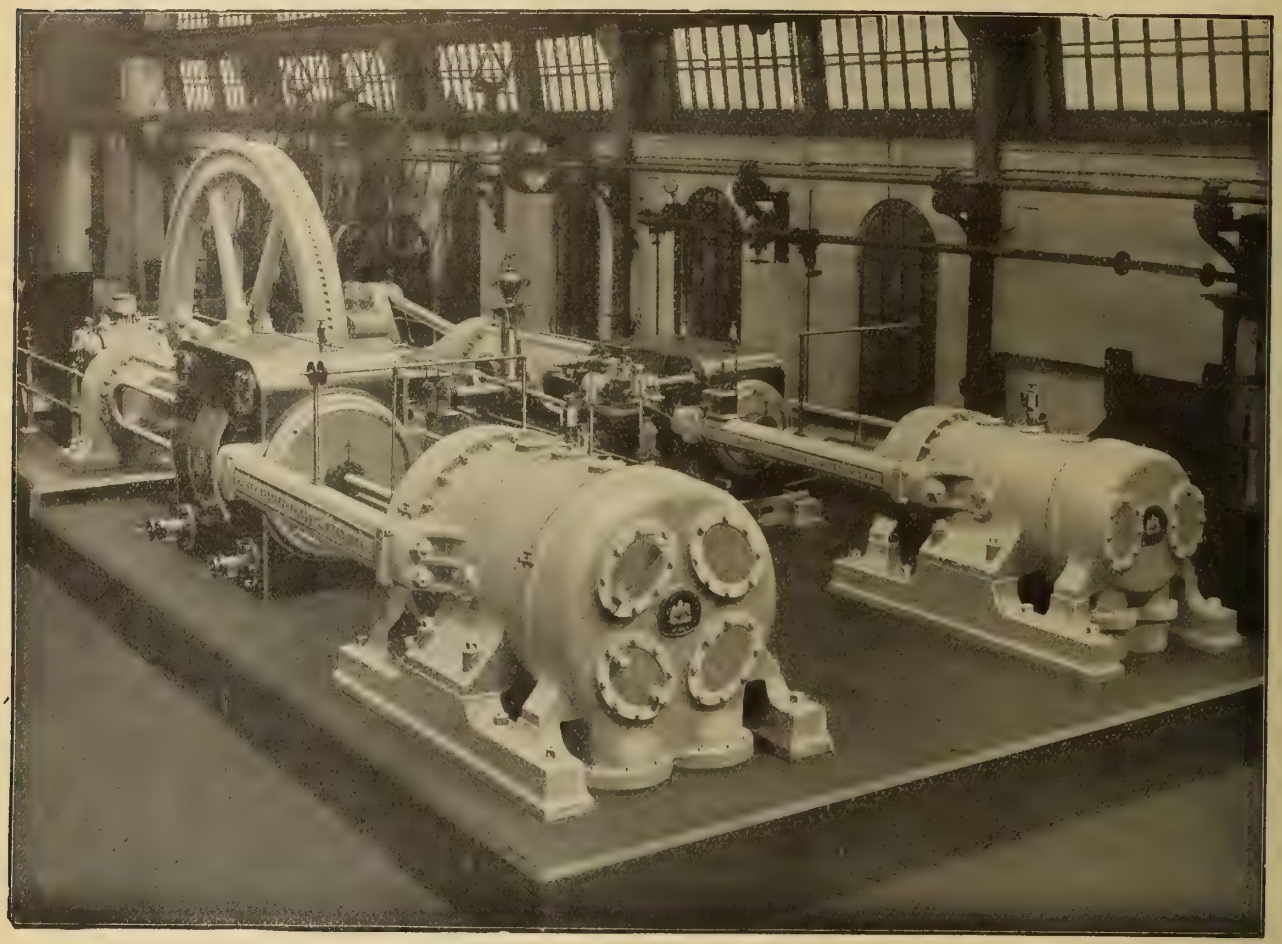
CYANIDE HANDBOOK BY J. E. Clennell

Over 500 pages, 6x9, illustrated, $5.00 (21s) net, postpaid



Mr. Clennell has been in close touch with the rapid developments of cyaniding. He has been instrumental, too, in many important discoveries, and his work in this field has taken him to the leading plants of the world. It deals generally with Cyanide and does not confine itself to the process alone. It is divided into nine main parts covering the subject more fully and exactly than it has heretofore been handled.

Especially noteworthy is the full treatment of recent developments and important phases heretofore *inadequately treated.*

Geology Applied to Mining

By Josiah Edward Spurr, A.M.

Mining men, prospectors, investors and students have found this book a treasure house. It is a plain, simple, straightforward application of economic geology to mining problems. It is a concise summary of the principles of ore deposits for the man who wishes to exploit them. It isn't *geology*, but *geology* as *applied to practical mining*. It boils down the abstract science for the practical mining man and student—the processes of deposits, the arrangement of stratified rocks, igneous rocks, structures, placers, chemical geology, etc., etc.

GOOD BOOKS.

Bridge, auction bridge, poker, and other such devices of Satan, are as wasteful of time and energy in mining camps as elsewhere. Excessive card-playing is a misdirection of time, energy and money. It also softens the moral fibre.

Good books are the most satisfactory substitute for cards. And of good books the supply never fails.

The technical books that are turned out to-day are of high average merit. They are more carefully written, better printed, better illustrated, and are much cheaper than ever before.

A good book is stimulating. No thoughtful man can read Hoover's "Principles of Mining," or Finlay's "Cost of Mining," without profiting thereby. Surroundings and circumstances render most intensely interesting, treatises that in themselves may be arid. For instance, books dealing with metallurgical calculations may prove more exciting than an "Old Sleuth" yarn to the worker who is looking for assistance. The pleasures of recognition are of the keenest. A geological monograph may contain descriptions of rock associations that fit exactly a new district. The mine manager may find in an unpretentious volume a hint that will enable him to save the price of hundreds of books.

But it is not well to look upon books from a commercial point of view. That is best left to the publisher. The blessing of books is that they induce thought, they fertilize the mind, they soothe whilst they inspire.

Reading only books devoted to professional subjects invites mental dry-rot. Every mining man's library should be liberally sprinkled with sound, secular literature of his own choosing. The last two words are most vital. Books lose half their meaning if they are not of one's own selection. The pleasures of discovery should not be neglected.

Books gather more meaning as they mature on our shelves or in our boxes. Throughout life the reader contracts a few high literary friendships. We remember one prospector who carried a battered Keats, wrapped in silk, on all his trips. Never a night passed on which that pocket friend was not produced. Another of our bush acquaintances always puts in his pack a volume of mathematical tables and the latest text-book on certain abstruse problems. His chief delight was to test the clearness of his mental processes by tackling horribly involved mathematical questions. We doubt if the result was as beneficent as a course of Keats.

The better class of novels is not to be despised. Unfortunately few of them can be read more than once. But there are books of many kinds that are never-failing storehouses of pleasure and of profit. As pure liter-

ature alone, the Bible is supremely vivid, varied, and entrancing.

Of the poets there are Keats, Tennyson, Byron, Burns, Edgar Allan Poe, Kipling, Bret Harte, and Stephen Phillips; but few others are adaptable to the bush. Of novelists, most profitable are Smollett, Sterne, Defoe, Dickens, Charles Kingsley (and his brother, Henry Kingsley), Thackeray, George Eliot, H. G. Wells, Bernard Shaw, Maurice Hewlett, and some dozen French and American authors. But most fruitful of all is the realm of the essay. Montaigne, Sir Thomas Browne, Swift, Charles Lamb, Landor, Emerson, Macaulay, Robert Louis Stevenson, Oliver Wendell Holmes, and, in our own time, the whimsical G. K. Chesterton, can all successfully defy sleep.

Another even more entrancing field is that of biography and of autobiography. To our mind the immortal Pepy's Diary stands far above all others. And the Diary can be read at all times and seasons. It can be opened at any page with the assurance that the attention will be held. Notable among biographies are Boswell's "Johnson," Trevelyan's "Life of Macaulay," Lockhart's "Scott," and the life of Tennyson, written by his son. Besides these there are a hundred and one biographies of men who attained fame in other professions than letters. But we must not weary our readers. The world of books is infinite in variety and in scope. We have indicated our own ideas and predilections. Each of us will differ widely or otherwise from his neighbour. But to each, the wonderful temple of literature is open. And the prosaic fact that nearly every good book can be obtained in cheap and portable form, removes all obstacles. All of us will be the better off if we widen our horizon not only in technical literature, but in the general field of letters. A generous knowledge of the humanities does not tend to emasculation; it ennobles, it frees from prejudice and littleness, and it is altogether worth while.

ASBESTOS.

The principle of the "boycott," a device of Celtic origin, is not altogether bad. In its crudest form the boycott is a distressful combination of prejudice and violence. In its modern application the boycott may serve a useful purpose.

For years Canada was supreme in the production of unmanufactured asbestos. Through a combination of circumstances that supremacy is not so marked now. There is, however, one side of the present situation that should be known to every Canadian. Before touching this let us look briefly over the present status of asbestos production and asbestos manufacture.

In 1909, Canada produced 63,349 tons of asbestos, valued at $2,284,587. In the same year the Russian output was 14,654 tons, or about 23 per cent. of the Canadian production. South Africa in the same period produced more than 1,700 tons, and the United States is credited with 3,085 tons. The outputs of other countries are negligible.

As quality is a controlling element in the asbestos trade, it must be noted that the Russian asbestos is all of high grade, whilst that from South Africa, and the United States, is of lower grade. The Canadian output is reported officially at an average price of less than $40 per ton. How correct this figure is it is hard to tell. But it gives some idea of the amount of each grade sold when we learn that the prices quoted for Crude No. 1, Crude No. 2, Mill Stock No. 1, and Mill Stock No. 2, are respectively $270, $152, $53 and $25 per ton. A third grade of mill stock sells at $9.37 per ton.

It is apparent that Russia is our chief competitor and that this competition hits the most profitable end of the business. The outcome of this competition must be left to the future.

Meanwhile, it is timely to note that the manufacture of finished asbestos products is established in Canada. Heretofore, Europe and the United States have practically done all the manufacturing and Canada has been a fairly large consumer of finished products. Now Canadians have the opportunity of using Canadian-made commodities. And they should do so.

The prosperity of the asbestos industry concerns a large portion of the Province of Quebec directly. Whatever errors have been made in the financing of the chief asbestos corporation, have been sufficiently exploited. These errors, we hope, can be retrieved. The industry has a sound physical basis. The increased use of manufactured products will reflect at once upon the mining companies. And there is good reason why Canadians should call for wares made in Canada.

We can hardly expect even the most loyal Canadians to purchase asbestos goods for sentiment's sake. But we can expect them to be interested in the welfare of Canadian industries, and to give preference to Canadian manufactures.

This, we submit, is a rational and fair application of the boycott principle.

* * * * *

Before closing we wish to urge once more the desirability of encouraging in every possible channel the use of fireproof mineral products in the construction of private and public buildings. This is a matter that should be put strongly before our civic, Provincial and Federal authorities.

THE HAWTHORNE SILVER AND IRON MINES.

The career of Mr. Julian Hawthorne has been that of a literary acrobat. Some few years ago he deserted the legitimate field of letters and developed a talent for compiling lurid prospectuses. In these columns and in the columns of several of our contemporaries he has been slated with utmost severity. Yet he continues his amazing gyrations as a promoter. And, of all places in the world, he has chosen London as the scene of his latest endeavours.

Such is the extravagance of Mr. Hawthorne's methods and so complete is his disregard of fact that we must confess ourselves to be convinced that he is either a fool, a knave, or a rare combination of the two. So much for Mr. Hawthorne.

We would have commented upon the Hawthorne Silver and Iron Mines much sooner had we not had cause to believe that certain responsible persons were doing their utmost to ascertain the precise value of the Wilbur iron mine, which, by the way, is the physical backbone of the flotation. Our hand was held merely because we wished to give the project the fairest possible chance. We understood, moreover, that Mr. Hawthorne himself was to be removed from the organization. Instead of this we find Mr. Hawthorne in charge of publicity in Great Britain. We find also that his methods have drawn harsh comment from leading financial critics who, naturally, think the concern that he represents is Canadian.

What we most regret, however, is that the honoured name of Dr. Robert Bell, former acting Director of the Geological Survey of Canada, has been dragged into the matter. That Dr. Bell should consent to associate himself with Mr. Hawthorne is beyond understanding. Dr. Bell is not a mining engineer. The estimation of the extent and commercial value of ore deposits is not and never has been a part of his proper duties. His opinions on these things are of uncertain commercial value. He is an explorer—a very distinguished explorer—and a field geologist. In permitting Mr. Hawthorne to capitalize his reputation, Dr. Bell has lost sight of the duty he owes to the country and to himself. It is painful to be forced to write thus of an honoured Canadian.

. . . . . .

In fairness to those who have supplied the sinews of war to the Hawthorne Silver and Iron Mines, it may be stated that, to the best of our knowledge, they are reputable citizens of the United States. They believe that in the Wilbur iron mine they possess an asset of large value. They are at present pushing work systematically. But nothing can offset the stupidity of allowing Mr. Julian Hawthorne to spread himself in Great Britain.

By the latest prospectus we notice that the names of two prominent Canadians have been added to the directorate. These are Mr. A. Claude McDonell, M.P., and Mr. W. R. Smyth, K.C., both of Toronto. These gentlemen must realize that they are assuming large responsibilities. In the first place, their names are being used to lend colour to statements that are absurd and untrue. In the second place, they cannot escape the moral onus of all the acts of the promoters in Great Britain. Mr. Hawthorne's name smells to heaven. Both Canadian directors must do their best immediately to clear the atmosphere.

We are surprised that responsible journals in the old country, especially our contemporary, "The Mining Journal," of London, which decidedly should know better, accept without question the reading notices that Mr. Hawthorne has been circulating. It will now be their manifest duty to set their readers right.

Editor's Note.—As we are going to press we are informed that Mr. A. Claude Macdonell, M.P., has resigned from the board of directors.

MINING WORK FOR STUDENTS.

Mr. H. E. Haultain's letter in this issue of the Canadian Mining Journal should be read carefully by all who are interested in the training of the young mining engineer.

In a former editorial we suggested that the professors of mining in our various universities get together and pool the possibilities of summer employment for their students, with a view to the suitable allocation of each man.

Mr. Haultain's letter shows how things are managed at the University of Toronto. The certificate that each student must hold as a record of work performed, is well conceived. But in the letter of introduction that is given the student there is a clause to which objection can be raised. Whilst it is quite true that a student should be willing to take any job that he can get, yet we doubt the wisdom of proclaiming this fact from the housetops.

Time was when the student was considered a "pink-tea" artist, an essentially frivolous and privileged being. This idea no longer holds. Our students are men. They are able to hold their own in the bush and in the mine. There is no need of undue humility. The student needs a position in which he can learn something of professional use to him. He is to be a mining engineer and not an artisan. His chief need, apart from strictly technical requirements, is to know something about business routine, managerial administration, company organization, and promotion. In the last direction, promotion, there is opportunity for the clean professional man to establish new standards. But, as a warning, we must remark that promotion is at once the most trying, the most difficult, and the least honoured branch of honest work.

Also, it is imperative that the young mining engineer should realize that his first obligation is to become a real mining engineer. He must round out his experience, mature his judgment of men, mines, and affairs; and must seek diligently to make good in all points. And one of these points is that he become an active member of the Canadian Mining Institute.

M. E.

Our opinion has been asked as to whether a person holding the baccalaureate degrees in arts and science, and, in addition, a diploma of graduation from the leading coal mining college in Great Britain, is or is not justified in writing M.E. after his name. This is a question that is susceptible of several answers.

In the first place, the letters M.E. have specific significance. They imply that the person using them has actually had the degree conferred upon him by an educational corporation. Hence, a person not holding this

degree, no matter what his qualifications may be, is not justified in suffixing them to his name.

The degree of M.E. does not always imply that a man is a mining engineer. The raw college product has much to learn when he leaves college behind him. On the other hand, many men who have no degrees at all are sound mining engineers. The raw college product can honestly use the M.E. The experienced, but degreeless, engineer cannot use it.

We believe that the experienced mining man, provided he has actually operated mines, can fairly append the words "mining engineer" to his name. This implies that he is capable of directing mining operations. But, unless he wishes to follow the example of charlatans and imposters, he will not take liberties with the initials.

BRIQUETTING IRON ORES.

So many already opened Canadian iron ore deposits fall short of market requirements that mechanical concentration will sooner or later become an absolute necessity. The comminution and concentration of these ores implies in most cases the further step of briquetting. Finely-divided ore, fed into a modern furnace tends to cause scaffolding and to induce gas explosions; and where the furnace gases are utilized for driving gas-engines the objection to fines is more marked.

Iron ore briquettes, to withstand the vicissitudes of transportation, must be strong and compact. To suit the requirements of the blast-furnace they must be sufficiently porous and must not crumble when subjected to high temperatures. Moreover, the process should not be costly. These and other considerations are discussed in a paper read before the Iron and Steel Institute by Mr. C. De Schwarz, and reprinted on another page.

The conclusions reached by Mr. De Schwarz are interesting. He believes that a universally acceptable method of briquetting fine iron ore has not yet been invented, and probably never will be. Further, he states that present methods are commercially practicable only in special surroundings and conditions.

It would appear that the whole district of briquetting requires closer study. The applicability of any one process to a given ore does not imply that other ores can be similarly treated.

BRITISH COLUMBIA COAL MINE INSPECTION.

The British Columbia Department of Mines requires its mine inspectors to enforce its laws, particularly in regard to operation of coal mines. Lately, at Ladysmith, Vancouver Island, a special commissioner thoroughly investigated a charge brought against mine foreman David McKinnell for not having taken the steps required of him, in the discharge of his duty as foreman, to secure the removal of discovered gas in No. 3 mine, Extension colliery, owned by the Canadian Collieries, (Dunsmuir), Limited. The charge was brought by James S. Black, who made complaint that McKinnell had unfairly deprived him of his position of fire boss because he had reported the presence of inflammable gas in a working place. The commissioner, after hearing much evidence, decided that McKinnell had been guilty of gross negligence, in consequence of which he found him unfit to discharge his duties as overman, and required him to surrender his second-class certificate of competency, which was thereupon cancelled. The necessity for a strict observance of the coal mining regulations is persistently urged by the mine inspectors. An explosion took place in one of the Extension colliery mines on October 5th, 1909, and resulted in the death of 32 miners. This disaster emphasized the necessity for unremitting watchfulness in the mines there, as gas is found in them from time to time.

PHOTOGRAPHY AGAIN.

Generalizations are unsafe. In our last issue we congratulated McGill University upon establishing a course in photography. At the same time we remarked that we believed McGill to be the first Canadian educational institution to move in this direction.

We now learn that at the School of Practical Science, Toronto University, the chemistry and optics of photography have been a part of the engineering course for many years. Laboratory work and lectures on practical photography have been an integral part of all courses in engineering for at least five years and have been optional for a longer period.

Our apologies are due the School of Practical Science. May its shadow never grow less! May its negatives always be as welcome as that above, and may its proofs be as substantial! Also may it develop and fix itself even more firmly!

EDITORIAL NOTES.

The Nelson, B.C., Board of Trade is addressing itself to the question of the increasing freight rate on coal. It is claimed that the rate on coal should at least be as low as that on wheat. As a matter of fact it should be considerably lower. Wheat is hauled 1,200 miles for about $4.80 per ton. Consumers of coal at Nelson pay a rate for a 330-mile haul equivalent to the rate on wheat for about 500 miles. Moreover, flour, worth much more per ton than wheat, is hauled at the same rate as the latter. When it is remembered that coal supplies the most constant source of freight, and that wheat is only a seasonal freight, the disparity becomes more marked.

The British House of Lords is to be called upon to decide an important dispute between the De Beers diamond company and the Chartered Company of South Africa. The former company is the plaintiff. In 1892 it advanced $1,060,000 to the Chartered Company. This was paid back in 1896. It had been stipulated in 1892 that the De Beers company should be given exclusive diamond rights in Rhodesia. The Chartered Company claims that this agreement lapsed in 1896. The plaintiff

company contends that the Roman-Dutch law covers the case and that the agreement is still valid. The Rhodesian settlers bitterly oppose the De Beers people.

It is earnestly to be hoped that the Great Northern Railway will rebuild the destroyed parts of the Kaslo and Slocan Railway, which formerly connected Kaslo with Sandon, a distance of 31 miles. The mines between Kaslo and the summit of the divide at Bear Lake are urgently in need of rail connections to Kaslo. New development work on the Rambler-Cariboo has made large bodies of ore accessible. At the Washington mine work also is being done. At present ore is being hauled by sleigh to Three Forks, a station on the C.P.R. line from Sandon to Nakusp.

When low grade mining propositions (and "low grade" is a word that changes in meaning with each mineral) are discussed, it is well to remember that working a low-grade ore for a small margin of profit implies the existence of perfect office and technical staffs and the existence of sound and elastic financial reserves. These requisites cannot be created in a day—particularly the staffs.

The present vigorous condition of the zinc smelting industry in the United States is threatened by the depletion of the natural gas supply in Kansas. In that state are about 20 smelteries, embracing a total of 50,000 retorts. For at least 30,000 of these retorts, gas is employed as fuel. Not more than one-half of them can now be kept in commission, owing to the scarcity of gas. A reversion to coal-fired retorts will take at least two years.

The power problem at Porcupine is to be solved. The Porcupine Power Company, an organization backed by the Timmins-Dunlop-McMartin syndicate, along with Mr. A. M. Bilsky, has placed contracts for equipment for generating 3,000 horse-power on the Mattagami. Mr. H. D. Symmes is constructing the plant.

The amount for a four-fifths interest in the Hidden Creek mines, bonded by the Granby Consolidated, is reported to be $400,000. The mines are situated on Goose Bay in the Portland Canal district. The ore is said to average 3½ per cent. copper, and to correspond in silver and gold content to the Granby ores.

The London mining market has been disturbed by leakage of information. It appears that in certain quarters notice of new developments has been received a week or more before it reached the majority of shareholders. This has occurred in both Rand and Rhodesian companies.

A scurrilous correspondent has suggested that Sir Henry Pellatt's new title might appropriately assume the form of Baron Cobalt-Lake. We have not reproduced our correspondent's frivolous misspelling of "Baron," and we adjure our readers to refrain from guessing.

A most creditable special number is the Cobalt Daily Nugget Mining Industry Edition, issued by the Cobalt Daily Nugget. It is profusely and well illustrated, and the text has been carefully edited. It should be in the hands of all persons interested in our great silver district.

The prices obtaining for zinc blende in Joplin are better than they have been for some time. During the former half of November, carloads of 63 per cent. ore brought as high as $50.75 net per ton. Lead ores ran as high as $54.

Nowhere are the good offices of the Geological Survey appreciated more than in British Columbia. Reports on this year's work are looked for with great interest.

BOOK REVIEWS.

ROCK DRILLS—DESIGN, CONSTRUCTION, AND USE, BY EUSTACE M. WESTON, REEF LECTURER ON MINING, TRANSVAAL UNIVERSITY COLLEGE. 367 PAGES. PROFUSELY ILLUSTRATED. PRICE, $4 NET. McGRAW-HILL BOOK COMPANY, 239 WEST 39th STREET, NEW YORK, 1910.

The gaps in professional handbooks are being gradually and well filled. This latest addition to the list of practical books will be welcomed by many.

Until now, there has been no attempt to cover the whole subject of rock drills. We have needed, particularly, a comparison of English, Australian and American drills. Such a comparison is necessary to aid the engineer in his choice of machine for his special needs.

The successive subjects treated are: standard piston drills; hammer drills; electric drills; operating on surface and underground; piston drills using air exclusively; philosophy of drilling rock; repair and maintenance of rock drills; drill steel and drill bits; explosives and their use; theory of blasting with high explosives; examples of drill practice in Africa, Australia, and America; drill tests and contests; dust and its prevention; notes on the use of compressed air. It will be seen that the scope of the book is large and that the sequence is logical.

Among the most interesting incidentals in the book is the Chronological Table, transcribed from Messrs. Holman Brothers' catalogue. From this we are reminded that Friar Albert Magnus described an explosive powder in the year 1280 A.D. In 1412 gunpowder was manufactured in England. In 1613, most significant event, Martin Weigel, mining superintendent, of Frei-

berg, proposed drilling and blasting in mines. The next chronological ite mis also to the credit of Germany. In that year German miners introduced blasting to their backward English brothers. Tamping with clay is recorded in 1685. Two years later, German miners are known to have used straws filled with powder for blasting. Within two years, hardwood tubes and pasteboard cartridges supplanted the primeval straw. But the most important event in the evolution of the drill was the introduction of chisel-bit drills in 1749. This also was a Teutonic innovation.

The first recorded British improvement was the invention, in 1813, by a Cornishman named Trevithick, of a rotating boring machine which was used for quarrying limestone. In 1823, the electric spark came first into use, for firing a blast. In 1831, Beckford, of Camborne, invented the safety fuse. Cave, a Frenchman, invented a reciprocating percussion drill in 1851; and, in the same year, an American named Fowle, patented a direct action percussion drill. Shortly after this, compressed air came into general use. After the application of nitroglycerine to rock blasting in 1863, the development of explosives, detonators and drills was rapid.

As probably the evolution of the hammer drill is the most important of modern developments, it is worth while digressing here to notice Mr. Weston's estimate of the comparative merits of the piston and the hammer types. Mr. Weston points out that, unless one keeps in mind the fact that the rock drill is a commercial machine, one might be tempted to believe the modern hammer drill to be by far the superior machine. The weight of the hammer of the largest type of hammer drill is 15 pounds. The weight of piston, steel, etc., of a piston drill ranges from 60 pounds to 125 pounds. Thus, whilst the velocity of the hammer drill should be 16 times that of the piston drill to get equivalent effect, in practice it is only four times as great. In other words, a very high air pressure must be used to permit the hammer drill to compete at all with the piston drill. Mr. Weston expands the subject capably and well.

Most instructive are two chapters entitled "Examples of Rock Drill Practice," and one entitled "Rock Drill Tests and Contests." The former takes up 90 pages. They cover practice in South Africa and in America respectively. Many cost items are given. The chapter on "Rock Drill Tests and Contests" takes up South African tests largely.

Whilst Mr. Weston's book will call for additions and revisions perhaps more rapidly than books on other subjects, yet it is distinctly a book that will help the mining engineer. In its field it is unique.

MODERN ASSAYING—A CONCISE TREATISE DESCRIBING LATEST METHODS AND APPLIANCES—BY J. REGINALD SMITH EDITED BY F. W. BRAUN—80 ILLUSTRATIONS—145 PAGES—PRICE—J. B. LIPPINCOTT COMPANY, PHILADELPHIA AND LONDON. 1910.

"The art of assaying," so goes the introductory definition, "is a branch of analytical chemistry in connection with mining and metallurgy. Its object is to obtain the value of a stated quantity (usually an avoirdupois ton) by determining the value of a small representative sample." The second last word is the keynote of the whole subject.

"Modern Assaying" is what it should be, a compact, simple, well-illustrated book. The instructions are concise and exhaustive. We are glad to notice that the gas furnace is given prominence. This is usually omitted. The free-hand drawings, illustrating the operations: crushing, sampling, grinding, weighing, etc., are a decided improvement on anything we have seen. Gold, silver, gold bullion, lead, antimony, and copper methods lytic method is the only "wot" method given for coplytic method is the only "wat" method given for copper and lead (together), for the reason that it is both rapid and simple. Useful tables are appended. "Modern Assaying," whilst by no means dealing with the whole field of assaying, is sufficiently inclusive to prove a valuable addition to every mining man's library.

PRACTICAL DATA FOR THE CYANIDE PLANT—BY HERBERT A. MEGRAW — 93 PAGES — ILLUSTRATED—SOFT COVER. PRICE $2 NET. MEGRAW-HILL BOOK COMPANY, 239 WEST 39TH STREET, NEW YORK. 1910.

To help the "Man on Shift" this volume was written. Although it is confessedly a compilation, it is not without original matter. The author, Mr. Herbert A. Megraw, while claiming little originality, hopes that the book will accomplish its object in solving the everyday difficulties of the worker in cyanide. We are sure that, in many cases, it will.

The ground surveyed is as follows: crushing and grinding, the cyanide plant, slimes, precipitation, formulæ in mensuration, tables of general weights and measures, general reference tables. The section "Precipitation" is thus divided: solutions, stoichiometry, preliminary experiments on ores, trouble, data. Under these heads, the sequence of steps is well presented. Necessary chemical equations are included and explained. Under the heading "Trouble," a lot of very helpful and practical hints are given.

CORRESPONDENCE.

EMPLOYMENT FOR STUDENTS.

November 17th, 1910.

The Editor, Canadian Mining Journal, Toronto.

Sir,—In connection with your excellent suggestions in a recent editorial on the matter of work for students and young graduates in Mining Engineering, permit me to put before you the following:

A recent regulation in regard to students in the department of Mining Engineering of the University of Toronto reads as follows: "Candidates for the degree in the Department of Mining Engineering will be required to present satisfactory evidence of having had at least six months' practical experience in work connected with mining, metallurgy or geology for which they must have received regular wages. The time may be spent on geological survey, in ore dressing, smelter or lixiviation works, in an assay office in the vicinity of mining or metallurgical works, on any work in or about a mine other than as an office man or clerk, or in prospecting. Not more than three months on geological surveys will be accepted and prospecting will only be counted as two months) and must not be submitted for more than three of the six months."

The students are supplied with blank forms calling for the following:

Date.....
Name of Candidate.....
Name of Company.....
Name of Manager of Company.....
Location of Operations of Company.....
Exact nature of work engaged in by the Candidate
.....
(Only one kind of work should be mentioned here. Use a separate sheet for each kind of work.)
Name of Boss.....
Date of starting work.....
Date of quitting work.....
Number of days actually employed on this particular kind of work.....
We certify that the above is, to the best of our knowledge and belief, a true and correct statement.

.....
Boss or Time-Keeper.

.....
Candidate.

Countersigned.....
Manager.

To students making inquiries about summer work the following letter is given:

"The bearer of this is a student in Mining Engineering in this Faculty and is desirous of obtaining work during the summer. He understands that he is to get his job from the foreman and is willing to take any job that he can get. He expects no favours nor privileges as a student except this one—that if he shows a willingness in his work he may be moved about from job to job, so as to gain experience.

This letter is to be presented to the manager or the manager's representative. Will the manager kindly advise the bearer to whom to apply for the job and if no job is vacant will he kindly return this letter to the bearer."

When I graduated there was extremely little mining work going on in this country and most of the mining students sought work in the United States or elsewhere, but now the conditions are completely changed and our students apparently have no difficulty in obtaining work in Ontario, and from all the reports that I receive I find that the majority of managers and superintendents are very good to the young men in the way of giving them opportunities for experience.

My personal ideas in regard to this work are expressed in an article entitled "The Undergraduate and the Profession of Mining Engineering" read before the Engineering Society of the School of Practical Science in 1902, part of which I quote.

"In your early years there are several very unorthodox things that I would advise. In all mining work the biggest item is for labour, and there is no other item of expenditure in which money may be lost or saved to the same extent. The human machine is not only the most used, but it is the most complex, and to be a successful mining man you must understand your workman. The best place to study your workman is alongside of him. I strongly advise every young mining graduate to work as a mucker or trammer underground in some fairly large mine. To do this properly you must do it thoroughly and drop all your engineering business, and your diploma and all that, and get into dirty overalls and get your job from the foreman and sleep in the bunk-house and keep away from the office. This I know is often advised, and in Cornwall and Freiberg there are regular practical courses underground where the students play more or less seriously at work, and learn after a fashion to swing a hammer and frame a set. Candidly I don't think much of that—I do not see that such work is of very much use, and in those practical courses you don't learn anything of the men—you don't get round to their point of view. This, to my mind, is the essential point, and my advice is to get a mucker's job and hold it at least over one pay day and over several if you can. It will hurt and it will be hard, but it will be worth it.

"Again, if you have any inclination towards carpenter's work or machine fitting or any opportunity to follow up such work, I say by all means do so. I know of no better qualification for a young man seeking mining experience than a knowledge of machine fitting. There is no part of a mine free from machinery, and the fitter is wanted everywhere and gets a job more easily than any other class of skilled or semi-skilled workman, while a carpenter can often get a job on mill construction or the like that will give him an insight into construction that he could get in no other way. These are not short cuts to success or by-paths—they are stepping stones and most valuable ones at that. I would strongly advise the mining student to spend at least one of his summers in a machine shop or in a carpenter's shop. I would consider this better than a summer spent in an assay office, on survey, or in a mine."

Yours faithfully,
H. E. T. HAULTAIN,
Department of Mining Engineering,
University of Toronto,
Toronto, Ont.

PHOTOGRAPHY AT UNIVERSITY OF TORONTO.

Editor Canadian Mining Journal:
Sir,—

An editorial note in a recent issue of your Journal leads me to believe that you are not aware of the extent to which work in Photography is carried on in the Faculty of Applied Science, University of Toronto. In order to set matters right, I would be obliged if you would give publicity to the following synopsis of our work along this line.

In the first place, the department of photography makes annually a large number of lantern slides, blue prints and silver prints for the regular lectures in all courses as well as for any special lectures and papers delivered before the Engineering Society, either by students, members of the staff, or outsiders.

For the past five years instruction in photography has formed a part of the work in all branches of engineering, being given as a part of the course in light to students of the second year. The curriculum included blue printing and allied processes applied to the reproduction of tracings made by the students from their construction notes, to architectural plans, to designs, etc.; also photography in plates and films of tests and testing machinery as well as outside construction work both during and after completion. From their negatives the students have been required to make contact prints by various processes as well as enlargements and lantern slides. Lectures have also been regularly delivered on the application of photography to surveying and recording, and some good results have been obtained by students along these lines. The various processes of colour photography and some account of photo-lithography have also been taken up in the lectures.

With the development of the four years' course, the work has been separated from that in light and transferred to the third year in order that more time may be devoted to it. The curriculum has been considerably extended, mainly in the direction of increased practical work in the processes already enumerated and by the addition of colour photography and photo surveying.

Yours, etc.,
G. R. Anderson,
University of Toronto.

CONSERVATIVE.

Editor Canadian Mining Journal:

Sir,—In a very interesting, but unsigned article, "Mining—A Business," on page 686 of your last issue, reference is made to the investor's need of engaging competent advisers. As an investor in mines (some of them holding that title only to defferentiate them from other things), I agree with the writer. But I am sorry to inform you that on the two occasions on which I had to rely upon technical advice, my faith was misplaced. These dislocations of my confidence took place in Canada—one near Cobalt, and one at Larder Lake. The two technical gentlemen (holding that title to differentiate them from other things) befooled me in two distinct ways, but two very complete ways. Later I found out that both advisers were not held in very high honour in the profession. But I had no ready way of finding this out at first.

I think, Mr. Editor, that it is a Christian duty for someone to tell the investor by what birth-marks he may be able to tell the competent engineer, or even the honest one.

I may add here, for the benefit of the writer of the article, that both of my friends were described as conservative. Knowing Canada as I do, I cannot believe that this was merely a political label.

Anyway I am now a conservative investor; and I shall not become liberal until I am able to fall in with a good engineer, or follow the one that I employ to the ends of the earth. But I don't wish to encounter another "conservative" adviser.

Yours, etc.,
P. W. Hunt.

New York, Nov. 21st, 1910.

A FEW NOTES ON GOLD PRODUCTION IN NOVA SCOTIA

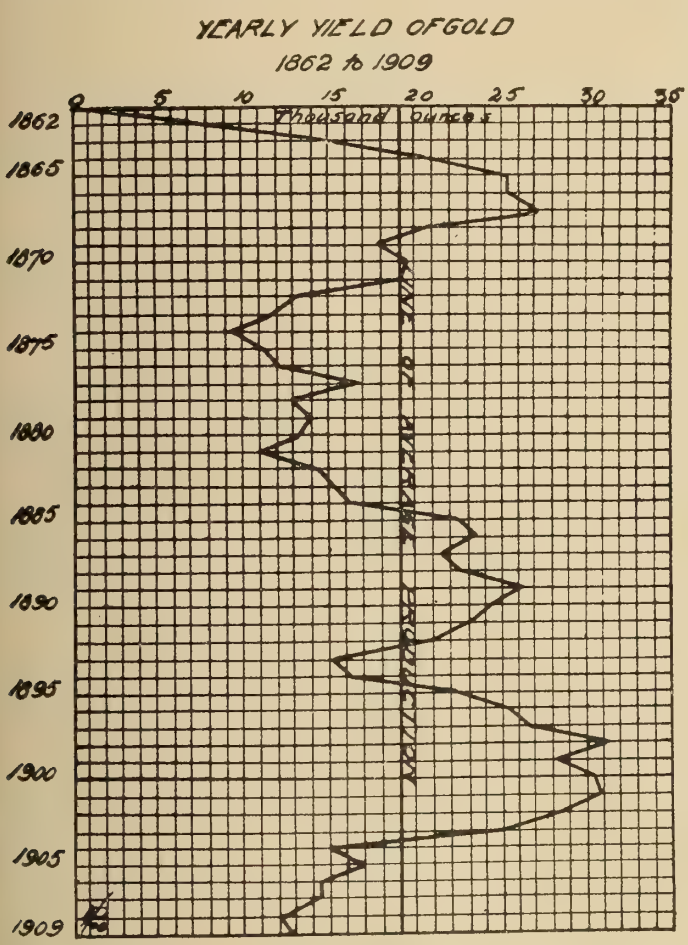
(Written by J. C. Murray.)

The seventeen regularly constituted gold-mining districts of Nova Scotia, along with outlying prospects, produced 908,722 ounces during the period 1862-1909, inclusive. This output resulted from the crushing of 2,031,048 tons of ore. The average yield per ton is, therefore, 0.447 ounce, or $9.24.

That both total and average yields have been higher than this is altogether probable. But this is susceptible of proof only in a general way. It is known, for instance, that gold returns were very carelessly collected and recorded until comparatively recent years. It is also known that much gold stealing has always gone on. How extensive the stealing has been is a matter of opinion and of conjecture. In any case the loss both in specimen ore and in amalgam has been considerable throughout the history of gold-mining in Nova Scotia. Also it has been practically impossible to keep track of the numerous individual tributers who have made livings from working over old dumps and deserted prospects. It is safe, in the writer's opinion, to add at least 10 per cent. to the amount of gold won.

Official returns show that in 1909, the average recovered value per ton was only $4.05 per ton of ore crushed. This average has remained about the same for some years. At first sight it would seem that the general character of the ore was deteriorating. This is not quite the truth. The average yields by districts, for the year 1909, show figures running all the way from 2 ounces 4 dwt., to 3 dwt. But the Stormont district accounts for over 72 per cent. of the ore crushed, and contributed less than 50 per cent. of the gold won. In that district 42,617 tons of ore averaged only $3 per ton. The remaining 16,441 tons of ore averaged about $8 per ton. Moreover, the mill practice in the former district was probably much closer than in the many small mills scattered round the province. As a matter of fact it is as unsound to jump to the conclusion that the general tenor of the ore is lower, as it is to conclude that it is improving. There are not enough facts.

A co-ordinate diagram of the gold-outputs of Nova Scotia is about the best guide. This shows a high peak for the year 1867, when 27,314 ounces were extracted, an average of about $16.75 per ton. Seven years later, 1874, a depression is observed, the yield being but 9,140 ounces, the average also dropping to about $13.50 per ton. A slight peak in 1877 (16,882 ounces), is followed by a depression to 10,756 ounces in 1881. There is then an almost constant ascent, until in 1889, the production reached 26,155 ounces, won from 39,160 tons of ore. A uniform decline then followed until in 1893 the output was only 14,030 ounces from 28,040 tons of ore. Again there follows a continuous rise up to the year 1898, in which 31,104 ounces were won from 86,331 tons of ore. This, by the way, is the largest annual yield on record. After fluctuating between 27,000 and 30,000 ounces for four years, the output gradually fell to its present level.



From all that can be learned the tide has just turned and Nova Scotia is about to ascend the scale again. In fact, the turn came last year. It may be noted that the first period of depression, 1867-1874, covered just the same length of time as does this last period, 1901-1908, exactly seven years. There is no need of placing mystic significance in this number "seven." But it is a recognized fact that depressions and ascensions are recurrent. It is a fact, too, that the mining investor cannot overlook in studying the question of investment.

Referring again to the average yield of the ores, up to the year 1893 the average extraction per ton was well over $10 per ton. In some years it exceeded $25 per ton. From that time on, especially in the years of largest tonnages, the yield per ton fell. It is now rising, along with the tonnage.

There are, of course, many reasons, too many to enumerate, that are advanced to account for the falling off. The best argument is careful and productive work. This is going on gradually.

Looking over the life records of the different districts, I find that Sherbrooke leads with $2,907,039 to its credit. Next comes Stormont with $2,148,008. The former district's ores averaged about $10 per ton, the latter's about $5. Waverley ranks next, $1,329,630, with average per ton of $9; then Oldham, $1,216,012, with average per ton of $23; Caribou and Moose River, $1,088,310, with average per ton of $5.50; Renfrew, $858,313, with average per ton of $16; Uniacke, $834,976, with average per ton of $14; Montagu, $797,767, with average per ton of $29; and so on through the list.

The records outlined above lead one to ask several questions: Is the mining engineer of to-day better fitted to tackle Nova Scotian gold mines than was the old operator? I believe decidedly he is. He has better training, better machinery, better financial backing, better transportation, and all the experience that has

been won before to guide him. Are the gold mines of Nova Scotia exhausted or nearly exhausted, or are the richer deposits worked out? My answer is decidedly in the negative. Why have they not been a success? The answer to this is too complicated to give here, and I would not give it in any case. There has been enough controversy already. Is there yet a good chance for investment? Yes, for investment controlled carefully and well proportioned to the operation in view. Are the possible winnings worth the attention of important investors? The answer to this is part of the formulæ of draw-poker—you must pay to find out.

Let me repeat finally that the signs point to increased production of gold in Nova Scotia. The size of this increase will depend upon the amount of money carefully invested in promising property. The increase will of course mean profit to some one. I believe that the competent mining engineer can guide the careful investor into those profits for a period longer than seven years.

American Mining Congress

The thirteenth annual session of the American Mining Congress was held in the City of Los Angeles, California, September 26th to October 1st, 1910.

Unusual interest centres in the Mining Congress this year, arising principally from its effective and successful fight for the creation of a Bureau of Mines, which was formally established on July 1st. This demonstration of ability to cope with problems affecting the mining industry has brought to the organization increased strength and influence, and the more liberal support of mining men. The Los Angeles session of the Mining Congress will probably be, in many respects, better than any so far held.

The work of the Mining Congress involves much more than the discussions at its annual sessions. An important part of its working machinery is its dozen or more committees, each of which is appointed for the investigation of some particular problem. This work is done during the time intervening between sessions.

During the past twelve months committees of the Mining Congress have been giving their attention to some questions of vital importance to the mining industry. These committees will report to the Los Angeles meeting and their reports will be submitted to the convention for its discussion and ratification.

These committees, with the name of the chairman of each, are:

General Revision of Mineral Land Laws, E. B. Kirby, St. Louis, Mo., Chairman.

Smelter Rates, Harry L. Day, Wallace, Idaho, Chairman.

Federal Legislation, John Hays Hammond, New York, N.Y., Chairman.

Mining Fraud Legislation, Thomas E. Kepner, Reno, Nev., Chairman.

Alaskan Mining Laws, Henry R. Harriman, Seattle, Wash., Chairman.

Coal Tax Insurance and Workmen's Compensation, John H. Jones, Pittsburgh, Penn., Chairman.

Standardization of Electrical Equipment—In Coal Mines, Samuel A. Taylor, Pittsburgh, Pa., Chairman; In Metal Mines, General Irving Hale, Denver, Colo., Chairman.

Trade Relations between United States and Silver Using Countries, J. Frank Watson, Portland, Ore., Chairman.

National Forest Reserves, Col. A. G. Brownlee, Denver, Colo., Chairman.

The mooted conservation question was one of the most interesting subjects to come before the convention, and one which resulted in hot debate. Mining men, particularly in the western states, are becoming aroused over the possibility of the adoption by the national congress of the legislation proposed in the Nelson conservation measures (Senate Bills Nos. 5484 and 5486 to 5492 inclusive), all of which have an important bearing upon western mining conditions.

These bills are meeting with little approval and it is expected that at the Los Angeles session the Mining Congress will determine upon a plan of actively opposing the passage of the legislation during the next session of Congress, or of working for amendments which will be more favourable to mining development.

CONTRIBUTION TO THE PHILOSOPHY OF SHIPMENT SAMPLING

By Joseph T. Mandy, E.M., Ph.D.

Modern sampling consists of two kinds

(1) Mechanical sampling

(2) Hand sampling.

In general practice, where large amounts of material are constantly handled such as at smelters, mechanical sampling, on account of the dispatch of the work, and the resulting economy therefrom is, with few exceptions, carried on. It is a well-known fact nevertheless, that two distinct and diametrically opposed schools exist to-day. The mechanical sampling squad, led by the pioneers of this method, Messrs. Brunton, have, generally speaking, their stronghold in the Western States; the hand samplers in the East. Both schools are continually at loggerheads, and at times the fight has been waged with great energy. This opposition of views has always proved a mischief-maker between eastern ore shippers and western purchasers, the shippers being the aggressors, and some very hard words have been spoken.

Although most smelters, both eastern and western, carry on the bulk of their sampling mechanically, there always comes a stage in the process when hand sampling is resorted to, perhaps for the sake of convenience, perhaps for other reasons; nevertheless the method is generally a combination of mechanical and hand. Perhaps the mechanical people claim that after a certain point has been reached (for a certain bulk) hand sampling can give better and more accurate results than machine sampling. It is, perhaps, questionable whether machine sampling is practicable after a certain point.

Boiling down the whole practice of sampling, it resolves itself simply into a matter of averages. Nobody claims that commercial sampling (by any method) is mathematically accurate; errors are bound to occur in individual samples where the greatest of care is taken. These errors can be either in favour of the purchaser or of the seller, and here the law of chance enters into play; namely, the chance is taken that these errors will average up in the long run; so that at the end of, say, a year's shipments, the likelihood is that the sum of errors in favour of the shipper will equal the sum of errors in favour of the purchaser. However, it is advisable for the interests of both parties that some method be carried out that will cut the chance of errors down to a minimum. Considering these points, it is apparent that, so far as is consistent with economical operation, the greatest pains to bring about accuracy is necessary to obtain the best results.

Too frequently in discussing errors of sampling one hears the remark, that "they will average up in the long run." This is relying too much on chance. The real significance of the science of sampling is absolutely lost, as sampling is devised to reduce the number of chances taken. To sum up the situation, the fundamental law of accuracy in sampling may be laid down thus:

"The amount of accuracy obtainable in sampling varies inversely as the chances taken." Eliminate the chance of an error, and the sampling has that chance more of being accurate.

The ideal form of sampling a shipment is taking the whole amount, smelting it, obtaining its products in commercial form and paying the shipper for same. Here, chance for error in the valuation of the lot is practically entirely eradicated. This is, of course, not practicable. Some method has therefore to be devised which will enable the purchaser and seller to place an accurate valuation on the shipment in question, before the shipment goes to the furnaces to be mixed with other materials.

A small part of each shipment is therefore usually taken out of the total as a sample. This part should therefore be representative of the value of the total. There are ways and ways of taking this small part; from the rough grab sample to the intricate methods of proportional division.

To discuss different methods would need a volume of many pages, and is not within the scope of this article.

In ore shipped in 25-30 ton carload lots, the procedure generally is to obtain about 1-25th (1 ton) of material representative of each lot, and subsequently to reduce this down to a package of 125 grams of material representing the value in the entire 25 or 30 tons. As the bulk of the sample is gradually cut down, greater care is necessary, as the effect of error increases with the decrease of bulk.

Sometimes in shipping material in lots of several carloads of fairly uniform ore, the initial reduction in bulk is brought about by taking every 2nd, 3rd, or 4th, etc., car, as a sample car, and reducing this down in the usual way, and taking the average of the results as being representative of the value of the total number.

As was stated earlier in this article, the ideal method of valuation is the delivery of the total commercial product. It naturally follows that, as this is impracticable, and as valuation has to be carried out by the valuation of a fraction of the total, the greater the number of fractions of the total that can be obtained and valued and averaged, the greater will be the accuracy of the final average. It is thus evident that each additional fraction of the whole taken for a sample is a "chance" on the side of accuracy and vice versa.

Of course it is absolutely impossible in general practice to continue sampling the lot over and over again either by hand or mechanically in order to obtain numerous fractions. It is usually not economical to go over the entire carload more than once. More than this is rarely done. The 1-25th obtained should be reasonably representative. As this smaller bulk is more easily handled, the representative amount taken out of it can be readily duplicated two or more times. This duplication, although assuring greater accuracy of the sample taken out of the 1-25th, does not increase the accuracy of the final sample on the whole lot by the same amount. It is therefore very necessary to exercise extreme care and pains in obtaining an accurate and representative 1-25th.

I.—MECHANICAL SAMPLING.

Modern mechanical mill samplers all operate by taking the whole of the ore stream for a part of the time. The old machines acted vice versa.

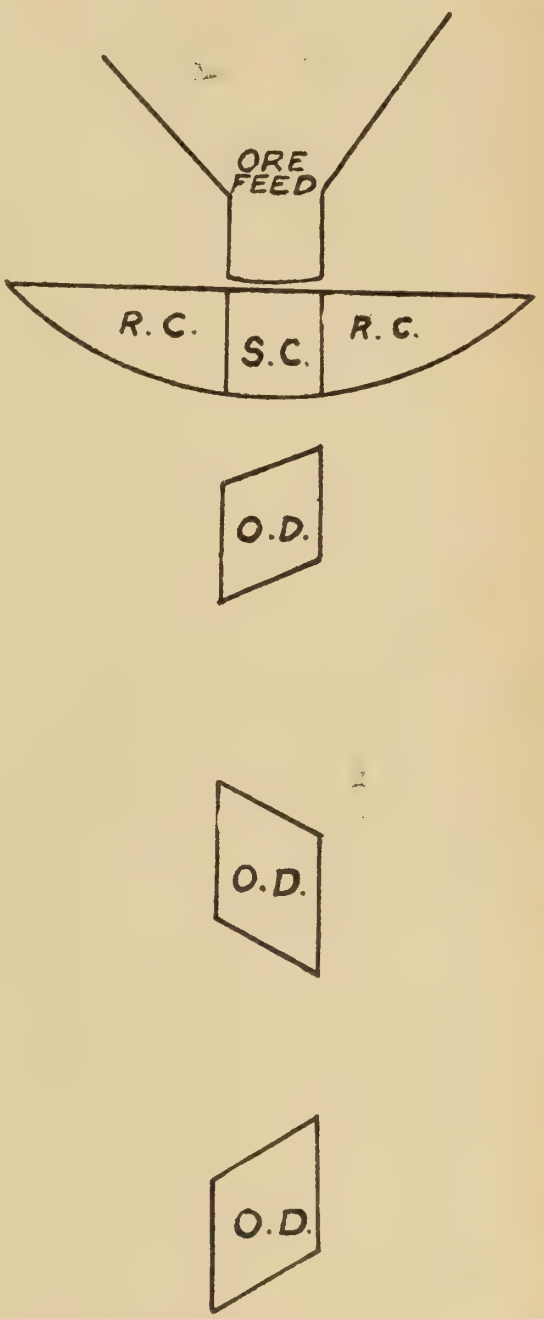
We will first consider the general method employed in a mechanical sampling mill, and pay particular attention to the possibilities of error.

Mill Feed.—Sampling mills can have different feeds. The material can be fed either from (1) a hopper, or (2) directly by hand (shovelling from a feed plate).

(1) Hopper Feed.—This is without doubt the best feed. The total material to be sampled, or as much of it as is deemed necessary, can be dumped into the hopper before the machinery is started up. This insures a constant flow of material to the initial machine (jaw or gyratory crusher, etc.). The flow can then be regulated to suit the capacity of the machine by means of a bar gate. This insures a more or less constant stream of ore to the first cutter (Brunton oscillating, Vezin, etc.).

(2) Hand Feed. Using this method, the material is shovelled from the feed plate into the first machine. The feed plate is fed either by shovelling directly out of the car, or as is sometimes the case with box cars, fed from wheelbarrows. It can be readily seen that such a feed is bound to be exceedingly intermittent, and unless some satisfactory device is installed between the first machine and the first cutter the feed to the latter will be very erratic and intermittent. The feed regulator or flow retarder most generally used, is the shaking table. The beneficial effect of this particular machine is open to criticism. It undoubtedly causes a separation of particles of ore, according to size and specific gravity, and is therefore liable to do more harm than good. A hand feed to a sampling mill is, however on first principles to be avoided. Few modern sampling plants are fed in this way; nevertheless, instances of it do exist.

The advantage of uniformity of sizes of particles.—A big step towards obtaining an accurate sample from the mill is the reduction of the material to as uniform a size as is possible. It is evident that the finer the material is crushed the greater will be the uniformity of size of the particles. It is, however, inconsistent with economical practice to bring about too great a reduction in size. In this the smelting end has to be considered. Furnace losses, or extra expense for briquetting, would result from too fine a material. A happy medium has therefore to be found. Whereas a smelter would object to crushing the total material to say 1-4 inch in size before taking a first cut, they will agree to two or more cutouts each preceded by a reduction in size, the final being about under. say 1-4 inch.



No hard and fast rule can be laid down regarding what size the material should be before the first sample cut of it is taken. This depends entirely on the character and nature of the ore. For most ores, however, a reduction to 1-inch size at least, before an initial sample cut is taken would be necessary. Very frequently 1-2 inch is essential for good work. This latter would be the case for a "spotty" class of ore like Cobalt low grade silicious material. For Cobalt high grade a much greater reduction, with removal of metallics, would be necessary.

In machine sampling the initial sample cut is generally of 1-5, taken by a Brunton oscillating or revolving Vezin sampler.

The feed spout to these machines should be either smaller than, or the same size as the sample compartment, never larger.

The accuracy of mechanical samplers is open to criticism. It is this very point that has caused so much hot feeling between the adherents of mechanical sampling and the supporters of hand sampling. Hand samplers claim that in any cutter the cutting edges have to advance far beyond the sides of the feed spout before the larger particles will enter the sample or reject compartments, during which time the larger particles are going into the wrong compartment and an undue proportion of fines into the proper compartment. The mechanical

SHOWING INTERMITTENT DELIVERY FROM AN AUTOMATIC CUTTER

S.C. Sample Compartment
O.D. Ore Delivery

FIG. 1.

people acknowledge this, but argue that as sampling is a matter of averages any way, the chances are that for the total number of swings or revolutions the sampler makes, the extra amount of fines due to this going into the reject compartments will equal the extra quantity

of fines going into the sample compartment by the right proportion and vice versa, the result being that the errors will average up, and cancel out. This may or may not be true. Again hand samplers claim that the values in a stream of ore are never the same for every section of that stream, which fact is liable to accentuate the above error. The mechanical people reply with the same theory of the chance of averages, which may be true too, but still there is a chance that it may not be so. However, the hand samplers' contention that there is a chance for selection of sizes and values to take place in the mechanical samplers generally used is undoubtedly right. Consequently they wish to remove that chance, and as they cannot devise a machine which is not liable to the same error, their only remedy is not to use any machine.

Intermittent Feed.—After the first sample cut is taken by a mechanical sampler, the most constant feed before the cut was taken is turned into an intermittent one (fig. 1). On account of the irregularity of distribution of values that is liable to occur in a stream of ore, enemies of mechanical sampling put forth the argument that a reject cutout may coincide with a high value section and so the mechanical sampler is liable to cause a selection of values. There is no doubt that this chance does exist, but there is just as much chance that the reverse will occur with the chances that for the total number of swings or revolutions the selection of high and low in reject or sample compartments, will average up and cancel out. With a very intermittent feed such as would result from a shovel fed mill, an extra chance for inaccuracy due both to selection of values and quantity is added.

These chances for inaccuracy due to intermittent feed should certainly be eradicated and no very great difficulty to overcome them is apparent. Remove the intermittent feed and a chance for inaccuracy is removed.

It is claimed that the intermittent stream of ore from the sample compartment of an automatic sampler, becomes constant after passing the set of rolls usually placed between two samplers, in order to bring about the necessary reduction in size before a second cut is taken. This is, however, not entirely the case; the rolls do tend to retard the stream, but the delivery from them to the next sampler is not much improved. The intervals between the different patches of the stream are somewhat bridged over, but the stream, although not quite so irregular, still retains the unevenness induced by the previous sampler, so that it is fed to the subsequent sampler intermittently. It is, therefore, apparent that even with a sampling mill with the best of hopper feeds, a feed regulator is very necessary after the first sampler, and before every subsequent sampler.

Another case of inaccuracy claimed by hand samplers against machine samplers is, that during the swing or revolution of the machine coarse particles of ore coming into contact with the sides of the cutting planes are liable to get knocked into the wrong compartment.

In the ordinary revolving Vezin when this does occur the coarser pieces will always get knocked out of the sample scoop into the reject. With the Brunton flip-flap (stream diverter) it is less liable to occur, whereas with the Brunton oscillating cutter the coarse particles can be thrown either into the reject or sample compartments, the error consequently having a chance to average up. Considering this point, however, it is undoubtedly bad practice to use a Vezin revolving scoop for, at any rate, material coarser than ¼ inch. Some samplers may even consider it bad practice to use this machine for any class or size of ore.

With the Brunton oscillating cutter, the elements of chance and averages again enter into play. However, although the fault outlined above does exist in the Brunton, it is certainly a point for debate whether it is possible for it to make any difference in the final sample, on account of the large quantity of the same as compared with the very small amount of material erroneously deflected. It is certain, in the majority of cases at least, that the error due to this cause will not affect the final result of the sample to the same extent as say furnace or other errors in the final commercial assay of the sample pulp.

The great point, however, in favour of machine sampling over hand sampling is the eradication of the personal element.

There is little doubt that as the above errors in mechanical sampling do exist, debate upon them may affect some improvement, which, even if it eliminates one chance for error is a step further in the direction of accuracy.

Let us consider hand sampling from the same point of view as that from which we have considered mechanical sampling.

II.—HAND SAMPLING.

In considering hand sampling one feature stands foremost as its drawback. This is the personal equation, which is ever present. This is a feature that for accurate and satisfactory sampling it is essential to eliminate absolutely, and it is chiefly responsible for the evolution of mechanical sampling. It is never advisable in sampling ore shipments to allow either a directly or indirectly interested person to handle the material in any way. Manipulation by interested parties is liable to occur even unconsciously, and apart from the actual conscious or unconscious liability for manipulation there is ever present suspicion, which is likely to cause bad feeling between shipper and purchaser. As was stated earlier in this paper, even where the bulk of the sampling is carried out by mechanical devices, there invariably comes a stage where hand sampling is resorted to.

In all commercial valuations, however, when the sampling is carried out by one of the parties interested (generally the smelter which is the purchaser) the other party invariably has his representative on the ground, and it is part of his duties to guard against this manipulation. But this precaution is not sufficient. It is clear then that when hand sampling is carried out entirely on a particular shipment of ore, the chance for manipulation is present during every operation; whereas in mechanical work it is at any rate eradicated for a part of the time. Hand samplers claim that with the class of labour employed to carry out the work, the operations practically resolve themselves into mechanical operations. This may be true during the period of breaking in a gang of men, but is offset by the imperfect way the work is carried out during this time. The men then learn the work, and in a very short time, no matter how ignorant they may be, know what they are doing and why they are doing it. Occasionally a case may occur such as was brought to the writer's notice where a man being broken in by the foreman was put to mixing a small pile of ore previous to quartering, by coning the material up six times. He had completed the third cone and was told to cone the ore up again, whereupon he threw down his shovel and looked at the foreman, saying, "Do it yourself, what do you think I am—a fool?" Thereupon he quit and complained that the foreman was imposing upon him. This incident goes to

show that a workman wants to know what he is doing. The personal equation is the Nemesis of hand sampling.

Non-Uniformity of Sizes of Particles.—The drawbacks attendant upon non-uniformity of size of particles apply in the same way to hand as to mechanical sampling. The influence of gravity, etc., on inaccurate work is perhaps more accentuated in hand sampling as will be shown later. It is an absolute impossibility to bring about even an approximate uniformity of size by any known method.

Frequently in hand sampling a reduction in bulk is brought about by fractional shovelling before any reduction in size of material is introduced; this cannot be too forcibly condemned. Again, an imperfect mixture is ever present in the ore, and the whole bulk of the shipment represented by patches of different values. Where a mixture is attempted it is carried on either by ridging or coning, both of which, instead of mixing the material bring about a concentration of certain particles and consequently of values, due to the segregation of sizes which invariably occurs in these operations; all this despite the much higher cost of the work.

Fractional Shovelling.—This is generally used to bring about a reduction in bulk, either from the ore as located for shipment, or from a pseudo-mixture in a large cone. or from ridges. Every fourth or fifth, etc., shovelful is laid to one side for a sample, the remainder being rejected. The sample is then supposed to represent 25 per cent. or 20 per cent., etc., of the total. It will be acknowledged that this is an extremely raw and unscientific method. In the first place the size of the shovelful is liable to vary very considerably. In fact it is the experience of the writer that the tendency is for the last shovelful of material taken (the sample shovel to be the smallest. In four shovel sampling, for instance, a workman may reject three large shovelfulls and take one smaller for a sample. Even if these all came from a patch of material of uniform value, the percentage represented in the sample is wrong. Although the reverse may even occur, the error is still present. At its best, if large and small sample shovelfuls alternate, the chance for error is ever present. Again, as the portion of the pile from which a sample shovelful is taken is entirely at the discretion of the workman, considerable room for unscrupulous and prejudiced manipulation is present.

Coning and Quartering.—This is the old Cornish method of reducing bulk, and where carried out accurately in absolute fairness and without prejudice can be productive of good results.

Even considering this, however, the chances for errors, both physical and personal, are very great. The operations consist in piling up the ore into a cone, then drawing this out into a cake and dividing it into four equal quarters. Two opposite quarters are then taken and treated in the same way, until the desired reduction in bulk is obtained. A series of this reduction in bulk generally precedes a reduction in size by rolls or other machine which is followed by another reduction in bulk, etc.

The coning is supposed to bring about a thorough mixture of the ore which, as will be shown later, is not the case. To produce a fairly true cone, the following two rules have to be strictly adhered to:

(1) Drop the material on the cone, do not throw it.

(2) Drop the material exactly on the apex.

If these are not strictly observed ,the axis of the cone will invariably be thrown, resulting in a very inaccurate quartering.

For really good work in coning the breadth of each charge dropped should not be any greater than the diameter of the apex. This tends to distribute the material evenly around the periphery. When it is larger it falls on the sides, and is not distributed around the periphery.

Segregation of Sizes of Particles on a Cone.—The most common operation in hand sampling ore is the coning and quartering of the material. It is also usually carried out to reduce the bulk of the sample from the mechanical mill. This method is generally looked upon as fairly safe. The possibilities and chances for errors are, however, great, and as these operations are generally carried out on a reduced bulk of the total shipment, the possible errors are such that their effect can be far reaching, and cause an absolutely inaccurate final result. The common contention that the coning of a pile of ore causes a mixture of the material is a fallacy. In reality the effect of coning is to cause a concentration due to the segregation of particles.

Some samplers think that because the fines collect around the axis of the cone, and that when the cone is drawn into a cake and quartered, if the axis of the cone has been thrown, the cone will fall into one quarter which will consequently contain an undue amount of fines. That this contention is wrong is shown by the following data of experiments carried out by the writer. The experiments also show what the real action taking place in coning is, and its effect on the accuracy of the final result of the sample.

DATA SHOWING

SEGREGATION OF DIFFERENT SIZED ORE PARTICLES IN A CONE

WEIGHTS AND PERCENTAGES OF SIZES IN EXPERIMENTAL SAMPLE

12 MESH OVERSIZE	11,926 GMS	35 594 %

		16 M O	647	16 359	8 962	16 924	- 3 411	
		16 M U	2391	60 455	14 619	60 385	+14 315	
	C	12 M O	2271	22 944	19 042			
		16 M O	1732	17 498	23 992			
		16 M U	5895	59 557	36 044			
CORE	D	12 M O	8475	41 757	71 063			+ 8 173
		16 M O	4645	22 891	64 344			+ 2 556
	BASE	16 M U	7171	35 341	43 846			-10 729

A sample of ore was taken containing known weights of 12 mesh oversize, 16 mesh oversize, and 16 mesh undersize. This material had all passed a ¼-inch screen. The material was very carefully coned up. The cone was then divided into four sections, as shown in Fig. 2, and screen tests run on each section. The results are shown in the accompanying table, and a very evident segregation of size varying in each section is apparent.

It will be noted that the concentration of coarse particles (12 mesh) of ore increases from the apex of the cone to its base. The ratio of this increase also grows in the same direction. The concentration of this size is more accentuated in the bottom section (base section D), which will be the "core" of the resulting "cake."

The concentration of medium size (16 mesh oversize) also increases in the same direction as that of the 12 mesh oversize. The ratio of concentration also grows in the same direction. In this case, however, the concentration is not so accentuated. With the finer particles (16 mesh undersize down to dust) the concentration is the reverse of the coarser ore; the same going from the base to the apex. The ratio of the increase between the base section (D) and the three higher up being very marked. In the sections A, B, and C there is 14.315 per cent. too much of this material, and in section D 10.724 per cent. too little.

From the above it can evidently be deduced that the ratio of concentration of coarse ore from apex to base increases as the size of the ore particles.

In the base 1-4, D, of the cone there is too much coarse and too little fines; in the upper 3-4 there is too much fines and too little coarse.

Now, in drawing out the cone into a cake the base section, D, of the same, practically remains intact, and becomes what has been termed the "core" of the "cake"; the three upper sections, A, B, and C, being distributed fairly evenly around and above it, forming what we will term the "cloak"; the percentage of each size in the "cloak" must therefore be reckoned to the total weight of the same (Fig. 3).

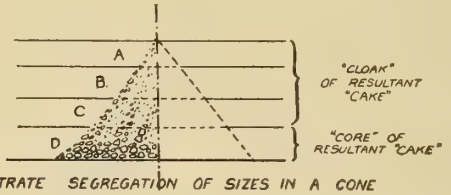

FIG 2. TO ILLUSTRATE SEGREGATION OF SIZES IN A CONE

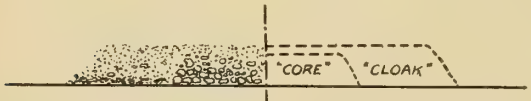

FIG 3. SHOWING PERSISTANCE OF SEGREGATION IN RESULTANT CAKE

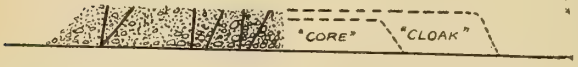

FIG 4. SHOWING DIP SAMPLE SECTIONS AND CONSEQUENT ERROR DUE TO "CORE" AND "CLOAK"

It is thus evident that the "cloak" contains an excess of 14.315 per cent. 16 mesh undersize, a deficiency of 3.411 per cent. 16-mesh oversize, and a deficiency of 10.904 12 mesh oversize.

The danger of the possible effect of error due to this cause on ores in which the highest values are restricted either to the coarse or fine particles cannot be too greatly appreciated.

In quartering the resulting cake, if the quarters are not marked off absolutely accurately, it can be seen that the correct proportionate distribution of coarse and fines will not be represented in the individual quarters.

In building a cone by shovelling, it can be clearly noticed how this segregation does not take place for the first two or three shovelfuls—that is, until the cone has assumed its definite shape, and the angle of slope remains constant. The point at which this takes place is generally higher than the final thickness of the cake, so that the segregated fines around the axis are then distributed fairly evenly on a plane parallel to the base of the cone when same is flattened into a cake.

In drawing out a cone into a cake. a slight segregation of particles also takes place, when the material is drawn to the periphery of the cake and the larger particles roll down the sides to the base.

Sometimes dip samples are taken from the surface of a cake, after marking the same off into squares, when a sample is taken out of each square. That this cannot be too vehemently condemned is evident.

Also frequently in taking moisture samples, the material is coned up and then flattened out into a cake, and the sample taken from the surface of the same. Such a sample will always show an increase over the actual moisture, on account of too great a proportion of fines (coming from the "cloak") being taken (Fig 4).

CONCLUSION.

From the above comparative analysis of hand and mechanical sampling, it is the writer's opinion that in all fairness it should be readily acknowledged that the odds in favour of accurate work are overwhelmingly on the side of the mechanical mill—this, even regardless of the personal equation in hand work. The chances for error are very much less, as also are the effects of the possible errors.

With the conversion of the intermittent feed in a modern mechanical mill to a constant one, by the installation of a suitable machine, the results of the process will be greatly improved. There is also no reason why the bulk reduction of the final mill sample, say 1-25 or 1-125, should not, in every case, be carried out mechanically by using, say, the Jones Riffle, which is entirely superior to the Cornish coning and quartering. In this way the personal element will be reduced to a minimum, and the greatest chances for error will be eradicated. The Jones Riffle can be installed in combination with automatic feeders and the whole process thus remain a continuous one.

With these two improvements, the two main imperfections of the modern mechanical sampling mill using the Brunton machines will be removed, and the results will leave little to be desired.

On August 1st, the Journal published some information relative to the intention of the government of British Columbia to bring into operation legislation requiring the establishment of mine-rescue stations at coal mines in the province, and the decision to equip three government stations as well. Mention was also made of the fact that the government had ordered three complete sets of Draeger apparatus for its own stations. It is pleasing to now learn that about the middle of October the chief inspector of mines for British Columbia, accompanied by the deputy minister of mines, proceeded to Crow's Nest Pass district to establish there the first of the government stations. The two others, to be established on Vancouver Island, will have attention as soon after the work at Hosmer, Crow's Nest Pass, shall be completed, as shall be practicable. It has been stated that the coalfield in the Nicola Valley district will be similarly provided with mine-rescue apparatus and facilities for its use in case of need. It is plainly evident, therefore, that the government of British Columbia is in earnest in its determination to leave nothing undone that is within its power to require shall be done towards protecting the lives of the miners employed in the coal mines of the province.

During the last fiscal year the Dominion Government paid $340,542 in bounties on lead.

THE PREMIER DIAMOND MINE—THE WORLD'S LARGEST CRUCIBLE

Written for the Canadian Mining Journal by
James Cumming.

The Premier Diamond Mine may be styled the Ninth Wonder of the World. It has to be seen to be appreciated. Its actual discovery is disputed by a Mr. Williams, who avers he made the then owner of the Prinsloo Farm aware of his discovering diamonds as far back as 1898, and is at present engaged in a gigantic law suit against the Transvaal Government and the Premier Diamond Company to recover a quarter of a million sterling for so doing. But the historical discoverer is put down as Sir Tom. M. (then Mr.) Cullinan.

View of Village showing Nos. 2, 3 and 4 Gears in the distance

The date of the discovery is mentioned as November, 1902.

The area of the mine is equal to 3,482 claims each of 900 Cape square feet. The English measurement reads 3,344,500 square feet or about 78 acres. Each claim measures 30 by 31 feet.

Possessed of a permit obtained from the secretary at the Johannesburg office, I proceeded by rail, via Pretoria, and alighted, after an interesting journey, at the up-to-date station called Cullinan, named after the discoverer, and situated 25 miles east of Pretoria.

The mine is adjacent to the town, and is surrounded by a double row of barbed wire fencing with several closely guarded entrances and exits. The fences are about ten feet high, separated one from the other by fifty feet, along which armed guards patrol.

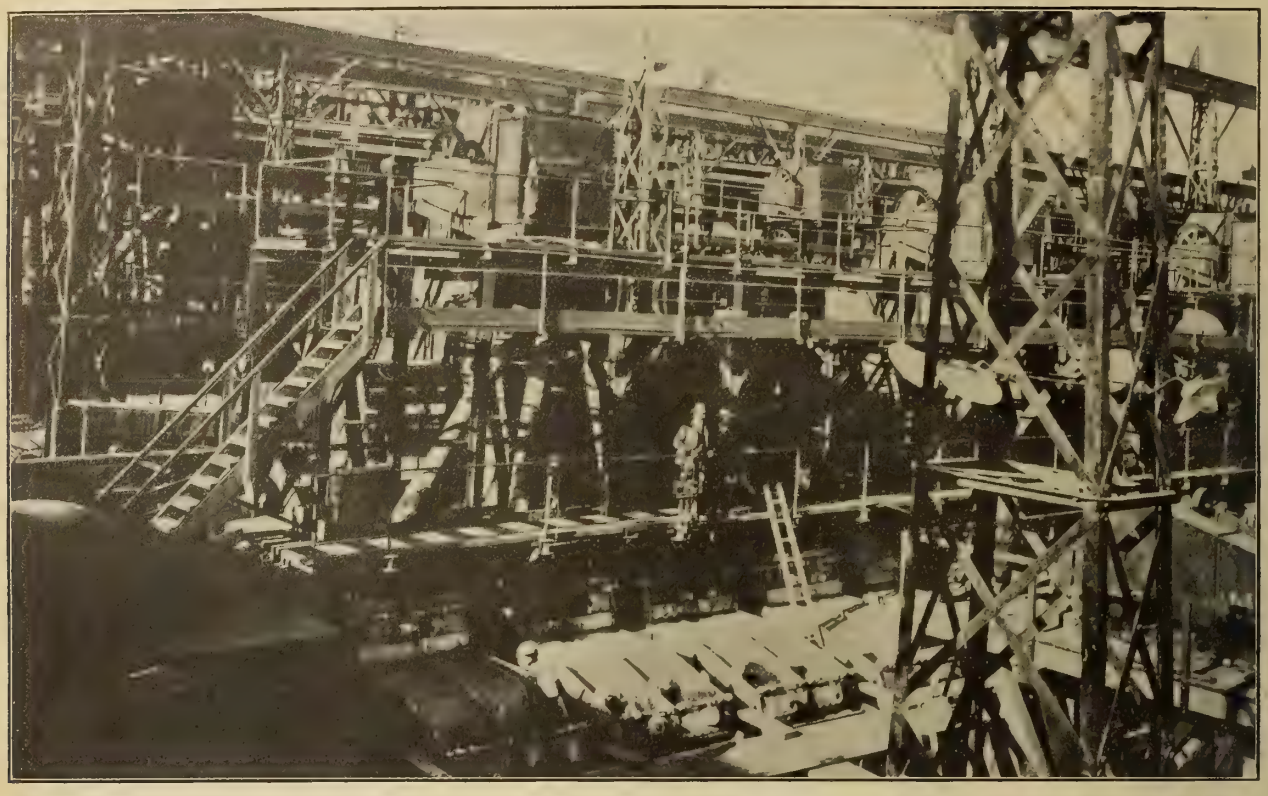
When one enters by the main gate where he presents his permit, and signs his name and address, he is within easy distance of the mine. A very few steps bring you to the edge of the crater, and as you look at the busy hive beneath, one gets dizzy at the moving scene viewed from the giddy height.

The mine is being worked in levels or terraces, each 50 feet in depth. Before one level of this area is stripped another level is half done, and so the work of digging out the big hole will go on until a depth of 1,200 feet will have been reached, at which depth some other method of extraction will have to be devised as it may not be possible to continue the system of open working below that depth with safety to those employed. It will take forty to fifty years to reach the 1,200 foot level at the present rate of output of 22,000 to 24,000 tons of rock per day of 24 hours.

Bore holes have penetrated the magma to a depth of nearly 1,100 feet with satisfactory results, so much so that Mr. F. G. S. Wells, the works manager, who guided me through the mine and plant, and who is, by the way, the finder of the famous Cullinan diamond, declared that the mine would be alive and working when every person living to-day in Africa would be dead.

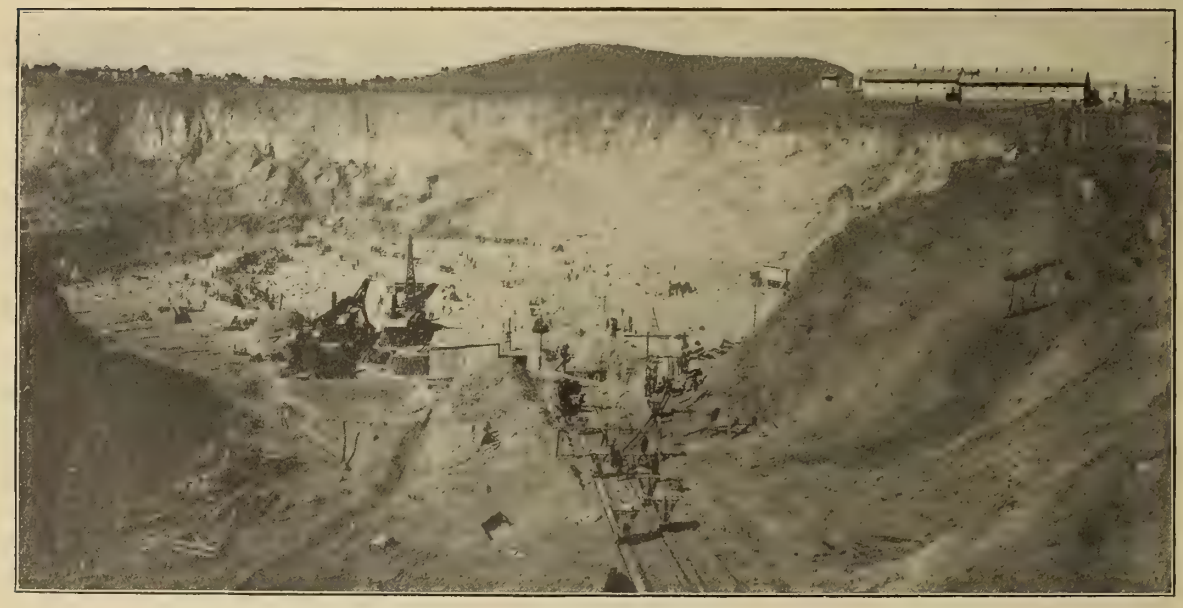
View of Mine from Kopje at back of Native Hospital (looking west). Showing Mine Workings, Nos. 2, 3 and 4 Gears and No 2 Compound and Fences.

The physical features of the pipe area vary greatly in character. The soil is red owing to the presence of iron dissolved out of the neighbouring diorites. Beneath the sub-soil, and for a distance of 50 feet, the colour is yellow because of decomposition, and below the water level the true "blue" ground is reached and so continues downward.



The "blue" ground also varies in colour, showing more carbon where it is blackish, sulphur where yellowish, and predominating in iron where reddish.

In the centre of the area are two great dikes which look like miniature Bass rocks in a firth of diamondiferous magma. These divide the two mines which are nearly round in shape. They are composed of indurated sandstones and quartzites and are gradually being removed.



Three sets of endless haulage gear with a continuous stream of trucks—each of one ton capacity—are in constant operation between the mine and the crushing, washing, and sorting machinery. These gears never cease working unless through accidents.

Workmen are always in the mine, one shift relieving the other, and so the work goes on. Six thousand natives are attacking the faces in the different levels of the two areas at one time, while others attend to the ever-moving long double lines of trucks, one line full, one empty, as they travel to and from the machinery. The loading up is done as the trucks pass along the faces of the open cuttings, which expedites the work.

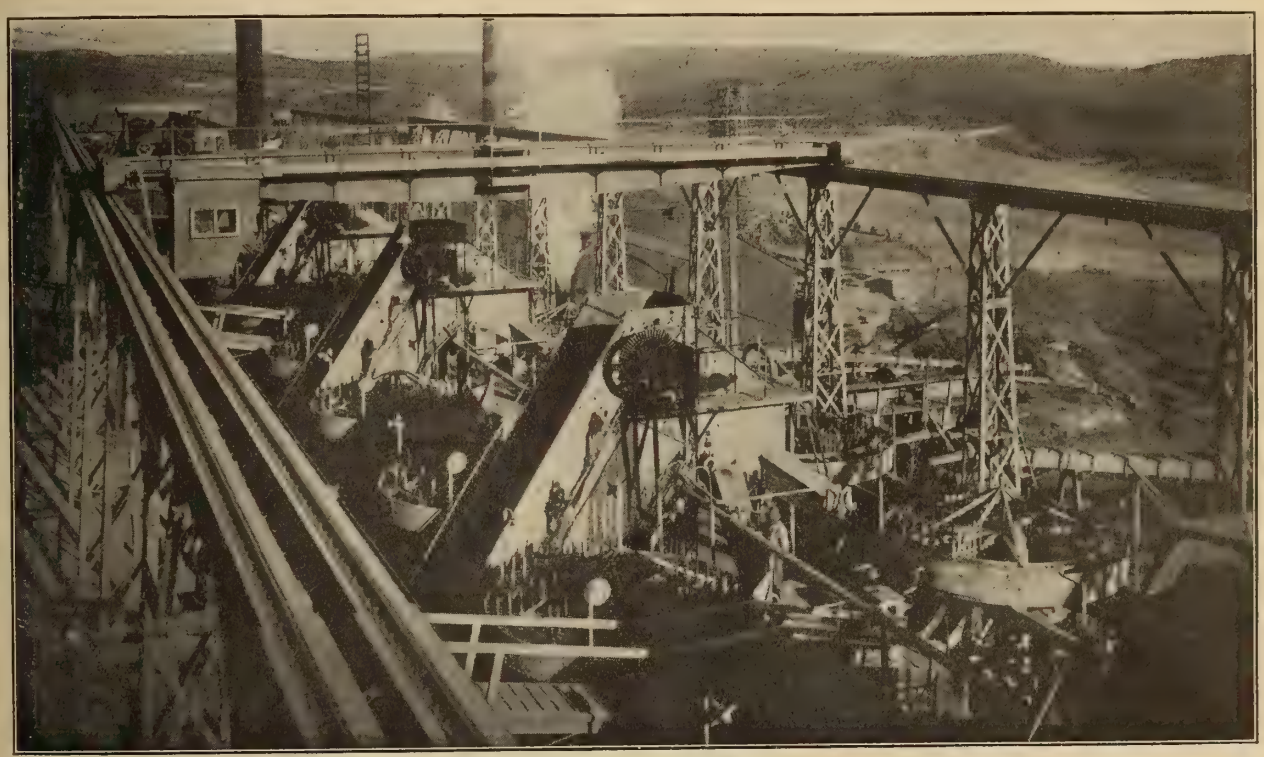
The system of quarrying the rock is unique. The usual process of a jumper and a striking hammer is not in evidence. Two boys handle a long length of 7-8-inch octagonal steel. They lift and let it fall alternately much in the same manner as a steam jumper drilling machine does. By this means two boys bore several

No. 4 Gear Pulsator-Plant, 2nd T eatment. Back view.

View of No. 1 Mine, showing Native Hospital in the distance and endless haulage gear.

three feet holes each shift of 10 1-2 hours. At the end of every shift the blasting is done. One ton of dynamite is used every shift, at a cost of £100.

When blasting is about to be commenced every soul is warned to clear out of the danger zone. To see the boys scurrying to a place of safety is a sight never to be forgotten. Others are less cautious. They become callous and indifferent to danger by daily experience and get underneath piles of old sacks raised high enough for them to crawl under, and there they remain during the disintegration of the diamond bearing rock and in this way escape the showers of falling debris. Strange to say very few accidents occur.



The only thing that suffers is the electric lighting plant which is installed round every working face. To obviate this, and save the expense of constant repairs, four strong search lights are under construction. They are being built on the edge of the rim of the pipe. By this light at night the workmen will see as well as in daylight.

then scraped off, placed in a cauldron, boiled, and run off. Then the diamondiferous matter is again washed and is now ready for the sorting tables.

The Premier mine became famous because of its enormous pipe. It can put all the other mines of Kimberley easily into its area and have space to spare. It added to its reputation when the Cullinan diamond, of world-wide fame, was unearthed. This stone was presented to His Majesty, King Edward VII. The stone originally weighed 3,032 carats, and, after it was cut into three magnificent diamonds, now takes a foremost place among the Crown jewels of the British Empire. Recently another beautiful stone was discovered weighing 191 carats and valued at £16,000.

The mine is owned by the Transvaal Government and the Premier Diamond Company, the first named having six-tenths and the second named four-tenths of the whole concern.

The asset to the Government is a large and profitable one. Its share of profit for the year 1909 reached £438,-

No 3 Washing Plant (portion) taken from No. 3 Bridge. Boiler House and Engine Rooms in background.

Needless to say the sorting and washing machinery is colossal. It would need to be, for up to the 31st October, 1909, 27,508,044 loads of ground had been treated, from which diamonds weighing 8,435,208 carats had been recovered to the value of £7,790,000.

The ore is automatically tipped—the trucks never stopping—into Comet crushers which pulverize to pieces of three inches. These pieces pass on to rotating washers and sets of corrugated rollers and then to pans where the washing process still further reduces the stuff into pulp and separates the diamondiferous rock from the waste. The first named goes on to pulsating gear of a complex character running down and brought up again by an endless system of pipes and small dredging buckets respectively until it passes over a series of jigging tables on which the diamonds are held fast by an eccentric motion as they pass over a fatty substance smeared thickly on the pulsating plates. The grease is

811 out of diamonds realizing altogether £1,454,917.

No less than 13,000 natives, and 800 Europeans are employed on the mine. The town of Cullinan is maintained by them. They run their own stores on the co-operative system, also hotel, chemist shop, and other auxiliary stores incidental to any town.

Sir Tom M. Cullinan is the chairman of the co-operative stores. To his efforts the mine, stores and town owe their existence.

Sir Thomas is also the chairman of the company and enjoys the fullest confidence of the Union Government.

Late reports from Broken Hill South Blocks are to the effect that during October the ore milled assayed 16.1 per cent. lead, 2.48 ounces silver, and 9.51 per cent. zinc. The cost of mine development was 3s. 1.96d. per ton; of ore extraction, 7s. 5.03d. per ton; of ore treatment, 5s. 1.75d. per ton; and general expenses, 1s. 1d. per ton. Total working costs, 16s. 9.74d. per ton.

GOLD AND SILVER MINING AND ORE REDUCTION—THEIR RELATION

(Written for The Canadian Mining Journal.)

Gold and silver are known as the noble metals, and since time immemorial have attracted the miner on account of their beauty and their power to resist oxidation. But it is only in recent times that such advances have been made in the treatment of rebellious and low grade ores of these two metals that they are attracting the attention of mining investors throughout the world.

Gold and silver have many features in common in connection with their treatment. The modern hydrometallurgical processes are closely similar. We shall consider these two metals from the standpoint of the miner, and also from that of the metallurgist, and try to show the relation existing between the two principal departments involved in their production. For this purpose it is well to consider the advances made in gold and silver metallurgy, and their relation to investment.

Mining and metallurgy, like all other fields of human endeavour, are constantly and rapidly undergoing change. Perhaps the industrial evolution that we observe on all sides of us is nowhere so well illustrated as in the metallurgy of these two metals.

We have seen in the brief space of a few years hand-feeders discarded for the machine, and we observe the tendency to make not only modern reduction plants automatic in a mechanical sense, but we are now experiencing what may be termed an automatic chemical advance.

In the United States and Mexico, operators are still to some extent unappreciative of the relation existing between milling, concentrating, and subsequent chemical treatment. We have not yet fully developed and moulded into one these three separate manipulations. Australia and Africa have demonstrated this to be necessary to good practice. Before we reach the efficiency of African, Australian and New Zealand methods, we must recognize that metallurgy depends upon all steps and operations from the time the ore leaves the shaft or tunnel, until the tailings are on the dump, and metal marketed. The requirements for this are a sound and wide knowledge of chemicals, mechanics, and physics.

The mill man, the concentrator man, and the cyanide man, as individual units of a mine staff, will gradually disappear. They will be replaced by the real metallurgist. It is by moulding all individual manipulations into a series of operations so well balanced that they become a simple scheme, that we must look for the true advance in the metallurgy of gold and silver from now on.

Great strides have recently taken place in mechanical separation instead of hydraulic classification, and we have reason to congratulate ourselves on the perfection of ore dressing plants, preliminary to, and after rock breaking, and on the sure and steady progress that is made in all departments of crushing and grinding machinery, and their arrangement. We can look, with a good deal of satisfaction, to modern methods of mechanical sampling and automatic weighing. Great perfection has been attained in all kinds of concentrating machines and appliances, and we are now beginning to know something really valuable about slime concentration. We have now the continuous agitator, and the many forms of filter press. Probably we most miss a cheap, simple, and effective slime dewaterer.

While generally there is a splendid effort being made to make new plants continuous of operation in their mechanical and chemical parts, we are still confronted with the problem of imitation. This, however, is gradually disappearing with intelligent investigation. America is unquestionably developing a practice in part distinctly its own, and there is no question that when fully evolved, it will be both efficient and inexpensive. The backward state of wet metallurgy in recent times, in both the United States and Canada, has, no doubt, been due to high efficiency of the many and convenient smelteries throughout the country. Had it not been for this fact, mine owners would have been compelled long ago to have kept fully up with the best wet metallurgical practice of other mining countries. Mines have been operated, and are still being operated to some extent in divisions, and it is only by full acquaintance with all branches of the business that these will gradually be eliminated, and uniformity, a merging of one department with the other, established. This requires that the metallurgist should be familiar with mining operations, and that the mining engineer should have a metallurgical training, as the mining and treatment of ores are interdependent upon incidental mine equipment. But as the metallurgist is forced to have a knowledge of this equipment, so also is the mining engineer compelled to have a similar knowledge, and thus we find no line of real separation.

A well-established relation between mining and metallurgy is as essential for a proper ore mixture in the dressing process, as it is in smelting operations. Subsequent treatment in its later details is affected by the character of this mixture. There is clearly a close relation between the ore reserves in a mine, and the capacity of the reduction plant. It is essential that the knowledge of the constructing metallurgist should be such that he may be in a position to check and verify these reserves. A far more important relation between mining and metallurgy is that of the life of the plant to the mine. This is clearly of vital importance, and demands that a plant should be erected with a full consideration and sense of the prospective possibilities of the unblocked ore possibilities of the mine. A determining factor is found in the interfering minerals encountered in the different parts of the mine workings. A good miner will watch this matter carefully in order that their influence on the treatment does not embarrass those who are responsible for ore reduction.

Metallurgy may be defined as the art of extracting metals from their ores, and preparing them for the use of the manufacturer. It will therefore be seen that there is no plant or part of the equipment upon the surface, that is not directly or indirectly concerned with the reduction of the ore. It should also be understood that this surface equipment is undoubtedly connected in many respects with the mine equipment. Therefore the cost relationship between mining and metallurgy is the most important relationship of all, because it is upon the proper method of cost keeping and distribution of charges that we are enabled to effect improvements and guide the whole operation of a mining proposition. It will thus be seen that it is impossible at any stage to separate entirely the question of costs in one depart-

ment from its bearing on the cost of some other department.

Again, there is a close relationship between mining and metallurgy on the operating sheets that are used to direct and control the dynamics of the hydro-metallurgical department. While we can benefit by the experience and experiments of other countries, we can only use them as a basis of our own work. Both mining and metallurgy are exact operations, and within the limits of our knowledge few mistakes are made by competent men. But we must realize that a sound knowledge and a thorough training are necessary to the solution of any problem. If an individual undertook to make shoes, it is hardly likely that he would begin the process of manufacture until he had obtained men competent to make shoes. Why, therefore, should those incompetent to mine and treat ores undertake the extraction and reduction of these metals? This matter is clearly one for experts. Imitation has never wholly solved any problem, and never will. We must eliminate imitation from our practice and our business methods, and only take what, in the judgment of men trained thoroughly the business of mining, is thought to be suitable for the problem in hand. It must be realized that every mine, no matter where situated, has its local conditions, and its local requirements, and therefore it is only by skill that these requirements can successfully be met. Every metallurgical problem is distinct and depends on the individual ore, and its particular chemical and physical constituents. While the general design and mode of operation of any one reduction works may be to all appearances similar to the mill adjoining, the operating metallurgist will have to use his brains to solve the little local requirements inside the mill in his daily manipulation.

We have arrived at a stage in the history of gold and silver mining where no failures should be recorded on a given payable ore body through operation. We have machinery together with our knowledge and control of the forces of mechanics and physics to assist the miner. We have arrived at a state of mine equipment that would astound the forty-niner, and we are triumphantly marching to a metallurgical goal that even five years ago was not contemplated. We are at present evolving the continuous treatment process, and few at the present time realize what this means for the future. An ideal process would be that which could treat ore without men, and without supplies. We have not eliminated all the men yet, but they have been reduced over 50 per cent. in this last seven years, and supplies have been correspondingly diminished. There is no doubt that the metallurgical chemist will succeed in wonderfully reducing the present consumption of material.

In a brief review of this kind it is impossible to allude specifically to the splendid work that has been done in the various modifications of the cyanide process, and to enumerate and describe the different machines and appliances that have been brought together to effect this evolution. But the time is not far distant when we shall begin to realize that this evolution of the mining and metallurgical industry of our time as applied to gold and silver will in itself become revolutionary.

It is estimated that 40,000,000 tons of iron were carried through the Soo Canal during the past season.

The Newfoundland Oilfields, Limited, has contracted for the sale of its total output. Two new complete drilling outfits have recently been delivered on the ground.

Fire Protection at the Plants of the Amalgamated Asbestos Corporation

One would naturally expect the plants of the largest asbestos concern in the world to be well guarded against fire risks. This is certainly true of the Amalgamated plants at Black Lake and Thetford Mines. From Fire Inspectors' reports the following notes are compiled. It will be seen that the buildings at all the mines are in excellent condition. Every reasonable precaution has been taken to provide against their destruction by fire.

Dominion Mines, Black Lake.—This plant consists of one main mill building with adjacent warehouse and dryers, the latter buildings separated from the mill by about 100 feet of space. The dryers are well installed in a separate building, are of modern design, and have good overhead clearance, with flues thimbled through roof. The electric heaters are installed in the main building with safe surroundings. There are individual motors on all machines, supplied with current derived from high-tension circuit and step-down to 2,200 volts. Wiring and appurtenances are all of standard design and carefully arranged and installed. Premises are clean. The dust collectors all vent into monitor on roof.

For active fire-fighting, there is one double hydrant on the town main. It is of 6-inch size and is situated near office. Nine hundred feet of good cotton jacketted hose is kept on hand. Numerous 3-gallon chemical extinguishers, water casks, and pails are distributed throughout all buildings. The plant depends on the fire brigade of the Standard Mines for fighting fires.

The one-storey dryer building is provided with a metal roof. The walls are asbestos sheathed. The floor is of cement.

Standard Mines, Black Lake.—The plant consists of one main building, which includes the mill, machine shop, dryers, and crushers; and one detached building containing the boilers. No serious defects exist in the installation of electrical plant. The crushers, dryers, heaters, and lights are well arranged as regards hazards. Premises are clean and well cared for

For fire protection there is one hydrant near the Dominion Mill. A fire department of ten men is always ready for duty. There are numerous 3-gallon chemical extinguishers, water barrels, and pails.

The protection here has lately been improved by the installation of two new hydrants that command both mills. The few changes recommended by the Inspector have been carried out.

British Canadian Plant, Black Lake.—The large mill here consists of nine connected main buildings, one of which is four storeys high. All have metal roofs and are of open finished frame joisted construction. Fire protection is described as being ample.

Electric power is used. The equipment is of the highest grade and is well installed. The main power rooms are enclosed in asbestos-sheathed partitions and are practically dust-proof. The switches and starting boxes have excellent surroundings. Risks are carefully guarded. One stove in Shed No. 21 was complained of, as also was a pile of cordwood near the dryers. Both these items were attended to promptly.

The fire protection consists of a new pump driven by electricity. It has a capacity of 500 gallons per minute, supplying a 3½-inch line. The line is supported on the dump trestle. There are take-offs at the machine

shop and dryer buildings. The latter connection is provided with 200 feet of 2½-inch hose. There also are two yard hydrants on the town main, one near the office and one adjoining the machine shop, each provided with 500 feet of good 2½-inch cotton-jacketted hose. All buildings are equipped with numerous water casks, pails, and Badger Chemical Extinguishers of 3-gallon size. The latter are all new and recently charged.

The plant is patrolled hourly by a watchman who punches a ten-station portable watch clock. There are no external exposures except railroad running west of the plant.

King's Plant, Thetford Mines.—There are here two separate mills. They are both open finished frame of very heavy construction where necessary. The sub-station is of brick. Buildings vary from one to five storeys in height, have composition roofs, and are fairly clean and in good condition, though No. 1 Mill is crowded.

Hazards are few. The electrical installation is excellent. The only boilers in use are for the hoisting engines. Heating is effected by means of steam coils. Premises on the whole are well cared for.

For fire protection a large electrical pump having a capacity of 3,000,000 gallons per 24 hours, is situated in a pump house near the river. This supplies all yard hydrants and vertical pipes in the mills. There are two vertical pipes in No. 1 Mill and one in No. 2 Mill. To each is attached 50 feet of 2½-inch cotton-jacketted hose at every floor. There are also two completely fitted hose wagons, each provided with 500 feet of 2 1-2 inch jacketted hose with full equipment of lanterns, spanners, nozzles, etc. There is also one truck with five ladders.

All the apparatus is manned by volunteers who are paid for time consumed in drilling. The department is under a chief and one assistant. It numbers 35 men. Weekly drills are held.

The full quota of water casks, pails, and chemical extinguishers is kept on hand.

Two watchmen make hourly rounds, controlled by two Eco 6-station clocks.

The town depends upon the equipments of the mills for its own protection from fire.

Beaver Plant, Thetford Mines.—This fair-sized mill occupies one large main building and several small adjacent and outlying buildings. Except the dryer house, the buildings are all one to four storeys high. They are of heavy mill construction with factory floors. All have open-finished frame walls and composition and shingle roofs.

The plant is roomy, clean, and in good condition. The new dryer building is fireproof. Hazards are few. Steam heat is used when necessary. Electrical equipment is thoroughly well installed. Sweepings, shavings, refuse, etc., are well taken care of throughout the plant.

A Snow fire pump, size 10 by 16 by 12, draws from a 15,000-gallon cistern, which is fed by two electrical pit pumps and by city mains. The pump is housed in a separate building. There are two stand pipes in the mill and one in the boiler house. Each has connection on every floor, provided with 50 feet of 2½-inch hose. There are three yard hydrants supplied with town water. These hydrants are 3-way, having 2½-inch and 4-inch outlets. The plant is supplied with hose reel carrying 300 feet of hose. Many chemical extinguishers, water pails, and sand pails are distributed throughout the buildings. The town fire department responds to fire signal.

One watchman makes hourly rounds, controlled by a 12-Station Eco portable clock.

The Inspector found no defects in this plant from a fire protection point of view.

The annual saving in insurance rates effected by this careful control of risks must be considerable. Apart, however, from this positive saving, the care exercised points to the fact that the spirit of efficiency marks the plants of the Amalgamated.

Mine Rescue Work in Britain

(Written for the Canadian Mining Journal.)

Rescue work in mines in England and Scotland is now long past the experimental stage, and properly equipped rescue stations have become a part of the normal equipment of the British coal-fields. There are now nine such stations either in operation or nearing completion. In Yorkshire, which was the pioneer county in rescue work, there are three stations; namely, Altofts Colliery near Normanton, Tankersley and Wath. The Altofts station was the first erected in Europe; the Tankersley station was the first erected in Great Britain. In Lancashire the Howe Bridge station has been in operation since October, 1908. In the Midlands a rescue station has been erected near Mansfield, but is not yet in full working order. In Wales there are two stations, namely that at Aberaman, which serves the Cardiff district, and one at Crumlin in Monmouthshire. A large and modern station is almost completed at Elswick, Newcastle-on-Tyne. This station is supported by the coal owners of Northumberland and Durham in conjunction with the firm of Armstrong, Whitworth & Company. There is only one station in Scotland, namely, that at Cowdenbeath, which serves the counties of Fife and Clackmannan. Although, as will be seen from the foregoing, great progress has been made in the provision of rescue stations, there yet remain a number of counties unprovided for. There are no stations in the coal fields of Staffordshire and Warwickshire, in the Swansea coal field in South Wales, nor in the West of Scotland or North Wales. Meetings of the coal owners have been held in most of these unprovided districts and committees appointed to take up the question of rescue stations, but so far no definite progress has been made.

All the British stations are provided with smoke galleries for the training of men in the use of the apparatus. A typical gallery is that at the new station at Wath in Yorkshire. This gallery forms three sides of a square surrounding the paved yard of the station; the walls are of brick provided with doors having spring catches easily opened from the inside, and with observation windows through which the men under training can be watched. The floor of the gallery is filled up with shale and stone from the mine and supplied with all the necessary material for building stoppings and the ordinary mine timbering, together with pit tubs and rails. Contracted and tortuous passageways are provided to imitate the conditions of travelling which might be expected to exist in a mine after an explosion. The gallery can be filled with a dense smoke, which can be made as malodorous as the superintendent of the station wishes. The temperature of the air and its humidity can both be varied, an important feature, as it has been found in actual rescue work that the humidity of the mine air tells very quickly upon the endurance of men wearing breathing apparatus. It will be remembered that one of the rescue corps at the Hamstead fire

succumbed to heat apoplexy. The men under training work in this smoke, wearing the apparatus and doing, as far as possible, the same arduous work that would be expected of them if they were actually occupied at rescue work in the mine.

The instructor at the British stations is generally a retired non-commissioned officer from the army, not necessarily acquainted with coal mines. His work is to keep the register of attendance and proficiency, and see that everything is in readiness and in good order as far as the pit mouth,—beyond that his duties do not extend, as the trained corps naturally place themselves under the direction of the mine manager wherever and whenever their services are required. These ex-non-commissioned officers have proved themselves very suitable and efficient, as it is necessary for the proper working of these stations that a certain amount of military discipline be observed.

The stations are usually situated near a railway station—that at Wath, for instance, being within five minutes' walk of three stations all serving colliery districts. At the Elswick station, a motor is to be provided for the brigade and the apparatus, but at most stations it is not necessary to keep a motor specially for the use of the station as this mode of conveyance is now so common that no difficulty is experienced in getting a car quickly.

Following upon the Mines Accident (Rescue and Aid) Act, 1910, the Home Secretary has appointed a committee to consider the organization of rescue and aid in cases of accidents in mines. The personnel of this committee has been well received by the mining profession in Britain, and it may be expected that satisfactory regulations will shortly be framed by them.

The combination of rescue work with instruction in first aid and ambulance classes is gradually becoming more and more pronounced. In reference to this the "Colliery Guardian" remarks: "There has been too great a disposition to give prominence to the breathing appliances at the expense of other factors which enter into this question. What is necessary is so to organize the staff at every colliery that they may be able to render the most effective aid in the event of an accident occurring, whether it be an explosion or a fall of roof. It is probable that the appliances will be of service only on special occasions—the fewer the better—but hardly a week passes in which there is no work for what may be called the 'Medical Service Corps' of the Colliery." This is a point of view which cannot be too strongly urged. The usefulness of even the slightest knowledge of first-aid work in the case of accident underground can only be estimated by those whose daily work brings them in contact with such things. A great deal of unnecessary suffering, and many lives also, could be saved if more interest were taken by underground workers in ambulance instruction. It seems more than probable that the rescue station as it is known to-day will eventually evolve into an institution that will be a combination of a fire station, having provision both for underground and overground fires, an emergency hospital, and a place for the training of men, who, to use the happy phrase of the "Colliery Guardian", may be called the "Medical Service Corps" of the colliery.

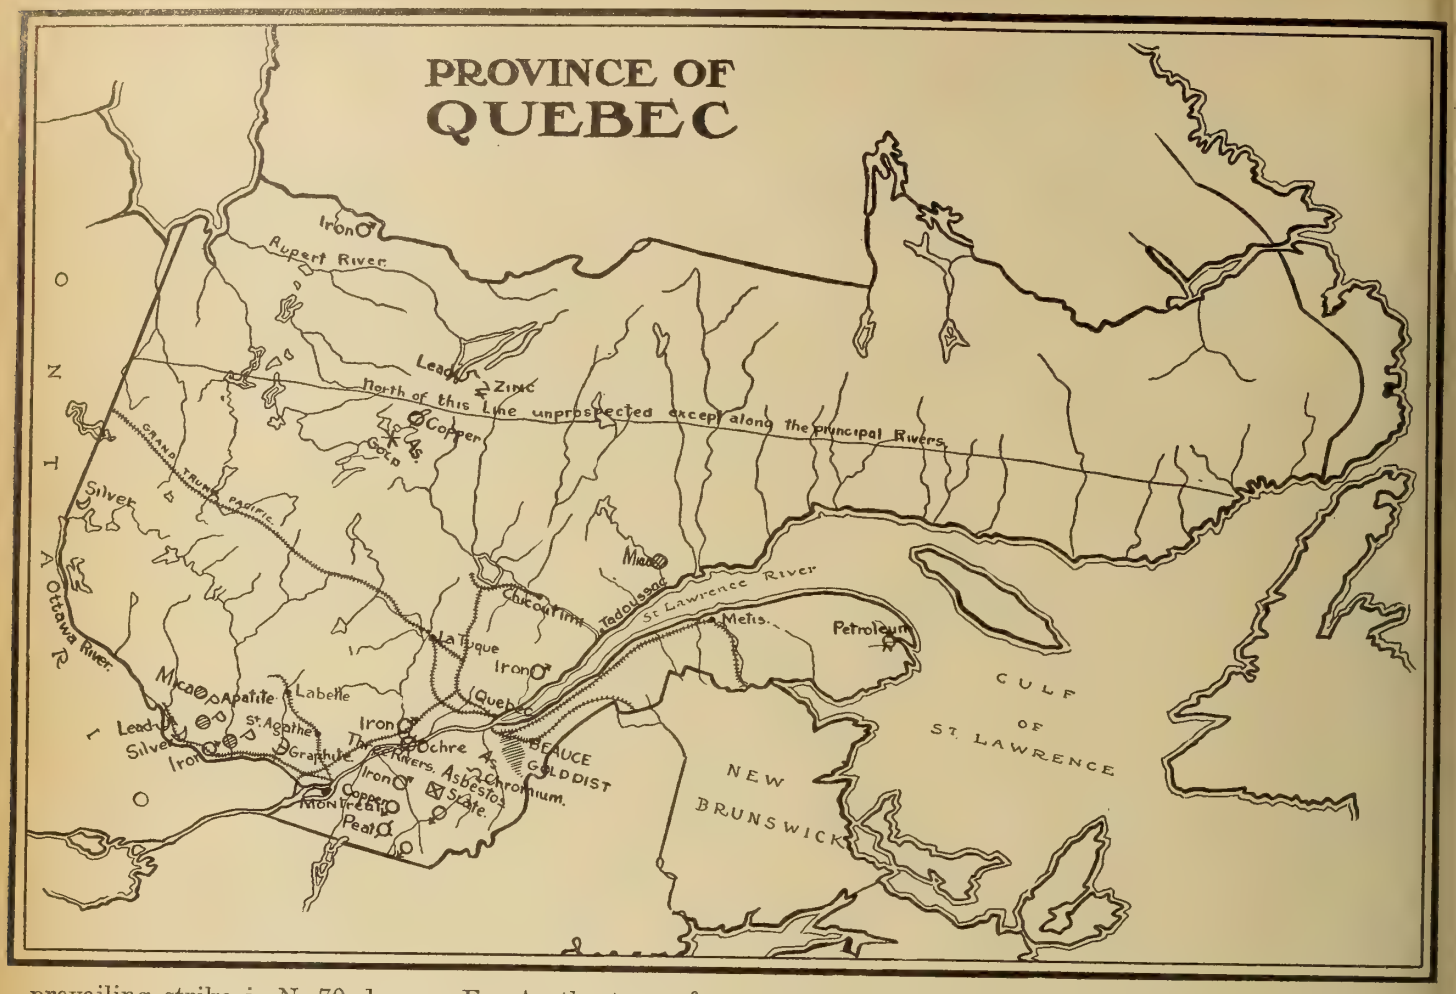
Comparing Canadian conditions with those in Britain, it may also be said that, while considerable progress has been made in mine rescue work in Canada, a great deal still remains to be done. It is pleasing to note that the British Columbia Government has taken up the matter and that several stations are being fitted up in that province. In Nova Scotia there are the stations of the Nova Scotia Steel & Coal Company and the Dominion Coal Company. At least one of the mainland coal companies of Nova Scotia, it is understood, has in contemplation the provision of a station. A joint station for the counties of Cumberland and Pictou was mooted some two or three years ago, but, so far, nothing has been done.

Up to the present time there has been no great enthusiasm shown in Canada in connection with first-aid or ambulance instruction. A branch of the Order of St. John of Jerusalem has been in existence in Montreal for several years, but nothing like the interest that is shown in this work in the coal fields of Durham and Yorkshire, and which is, also, at the present time, being taken up enthusiastically in Pennsylvania—has as yet been manifested in Canadian mines. During the last two winters, ambulance instruction has been given in the Cape Breton coal fields by the colliery doctors. The success of this enterprise was hindered by the disturbed labour conditions that existed for some time, but it is hoped that the ensuing winter will see a revival of such an extremely necessary and laudable work.

The Jersey Falls Gold Mining Property—Beauce County Quebec

Abstract of an Old Report.

Had the facilities for creating a mining boom been as complete half a century ago as they are now, I have reasonable belief that the roar of stamp-mills would be heard in eastern Quebec. There are many old inhabitants, indeed, who can remember the time stamps did drop in the Chaudiere Valley. Within the last thirty years, two or three small mills were in commission. But it is only during the past twelve months that active interest has been aroused. It is a curious fact that capital created and put in circulation by the new fields of Northern Ontario, is now being directed eastward towards the almost forgotten goldfields of old Quebec.



In view of this latter fact, I have put together a few notes from a report written in 1867 by Professor Henry Y. Hind. This report, printed in Boston, comprises Professor Hind's opinion of the Jersey Falls Gold Mining Property, several maps, and a list of assays made by Dr. A. A. Hayes, state assayer for Massachusetts.

The report is addressed to Mr. J. N. Maynard, and covers a tract of 2,300 acres on the Chaudiere River, in the Townships of Jersey and Shenley, County of Beauce. Within the boundaries of this tract are the Grand and Lower Falls and a series of rapids above the Grand Falls. Thus there was, in Professor Hind's opinion, ample power for all future purposes.

The Stafford stream, only about fifteen feet wide, with a total fall of 215 feet, within a mile from its mouth, joins the Chaudiere on the Jersey side, after intersecting several hundred acres of the property. The Chaudiere, at summer level, is 120 feet wide, and has an average depth of 18 inches.

The rocks, belonging to the upper members of the Upper Silurian series, are clay slates interstratified with sandstones. The prevailing dip is S. 20 degrees E. at angles varying from 65 to 85 degrees.

The interbedded strata are folded in a series of great curves, with a general northwesterly inclination. The

prevailing strike is N. 70 degrees E. As the tops of these folds have been denuded, the dips are almost always to the southeast. A belt of disturbed strata, about 780 feet wide, runs with the stratification. This belt was thrown into a series of folds before the general folding referred to above.

A series of faults or dislocations, having a general course, nearly at right angles to the stratification, show sometimes considerable downfall, and contain quartz veins.

The Veins.

The veins are of two kinds. Dr. Hind describes them as the Strike Veins (interbedded), and the True Veins (fissure) in the faults.

The Strike Veins run with the stratification, are of varying thickness, and are continuous. They range from a few inches to several feet in thickness. Their depth does not exceed 1,200 feet. In cases they are shallower. They occur in groups, and there are more than ninety on the property. They resemble in structure the gold-bearing veins of Nova Scotia. Essentially segregated, they have derived their minerals from the surrounding rocks by aqueous action. Among the minerals are galena, pyrrhotite, pyrite, zinc blende, and occasional traces of copper. With the quartz are small quantities of calcite, gypsum, and chlorite. Visible gold was not detected, but the existence of angular particles of the metal in nearby alluvions points to the veins as having been the original source.

Outside of the disturbed belt, the strike veins are perfectly regular between the dislocations.

The Faults.

Six faults, in each of which is a quartz vein, have been discovered. These may be of great depth. Where considerable downfall has occurred, the vein sometimes expands to many feet in thickness. The fault veins contain much more calcite than do the strike veins, and at intersection points of the two systems important metalliferous deposits may be looked for.

The Alluvions.

The order in which the alluvions occur is as follows:

1. Surface drift, with boulders of northern origin.

2. Stratified marine estuary deposits upwards of 100 feet thick, containing 25 to 35 feet of gold-bearing gravels below a belt of stratified blue clay 40 feet thick, and overlying,

3. Glacial drifts, consisting of very compact unstratified blue clay, holding boulders of northern origin, reposing on the country rock.

4. Modern river alluvions derived from Nos. 1, 2 and 3, and from the country rock.

Nos. 1 and 4 are gold-bearing, and require special notice.

The Modern River Alluvions.

These occupy the beds and banks of the River Chaudiere. Dr. Hind asserts that they are important and will amply repay working. He instances a case where, in 1851, a property within 3 miles of the Jersey Falls estate, yielded $4,323 from one acre. The "Long Tom" washing process was used. The working profit was $1,-366. Thus the gold won was $1.33 per cubic yard, at a cost of 90 cents.

In the light of modern conditions the figures next quoted by Dr. Hind are interesting. Taking Californian practice, he estimates a miner's wages at $4.00 per day. Then the comparative cost of handling a cubic yard of gravel is as follows:

I.—With the Pan	$20.00
II.—With the Rocker	5.00
III.—With the Long Tom	1.00
IV.—With the Hydraulic Process	0.20

Adapting these figures to Quebec (then, of course, Canada East), he notes that current wages are $1.00 a day, whilst, parenthetically, he informs us that 80 cents was the current wage in August, 1867. Thus the Californian figures become:

I.—With the Pan	$5.00
II.—With the Rocker	1.25
III.—With the Long Tom	.25
IV.—With the Hydraulic Process	.05

From these figures, Dr. Hind feels encouraged to conclude that modern methods would recover $400,000 from the river alluvions on the Jersey Falls estate, at a cost of $62,200. His estimate is based upon the assumption that the Jersey alluvions are as rich as those in the Du Loup.

The Marine Estuary Alluvions.

These alluvions assume the form of cliffs on the Shenley side about 100 feet in height. They consist of eleven feet of barren gravels, underlaid by forty feet of sterile stratified blue clay, which rests on about thirty feet of gold-bearing gravels. These in turn overlie a rich auriferous bed of blue clay, or a rich surface of glacial drift.

The greater part of the gold, so Dr. Hind believed, has accumulated on the surface of the blue clay. Where the blue clay is absent the gold has accumulated on the glacial drift.

An average gold content of ten to twelve cents per cubic yard would pay, according to Dr. Hind's contemporary estimate. Ample water was available. He, therefore recommended strongly the exploitation of the gravels.

Samples of quartz assayed by Dr. A. A. Hayes and by S. Dana Hayes gave results ranging from $11.79 of gold per ton up to $19.79. In one case a sample showed 16 ounces of silver per ton, along with $13.47 in gold. These samples were taken from five veins.

ONTARIO BUREAU OF MINES REPORT.

Returns to the Bureau of Mines show that the output of the metalliferous mines and works of Ontario for the nine months ending September 30th, 1910, was as follows:—

	Quantity.	Value.
Gold, ounces	1,390	$ 28,729
Silver, ounces	19,791,033	9,792,669
Cobalt (paid for) tons of 2,000 pounds	275	44,884
Copper, tons of 2,000 pounds	7,168	1,022,436
Nickel, "	13,905	2,989,651
Iron Ore "	120,358	273,906
Iron Pyrites "	16,454	44,690
Pig Iron "	319,698	5,039,626
Steel "	245,566	5,830,896
Zinc Ore "	700	5,760

Shipments from silver mines aggregated 23,824 tons, of which 19,191 tons were of ore and 4,633 tons of concentrates. The former averaged 768 ounces of silver to the ton and the latter 990 ounces. Gowganda, with six shippers, contributed 402 tons of ore, containing 334,210 ounces of silver. Elk Lake contributed 17 tons of ore, South Lorrain 9, and the Lake Superior district a small production, the remainder being from Cobalt proper. The output of metallic silver from the mines of the Cobalt camp is increasing, being 468,887 ounces for the nine months. During the period 7,069 tons of ore (containing nearly 50 per cent. of the total silver yield) were treated by the silver reduction works at Thorold, Trout Mills, Copper Cliff and Deloro.

The production for the corresponding period of 1909 was 18,751,549 ounces of silver, valued at $9,385,600.

The gold production shows a considerable increase, the greater portion being from the new Porcupine camp. For the corresponding period in 1909 the production was 1,125 ounces valued at $18,926, while this year the return shows 1,390 ounces, valued at $28,729.

The nickel-copper mines of Sudbury turned out 13,905 tons of nickel, and 7,168 tons of copper, as compared with 8,912 tons of the former and 5,587 tons of the latter for the same period in 1909, showing an increase of 56 per cent. and 28 per cent., respectively.

The production of pig iron as compared with the first nine months of 1909, shows a considerable increase, the figures being 319,698 tons, having a value of $5.039,626, as against 294,698 tons valued at $4,095,735 last year.

TORONTO BRANCH, C.M.I.

The second meeting of the Toronto Branch of the Canadian Mining Institute was held at McConkey's Restaurant, at 1 p.m., Saturday, Nov. 19th. Twenty-five members were present. Mr. H. E. T. Haultain occupied the chair. Professor W. Nicol, of Kingston School of Mining, was the guest of the day. After luncheon had been attended to, Professor Nicol spoke briefly and appropriately. He glanced over the progress of mining in Ontario, referring particularly to Cobalt, Porcupine, and Hastings County; and alluded to the present healthy condition of the mining industry.

The meeting then became informal. A discussion on the bearing of reciprocity on mining was led by Mr. J. J. Harpell. It was decided to make this a subject of debate at the regular meeting on December 17th, when Mr. Harpell will read a short paper.

Mr. Eugene Coste and Col. A. M. Hay emphasized the importance of a Dominion Mineral Act. Col. Hay urged strongly the need of a Royal Commission to study the mining legislation of all important countries with a view to consolidating the Dominion Acts and all the provincial Acts on the best possible basis.

Mr. Coste urged immediate action to be followed later by the appointment of a Royal Commission. A definite Act is needed now.

Dr. W. G. Miller advised action on the part of the Canadian Mining Institute. The subject is to be taken up more fully at the next meeting, December 3rd.

PEBBLES FOR TUBE MILLS.

Flint pebbles for tube mills, cement grinding and granite polishing come from the Orkneys, Greenland, Denmark, and largely from France. In the granite polishing trade the use of pebbles has been superseded by toughened shot and saws, and on the Rand by the use of the pebbles in the banket. The French deposits cover a distance of over a hundred miles on the beaches between Havre and St. Valery-sur-Somme. These pebbles are extremely hard, and occur in the cretaceous chalk formations. They are shipped in large quantities to Australia, New Zealand and America.

Gold pannings can be collected with a small globule of clean mercury, which can be transferred to a small bottle. Foreign matter can be removed by passing the globule from one cup to another. It can then be dissolved in nitric acid and the gold residue left as powder. The residue is then ignited and weighed.

Ore Receipts at British Columbia Smelteries

The total quantity of ore received at the several smelteries operating in the Kootenay and Boundary districts of British Columbia during nine months to October 1st, 1910, compares favourably with that for the corresponding periods of 1909 and 1908, respectively. The tonnage figures for the different smelteries and periods are as under:

Smeltery.	For nine months ending Sept. 30, 1908.	1909.	1910.
Consolidated, Trail	227,997	302,353	351,413
Granby, Grand Forks ...	786,852	728,447	871,255
B. C. Copper, Greenwood	224,203	203,065	279,785
Le Roi, Northport	59,631	9,301	.....
Total	1,298,683	1,243,166	1,502,451

These figures, which have been taken from the statements of ore receipts printed in the Nelson Daily News, show that the total for the nine months lately expired is approximately 260,000 tons higher than that for the corresponding period of 1909, and 204,000 tons higher than for 1908. Whether or not a proportionate rate of increase will be maintained to the end of the current year, is uncertain, but it is probable it will be, notwithstanding that the output of two or three mines that in other years were important producers is likely to be less for the closing three months of this year than in the two other years under notice. The suggestion that proportionate tonnage figures will be maintained is based on the fact that several mines not shippers in other years are among this year's producers.

It should be kept in mind that the foregoing figures do not exhibit the total production of ore for the whole province, but only the tonnage of ore sent to the smelteries mentioned. In addition, there is the ore that has been put through stamp mills or concentrators in East and West Kootenay—roughly 170,000 to 180,000 tons—and that from mines in the Similkameen and Coast districts. It would, therefore, appear to be quite reasonable to place the total tonnage of ore produced by the metalliferous mines of the province during the nine expired months of 1910 at between 1,700,000 and 1,750,000 tons.

It is on official record that the gross tonnage of ore mined in British Columbia in 1908 was 2,083,000 tons, and in 1909, 2,057,000 tons. Should nothing happen to interfere with production at present rate, the total for 1910 should be about 2,300,000 tons.

Personal and General

Mr. R. B. Lamb visited Cobalt recently.

Mr. A. H. Smith has returned from Porcupine.

Mr. O. E. LeRoy was in Toronto on Saturday, November 19th.

Mr. H. Kilburn Scott has left for Brazil on professional business.

Mr. John Shaw has been appointed superintendent of the Casey Cobalt.

Mr. J. H. Plummer has been elected a director of the Bank of Nova Scotia.

Mr. W. Stanley Lecky has moved from Montreal to Toronto. Mr. Lecky has been engaged by a Toronto syndicate to inspect mining properties.

Mr. Charles Watson, formerly manager of the Cobalt Townsite, has been appointed manager of the Armstrong-McGibbon property in North Tisdale, Porcupine. He is succeeded in the Townsite by Mr. A. C. Bailey.

Mr. Osmond E. LeRoy, of the Geological Survey, having completed his field-work in British Columbia for 1910, left the West about the middle of November on his return to Ottawa.

Mr. G. A. Guess, late of the Tennessee Copper Company, was entertained at luncheon at the National Club, Toronto, by Mr. H. E. T. Haultain on Thursday, Nov. 24th. Dr. W. G. Miller, Mr. R. W. Leonard, and Mr. J. C. Murray were also present.

Mr. J. A. Reid, who spent the summer in Portland Canal, was in Toronto on November 15th completing arrangements to take up mining property in Mexico. Mr. Reid is a graduate of Kingston School of Mining, 1902, and has spent some years in Mexico and in Western Canada.

Mr. Wm. Yolen Williams, of Spokane, Washington, formerly superintendent of the Granby Company's mines at Phoenix, B.C., recently went to Observatory Inlet, near Portland Canal, B.C., to determine what development work shall be done by the Granby Company on the Hidden Creek Copper Company's mine, now under option to the Granby Company. Mr. O. B. Smith, jun., present mine superintendent for the Granby Company, afterwards joined Mr. Williams at the mine.

Mr. James Gray, formerly manager of the Nicola Valley Coal and Coke Company's Middlesboro colliery, in Nicola Valley, B.C., is now manager of one of the Canadian Collieries (Dunsmuir) Limited's coal mines at Cumberland, Vancouver Island.

Mr. Howard W. Du Bois, of Philadelphia, Pa., U.S.A., who is general manager and engineer for the Quesnelle Hydraulic Gold Mining Company, was in Victoria, B.C., recently.

Mr. H. K. Rodgers, of Seattle, Washington, who owns a one-fifth interest in the Hidden Creek Copper Company, lately proceeded to the company's mine on Observatory Inlet, to give charge of the property to the Granby Company's officials, who will further develop it.

Mr. F. N. Sylvester, hydraulic and electrical engineer, has been appointed assistant to Mr. Jay P. Graves, general manager of the Granby Consolidated Mining, Smelting and Power Company, Limited. Mr. Sylvester will have charge of the commercial business of the company, leaving the superintendence of the company's mines and smeltery as at present.

Among recent visitors to Sheep Creek mining camp, in Nelson division, B.C., were Messrs. W. M. Brewer, of Victoria; Robert R. Hedley, of Vancouver, and S. S. Raymond, of Los Angeles, California. For several years Mr. Raymond was manager of the Britannia Smelting Company, with works at Crofton, Vancouver Island.

Mr. A. J. McMillan, liquidator of the Le Roi Mining Company, left British Columbia early in November on a business visit to Chicago, Illinois.

Mr. Norman McKenzie, superintendent of No. 2 district for the Dominion Coal Company, has been granted an extended leave of absence. He will visit the principal coal mines of the United States, with a view to studying provisions for safety of life in mines.

In our "Personal and General" column in our last issue reference was made to the suit of Smith vs. Hersey et al. In this paragraph the case was summed up inaccurately. A friendly settlement was effected at the suggestion of Chancellor Sir John Boyd. After the settlement had been arranged the charges preferred by Mr. Smith were withdrawn.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Dominion Coal Company Employees' Benefit Society.—The regular quarterly meeting of this society was held at Glace Bay on the 14th November. The treasurer reported that all the collieries and departments were organized into branches of the society, with the exception of a few scattered departments which will be gathered into a general branch. It is now four months since the old societies were amalgamated, and the result of the quarter's work is very satisfactory. The net excess of income over expenditure, after allowing for liabilities contingent or contracted on claims during the quarter, amounted to $7,448. The total funds to the credit of the society at the end of October amounted to $83,204. It was decided to create a reserve fund, and $50,000 was set aside for this purpose. For the purpose of forming the nucleus of a fund to provide for old age pensions and disability, the sum of $25,000 was further set aside. The number of members of the Benefit Society is now 6,700, and by the beginning of 1911 it is expected that this number will be increased to 7,500 members.

The Dominion Coal Company is adding to the equipment of its rescue station a motor-driven oxygen refill-pump. The station is at present equipped with a hand pump, with which the one-hour flasks which form part of the apparatus are charged from the main storage bottles. The work of pressing up the oxygen charge is necessarily slow and somewhat laborious, and it is not considered wise to have the station dependent on one pump. The new pump will be of a greater capacity, and will form part of the permanent equipment of the main station, thus allowing the smaller hand-pump to be available for transportation to any place required.

A new set of Draeger apparatus, "1910 Model," has also been ordered. This model is fitted with one large oxygen flask instead of the two which form part of the older type of apparatus. The potash cylinders in the older type were also two in number, but in the latest model their place is taken by one large cylinder. Both the potash cartridge and the oxygen flask can be changed in half a minute in smoke without the necessity of removing the apparatus from the shoulders. The helmet is also improved. Part of the metal in the old type of helmet is replaced by soft leather, and the whole pneumatic lining which is the distinctive feature of the Draeger apparatus is made so that it can easily be removed and replaced again.

Reciprocity in Coal.—The people of Cape Breton who are vitally interested in the prosperity of the coal trade and the allied steel industry, upon which the continued welfare of Cape Breton almost entirely depends, have taken decided measures to present their case before the Government at Ottawa. A meeting was held in Sydney on the 10th of November, at which were present the mayors of Sydney, Glace Bay, North Sydney, Sydney Mines and Louisburg, the warden of the county, Mr. M. J. Butler, the general manager of the Dominion Iron & Steel Company and the Dominion Coal Company, and representative deputations from the lodges of the Provincial Workmen's Association. The following resolution was unanimously adopted:

"Whereas, the question of reciprocity between Canada and the United States is now under consideration, and

"Whereas, the prosperity of Cape Breton is dependent on the coal industry, and the revenue of the province of Nova Scotia is in a large measure derived from the industry; and

"Whereas, the capacity of this section of the Dominion to purchase provisions and manufactures, the products of the western provinces, thereby developing interprovincial trade, is dependent on the coal industry; and

"Whereas, reciprocity in coal between the United States and Canada, or reduction of Canadian duties on coal, would be disastrous to the Nova Scotia coal trade;

"Resolved, that this meeting is opposed to any change in the existing coal tariff, and to any reciprocal arrangement which would include coal;

"Resolved, that copies of this resolution be forwarded to the Honourable the Minister of Finance, Ottawa, and to the Provincial Secretary of Nova Scotia."

Mr. Butler stated that the Dominion Coal Company had made most determined efforts to place its coal in New England, urged thereto by the necessity of providing work for the men during the winter and, to some extent, equalizing the winter and summer shipments. The result had been most absolute failure, and the only thing the company had accomplished was to enable the Boston & Maine Railway Company to use its quotation as a club to beat down American coal companies to cheaper prices. Mr. Butler expressed the opinion that the agitation for reciprocity in coal emanated from the two great railway systems of Canada. He did not believe that there was any real wish in the Province of Ontario for reciprocity in coal, and he felt that the business men of Ontario realized that anything which acted to the detriment of the prosperity of the Maritime Provinces would, at the same time, react most adversely upon the business done by Ontario manufacturers in the Maritime Provinces.

Mr. Butler made the striking point that reciprocity in coal with the United States would mean a readjustment of the east to west transportation between the Canadian provinces. A north to south exchange of commodities would completely destroy the great systems of railway transportation which have been built up by the efforts of the people of Canada.

The meeting was entirely unpolitical—every shade of party being represented—and there was complete unanimity of opinion that any interference with the coal duties would be no less than calamitous in its result upon the Maritime Provinces.

QUEBEC.

Sherbrooke.—The East Canada Smelting Company is pushing the development of the McDonald mine, at Weedon. It is stated that there are some hundreds of thousands of tons of ore in sight, in addition to ore indicated by diamond drilling.

A contract has been let for digging a canal seven miles in length, so reports go, for working gold-bearing gravels in the Chaudiere district. Several transactions are pending in this region. The favourable report of a Montreal engineer has again come to the fore, and will probably be acted upon.

ONTARIO.

Cobalt.—The Casey Cobalt, the only property mining silver in the clay belt, has already shipped this year nearly 50 tons. It has gone out in O'Brien and Cobalt Townsite cars so that until investigation was made nothing was known of the little mine's productiveness. As all of the ore was of high grade it should net the company a comfortable sum. Mining operations are being conducted at the 200-foot level and the ore appears to go down. Shipments were made in January, April, July and October.

At a meeting of the Wyandoh Mining Company the following directorate was elected: Messrs. Alex. Pringle, John P. Black, Dr. Milton Hersey, O. H. Ward, B. Neilly and Shirley Ogilvie. The report showed ore on hand $820, in treasury $11,000 and 500,000 shares of stock, and the company owed between $18,000 and $20,000. The shipment made netted the company $11,800.

In the thirty miles of trenching upon the Nipissing last year eleven veins all showing high grade were uncovered. One of these, in the keewatin, in the southwest corner of the territory had an ore body 25 feet long by three inches wide of very rich ore. It has been sunk on, and at the 100-foot level a cross-cut has been started to catch the vein which dipped out of the shaft. Four parallel veins near Peterson Lake are being mined from tunnel 28. The ground covered included some hitherto unexplored keewatin territory, some partly explored conglomerate, and 3,500 feet in the diabase only. The average depth of the trenching was 2.8 feet. Next year all the surface prospecting will be done by means of hydraulicking.

In drifting on the Lavalle vein on the 150 foot level of the T. & H. B., near the Trethewey line and heading for it a five-inch vein of 3,000 ounce ore has been cut. It has been opened up now for 430 feet right to the Trethewey line. The mill building at this mine has been completed and half the machinery is on the ground, while the remainder is ordered. For the concentrator there is 12,000 tons on the dump and a large tonnage of low grade has been stoped in the mine itself. This is the fourteenth concentrator to be erected in camp and there are plans being made for two more, one at the Crown Reserve and the other at the Nipissing.

Quite a number of changes have been made in the management of Cobalt properties. Mr. Charles Watson, formerly of the Cobalt Townsite, goes to take charge of the Armstrong McGibbon at Porcupine at the beginning of the month; Mr. A. C. Bailey leaves the Casey Cobalt to take his place at the Townsite, and Mr. John Shaw will be manager of the Casey.

As the Cobalt Provincial now has a continuous ore body of over 200 feet at the 175-foot level, Mr. Reddington has thought developments warrant the erection of a good camp and a small sorting house to look after 40 tons a day. The vein is of high grade ore from three to six inches wide and outside its values extend for sixteen feet in several spots in the drift. Twenty tons of high grade have been taken out of a stope on the upper level and two cars of seconds are on the dump. The camp is being built to accommodate sixty men.

The Little Nipissing has cut its vein again at the 285-foot level and report it to be as rich as ever and six inches wide. The company has on hand three cars of ore of which one-third of a car is high grade.

The Cobalt Provincial Mining Company has secured an option from Messrs. Fraser and Ogilvie on lot A53. There is opened up on it 25 feet of a one-inch vein. The showing was supposed to be the best of any of the lots offered for sale at the last sale of property by the Government and brought $35,100.

On the fifth or lowest level of the Kerr Lake, No. 3 shaft near the Hargrave boundary, a new vein of high grade ore has been cut. Under Kerr Lake, where previously nothing had been done, a cross-cut has revealed the existence of several very rich veins, in all probability, the extension of some of the Crown Reserve's veins.

The largest shipment of bullion made from any one mine at one consignment was that from the Crown Reserve when they shipped 65 bars, containing 45,000 ounces, to England. It came from their coarse metallics from their small sorting plant.

Buffalo interests have leased the Green-Meehan on terms that appear to be favourable to the discovery of more ore if there is any left at all. In the five years of their lease the syndicate has to do 120 feet development in the first year and gradually increase the extent of the exploration each year until the fifth year when 275 feet at least must be done. Unless there is again a hitch, active work will be commenced at once.

The Beaver Consolidated has issued a statement showing that there was on hand at the end of October $30,000 in cash, $30,000 due from the smelter and another $30,000 car ready to ship.

During the month of September the Nipissing produced 351,849 ounces, having a value of $185,219. Development during the month has mainly been on the Meyer, which now shows a 212-foot ore body.

Surface conditions on the Nipissing are:—

	Partially Prospected.	Unprospected.
Conglomerate	306	123
Keewatin	176	10
Diabase	16	225

The Ophir Cobalt Company has been fined $100 for not providing a guard rail at its 200-foot level. A man named T. J. Kinsey fell down into a winze and was killed. The Beaver Consolidated was also reprimanded by a jury for not seeing that the guard rail at the shaft was kept down and in place. A man was killed there.

The McKinley-Darragh-Savage has already mined this year two million ounces of silver in the first ten months of the year. From the Savage mine a regular output of between 50,000 and 60,000 ounces is being maintained per month.

Two gold prospects outside the Porcupine area report continued good showings. These are the Swastika mine near Dane, on the T. & N. O., and the Thelma mine, in Bryce Township. At the Swastiki the manager has gone to Nova Scotia to buy a second-hand mill of five stamps in order that they may extend operations. At the Thelma Gold Mining Company, midway betweent Cobalt and Elk Lake, assays continue good as test pits are put down on a two-foot vein.

A contract has been let to sink a shaft on the Valentine Mines at the southwest end of Cross Lake. The shaft will be put down a hundred feet to crosscut several good sized veins found on the surface.

Pennsylvania detectives are looking into the affairs of the Delaware Cobalt Mining Company with properties somewhere near Gillies depot. The properties were bought for a few hundred dollars by the promoters and resold to the company, capitalized at $2,000,000, for $21,000. Much stock in the company, on extravagant representations, was sold to Easton, Pa., people, who are now beginning to make enquiries.

The O'Brien mill is now treating 120 tons a day and getting an extraction of 93.4 per cent. from 30 ounce ore.

Fourteen shipments of bullion have been made from the mill, consisting of 288,405.78 ounces, worth $153,028.49.

Porcupine.—Until the trail is better and supplies are cheaper and more easily obtainable, the Dome has got rid of most of the men employed. Probably this winter work will be confined to the erecting of a mill and big plant. A twelve-drill compressor has been ordered from the Canadian Rand Company.

By the time this appears in print the trail to Porcupine for sleighs and passenger traffic should be excellent. A new winter trail is being cut from Crawfords on the Frederickhouse to Hills on the Porcupine, and should be completed by the end of the month.

Two men were drowned in the Frederickhouse River, one in trying to break through ice with a canoe, the other in endeavouring to cross the river on thin ice.

Work on the Miller Middleton properties of the Timmins shows that the gold showings go down for at least thirty feet on those properties. Below the 100-foot level of the main shaft a winze is being sunk. It has been put down 30 feet and is still in excellent ore.

An English company represented here by the firm of Rose Van Cutsen & Company, has staked Pearl Lake near the Timmins holdings and Simpson Lake near the Foster. The intention is to prospect under them in a few days.

The demand for claims in the Porcupine area in Tisdale, Whitney, Shaw, the Reserve, and even in Carman and other townships, has never been so keen. Many important sales have been

made and many more are reported. Before the snow flew it was remarkable the number of gold showings discovered. But now the snow hides all the reports have increased tenfold.

There is still much discussion as to the route the electric road being built into Porcupine by the British Canadian Power Company will take. But the cutting of the right of way from Iroquois Falls to the Frederickhouse Lake has commenced and sixty teams have been purchased to commence grading.

The T. & H. B. Mining Company has purchased the six Foster-Ellis claims in Porcupine in Shaw Township, it is reported, for $30,000. The T. & H. B., in addition to the main mine at Cobalt, have properties at Hangingstone and Porcupine now.

Many Porcupine companies are being incorporated. Some of them are: Ontario Northern Mines, Sault Ste. Marie, $100,000; Porcupine Three Nations Gold Mining Company, Ottawa, capital $1,500,000; King Porcupine Mines, Toronto, $500,000; Pearl Lake Gold Mines, Toronto, $2,500,000.

The Porcupine Gold Mines has acquired the McDonald claims and will develop them in connection with the Vipond holdings.

The Porcupine Power Company, in which the Timmins syndicate is largely interested, states that it will be able to deliver power by June 15 next year. Contracts have been let for the plant to be installed at Sandy Falls, on the Mattagami. Two units will be installed, which will furnish about three thousand horse-power.

South Lorrain.—After a summer of reticence from the Wettlaufer mine, being worked by the Lewisohn interests, it is now learned that developments have been most satisfactory. Below the 250-foot level in a winze now sunk 30 feet, a vein of bonanza ore shows from a foot to a foot and a half wide. For a week the mine was producing 30,000 ounces per day. The Wettlaufer has been shipping much ore recently, but here again official reticence steps in the way of definite statements.

Owing to a disagreement among the directors of the company, the Haileybury Frontier mine has shut down. The Frontier will probably start up again as soon as power arrives, as it is one of the best prospects in South Lorrain.

Elk Lake.—The Lucky Godfrey and Mackenzie Syndicate has shut down, and the chief operating companies are now the Devlin and the Moosehorn. The latter has made a small trial shipment of ore. Some good finds are reported in Willett Township.

It is reported that the Otisse, Currie, and the Gavin Hamilton will pay their creditors. The good news from Porcupine has drained off many men from the Elk Lake and Gowganda fields.

Gowganda.—The principal news from Gowganda is in regard to the favourable developments at the Gates or Miller Lake-O'Brien. There is a high grade vein six inches wide at the 150-foot level of this property, and it will probably be a shipper this winter.

BRITISH COLUMBIA.

Nearly all the Geological Survey officials who have been working in the West this year have left to report to the director at Ottawa. Much useful work has been accomplished, both topographical and geological, and British Columbia in particular will derive benefit from the various investigations of topographers and geologists. The publication of the several reports and maps will be awaited with much interest.

Cariboo.—The Quesnelle Hydraulic Gold Mining Company is making good progress towards the completion of its works to bring in water from Swift River for hydraulicking purposes on its placer mining leases near Quesnel River, about 20 miles below Bullion. Of the 17½ miles of ditch, flume and pipe line, from the intake on Swift River to the pooling lake four or five miles above the ground to be hydraulicked, about 13 miles have been completed, and it is expected the remaining four to five miles will be finished in time for gravel-washing to be commenced next summer.

Slocan.—The agitation carried on for some time, with the object of inducing the Great Northern Railway Company to rebuild the destroyed parts of the Kaslo & Slocan Railway, which formerly connected Kaslo, on Kootenay Lake, with the town of Sandon, in the heart of the Slocan country, a distance of nearly 31 miles, has been resultless thus far. Strong representations have been made to both the railway company direct and the Provincial Government, and there have been communications passing between the Government and the railway company. It is too late now for anything to be expected this winter, but it is earnestly hoped the requisite work will be done next spring, at any rate as far as McGuigan, so that mines between Kaslo and the summit of the divide at Bear Lake may again be provided with railway transportation facilities to Kootenay Lake at Kaslo. Meanwhile horses and heavy sleighs have been procured by the Rambler-Cariboo Mines, Limited, for hauling ore over the newly-constructed wagon road from McGuigan to Three Forks, the latter being a station on the Canadian Pacific Railway Company's line from Sandon to Nakusp, on Arrow Lake. Much ore has been made accessible for shipment by the opening of new levels and the extension of old ones in the Rambler-Cariboo mine, so that production will be on a larger scale than for several years. Work is also being continued in the Washington mine, situated within a mile of the Rambler-Cariboo.

Around Sandon, the Richmond-Eureka and Ruth-Hope groups are the chief producers of ore this year, the Slocan Star not having shipped much of late. At Cody, the raise from the deep-level workings of the Surprise is still being made, and about half the distance to the old workings, 800 feet above, has been passed. Development of the Noble Five group is still in progress, and a report is current that a vein of ore several feet in width has been encountered.

The smaller mines about Sandon and New Denver, respectively, are nearly all closed for the winter, communication being difficult when the snow becomes deep. The Mollie Hughes is an exception, for it is only a little above Slocan Lake level, so can be kept open and worked with comparatively little trouble. In Four-Mile Creek camp, near Silverton, operations are being continued on three properties, namely, the Standard, Hewitt, and Van Roi. The last mentioned mine is not now taking out ore, for the term of the company's lease of the Wakefield concentrator has expired and construction of its own mill is not yet completed. However, the development of the mine is being carried on, so as to have plenty of ore available after completion of the new concentrator. The Wakefield mill is controlled by men largely interested in the Silverton Mines, Limited, which company is operating the Hewitt mine. During recent months ore has been shipped from the Hewitt to the Consolidated Company's smeltery at Trail, but not in considerable quantity, although there are large quantities of ore blocked out. The intention is to put much of the ore through the Wakefield concentrating plant and ship the resulting concentrates, which will be both silver-lead and silver-zinc. An interesting feature in the Hewitt mine is the occurrence of much ruby silver in the ore, the value of which is considerably increased by the presence of this rich mineral.

Lower down Slocan Lake there are only two mines attracting attention at present, those being the Eastmont group, owned by the Ellis Silver Mining Company, of Toronto, and Enterprise, which has been leased by Mr. S. S. Fowler, M.E., from the British company that owns it. Both these mines are in the vicinity of Ten-Mile Creek.

Nelson—A consolidation of a number of mining properties situated on Toad Mountain, near Nelson, has been effected, and a sale of them made to a strong syndicate. Several weeks ago, Mr. R. S. Lennie, for years a prominent citizen of Nelson, but now resident in Vancouver, was quoted by the Nelson Daily News as follows: "It is an absolute purchase which will positively be carried out, and the payment of the remaining 40 per cent. of the total price is guaranteed. The people I represent will absolutely own the properties. Work will be commenced just as soon as our engineers have completed their examinations,

and a method of treating the ore of the respective properties mine. thoroughly determined."

Other mines in the neighbourhood of Nelson worthy of mention are the Athabasca, Granite-Poorman, Eureka, and Ferrier group. The last of these is a property not yet much developed, having ore of high grade, and on which a small compressor has lately been placed.

Ymir and Sheep Creek.—These two camps, both in Nelson mining division, are more active now than for years, and both are adding substantially to the mineral production of the district, with much promise of their output being steadily enlarged. The shipping mines of Ymir camp are at present the Yankee Girl and Wilcox; among others that are being worked, though not shipping ore, is the Dundee, on which it is intended to install a compressor.

The Emerald, near Salmo, has sent about 1,700 tons of lead ore to Trail this year; it is the only mine in the southern part of Nelson division shipping lead ore. Below Salmo, in Erie camp, there are several properties, including the Second Relief, Arlington, and others that, unlike these two, have not made a continuous output of ore.

Sheep Creek camp is coming into more prominence as development work is proceeded with, but production is not general, the Queen and Nugget being the two chief shippers. The final payment on the purchase price of the Queen mine, which was $175,000, was made early in November, the amount paid then having been $71,428. The Queen-Yellowstone group and 20-stamp mill thereupon passed to the possession, absolutely, of the Wisconsin company, which has for more than two years been working the property. The Nelson Daily News quoted the president of the company as having said, in part: "The policy of the company will be to push development at an accelerated rate, not only in connection with the Queen vein proper, but on the numerous promising prospects which are included in our property. In past years shipments of ore have been made from the Alexandra, Hideaway, and Yellowstone veins. Our compressed air system will be at once enlarged, so that with air from our two compressors we may be able to operate hoist, pump and ten machine drills. It is well known that about 60 per cent. of the ore from the Queen mine is free-milling, that percentage of gold being caught on the plates and, except for the small quantity lost in the tailing, the remainder is recovered by the smeltery. If an addition to the stamp mill shall later be required, or a new mill of larger capacity become necessary, it will doubtless be provided. The provision of a cyanide plant to recover the gold from the tailing, will probably be made in the future."

It has been announced that the owners of the **Mother Lode**, which has been developed extensively during the last two years, are arranging to erect and equip a stamp-mill for this property, reports concerning which have been decidedly favourable. The provision of this treatment plant is expected to result in a substantial increase being made to the output of gold from this camp.

Rossland.—There is little to note of this camp, in which production of ore is being well maintained, and progress is being made. The total output of ore for the year to the middle of November was about 220,000 tons, of which approximately 165,000 tons came from the Consolidated Mining and Smelting Company's Centre Star group of mines, and 40,000 tons from the mines of Le Roi No. 2, Limited. Most of the remainder came from Le Roi, the production of several other mines having been small. Le Roi No. 2, Limited, paid another dividend on November 8th, amounting to about $60,000. Total paid to date is $1,065,000.

Boundary.—The aggregate output of Boundary district mines in 1910 will probably have reached 1,500,000 tons by the end of November. Fully two-thirds of this large quantity will have come from the Granby Company's mines, while nearly 370,000 tons will have been the share of the British Columbia Copper Company's several mines, and well on for 130,000 tons that of the Consolidated Mining and Smelting Company's Snowshoe

Similkameen.—The Hedley Gold Mining Company's Nickel Plate group is still the only ore-producing mine in this district. There are several other properties in Hedley camp that are regarded as promising to make profitable mines if money shall be available for their development, but at present this is lacking. The development of the coal resources of the district about Princeton and Granite Creek is being proceeded with. Mr. Arthur Hickling, managing director of the company owning the coal mine at Princeton, who lately came from England on one of his periodical visits to British Columbia, has been quoted as authority for the statement that his company has contracted to supply the Hedley Gold Mining Company with 10,000 tons of coal, and that next year the output from the Princeton colliery will be about 500 tons a day. Railway building in the upper part of the district, from the direction of Nicola Valley, is expected to considerably increase the importance of mining throughout that part. The coal mining industry in Nicola Valley is flourishing, with a steadily enlarging production.

Yale.—The new mining field, known as Steamboat Mountain, is not expected to make much progress until after the snow shall have melted next spring. Many mineral locations have been made, and several claims and groups of claims have been sold to men who can provide money to develop them. The occurrence of gold in quartz veins in the country lying between Hope, on the Fraser River, and the International Boundary line has been known for years, but its presence in the many porphyry dikes that exist was not recognized. Now, however, there is reason to think that some of these dikes will pay to work, and an effort will be made next year to prove whether or not they can be turned to profitable account. The quartz veins as yet discovered are not wide as a rule, though the ore contains good value in gold. There seems to be a reasonable prospect of the new field proving productive, but pending development of some of its properties this is necessarily as yet uncertain.

Coast.—There is nothing of especial importance to chronicle in connection with metalliferous mining in the Coast district. Work is being proceeded with at the Britannia mine, Howe Sound, and it is reported that late developments have been satisfactory. On Vancouver Island little, if any, mining is being done, so there is practically no ore production at present. The Tyee Copper Company's smeltery, however, is receiving supplies of ore from various sources, chiefly from southern Yukon and Alaska. In Portland Canal district, the most encouraging development is the continued successful operation of the Portland Canal Mining Company's concentrating plant, which is reported to be abundantly realizing expectations, in regard to suitability for recovering the valuable metals from the ore occurring in the company's mine. Some particulars of other properties in this camp, and in the neighbouring Observatory Inlet, are given in an article on mining in the Coast district sent by same mail.

A different account may be given of coal mining in the Coast district, to that above written relative to mining for metallic minerals. The Western Fuel Company, Canadian Collieries (Dunsmuir), Limited, and Pacific Coast Coal Mines, Limited, are all producing much coal. The first mentioned has had some temporary difficulty arising out of overheading in one part of its No. 1 mine, but this has been overcome and the miners are back again at work in the mine. The usefulness of the oxygen breathing apparatus provided here was demonstrated, for with it the underground troubles just mentioned were disposed of speedily and with much less loss in both time and money than would have been the case under old conditions, when without the advantage of the use of such appliances. The Pacific Coast Coal Company lately made its record daily production, that being an output of 1,000 tons of coal in one day, taken from its South Wellington mine, near Nanaimo. For a colliery that has been producing coal only about two years, this indicates creditable progress. This company is also developing another coalfield situated at Suquash, in the northern part of Vancouver Island.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

London.—A recent careful estimate figured out that for the nine months ending on September 30th there was a decrease of $800,000 in the world's gold production from the same period in 1909. At the same time it was suggested that this might be made up by increased output at the Rand mines during the last three months of 1910. Returns at hand show that for October, at least, the Rand fulfilled expectations. Output of gold there was $1,078,000 heavier than a year ago, and was the largest on record. Compared with three years ago, the month's output showed an increase of $2,100,000.

London, November 18.—The presence of William D. Haywood, of Idaho, a member of the Western Federation of Miners, in the Welsh coal fields, where extra police and military have been required to check the rioting of strikers, is interesting the authorities who have to cope with the situation. Considerable tension still prevails among the miners. A number of continental labour leaders are in the district, but the authorities are acquainted with their methods of conducting strikes, a knowledge of which is lacking in the case of American labour chiefs.

Cardiff, Wales, November 22.—The disorders in connection with the strike of the Welsh collieries in the Rhonda Valley are becoming serious. The rioters have attacked the houses of the mine officials, held up and searched trains, storming the signal boxes and keeping the signalmen prisoners while this was going on, and have threatened other outrages. There was a fierce conflict last night between rioters and the police at Ton-Y-Pandy, which was not quelled until the troops were summoned. Several policemen were severely injured.

AUSTRALIA.

Sydney.—The October gold yield of New South Wales is 17,423 ounces, valued at £59,641. The yield for the last ten months is 190,837 ounces, valued at £675,944.

Perth.—The Western Australian Government has decided to construct forthwith a temporary water pipe line from Southern Cross to the Bullfinch mine, where the gold discoveries were made recently. This line will provide an ample supply of water for domestic purposes. The Government has also decided to introduce a bill for the immediate construction of a railway to the Bullfinch centre via the Corinthian mine. Arrangements for the work are already being made by the department concerned.

CHINA.

The Pekin Syndicate announces that the output and sales of coal for the month ended 31st October, 1910, were as follows: Output, 33,400 tons; sales, 38,500 tons; boiler consumption, 3,250 tons.

UNITED STATES.

Cripple Creek, Colo., November 18.—Pouring out of the Roosevelt deep drainage tunnel at Cripple Creek is a flow of water estimated at about 2,000 gallons a minute. It is from the well of the El Paso shaft. The tremendous flow started at 3.45 o'clock yesterday morning and was followed by shrieking of whistles, blasts of dynamite and general jollification at the portal. Yesterday marked the real beginning of the draining of the deep levels of the Cripple Creek district and the recovering of $100,000,000 to $300,000,000 worth of ore. The water in the El Paso shaft has fallen about 75 feet from the old tunnel level. Of this distance, 50 feet was lowered yesterday morning and the drop is easily perceptible. There is little water now coming from the old tunnel. All work in the heading is being carried on through the intermediate shaft. At the portal of the tunnel the water is going out knee deep. At least 2,000 gallons a minute is pouring forth.

Houghton, Mich.—Edwin J. Hulburt, discoverer of the Calumet and Hecla mine, one of the most prolific copper producers in the world, is dead in Rome, Italy, according to advices received here. Mr. Hulburt was 81 years old.

Joplin, Mo.—Twenty-one camps were represented in the zinc and lead turn-ins from the Joplin district recently. The area of production extended from Aurora, Mo., to Miami, Okla., from Alba and Neck City on the north to Peoria on the south. The production tells a story of general activity throughout the entire Joplin district. It shows that operations are in progress in camps that are not always active, and when these conditions prevail nothing could tell more forcefully the story of the present prosperous times.

New York City, November 19.—J. Parke Channing, vice-president of the Miami Copper Company and consulting engineer of the General Development Company, has returned from an inspection of the Miami property at Globe, Ariz. He reports that while work on the mill has been delayed, the plant probably will be placed in operation in January. The mill, which is constructed of iron, and has cement foundations, has a capacity of 2,000 tons daily capacity, and the foundations for the 3,000-ton unit already have been laid. It is expected to treat 750,000 tons a year.

MEXICO.

Guadalajara, Mex., November 15.—Some ore is being shipped from the old Mololoa mine in the Hostotipaquilla district, the property of the Mololoa Mining Company, of Toronto, Canada. Work was recently resumed under the direction of W. M. Matthews. The Mololoa, which is a famous antigua, has produced some very rich ore during the last ten years. A fault interfered with profitable development for a time, and the mine was purchased by the Toronto interests from Carlos Romero, of Etzatlan, for $30,000. The mine has been the property of the Toronto company for over three years. Two additional tube mills have been ordered for the new reduction plant of the El Favor Mining Company in the Hostotipaquillo district of this state. They will make a total of four. There are twenty stamps, and with four tube mills for regrinding, coarse crushing will be done, and it is expected to handle up to 120 tons of ore daily. Some improvements are being made in the cyanide annex, with a view to the highest possible efficiency. The plant will go into commission as soon as electric power reaches the Hostotipaquillo district. The big El Favor mine, which has been systematically developed for several years, is in shape to supply any tonnage that may be called for. All levels have been given connection with the main transportation tunnel, and in anticipation of early milling, heavier track is being laid there.*

* Editor's Note.—The Mololoa and the El Favor mines were developed by two Canadian engineers—Mr. F. G. Stevens and Mr. S. N. Graham. Both are now in Canada. Mr. Stevens is in Kingston, Ont., and Mr. Graham is manager of the pyrite mine of the Canadian Sulphur Ore Company, Queensboro, Ont.

Parral, Mex., November 14.—The sale of the Hidalgo properties to a syndicate headed by A. J. McQuatters, of Dallas, Texas, once more brings this city into the limelight of trade and development. The Hidalgo properties are in the immediate neighbourhood of Parral and up to the middle of last month were controlled by Pittsburg men, with James I. Long as general manager. The mines have always been large producers and were worked steadily until July, 1907, when the company decided to close them on account of the large number of estates pending settlement among these stockholders.

KERR LAKE DIVIDEND.

Kerr Lake has issued the statement that the fourth dividend of the year will be made on December 15 at the old rate of 5 per cent. regular and 5 per cent. bonus. They will thus have paid 40 per cent. in 1910, or $1,200,000. Altogether, at the end of the year they will have paid 91 per cent., or $2,730,000.

COMPANY NOTES.

CROW'S NEST PASS.

For the first nine months of the present year profits of the Crow's Nest Pass Coal Company show an excess of over $100,000 over the corresponding period of last year. For the whole of last year profits were $145,000, which would make the profits for the first nine months of last year—if in proportion—$108,000. At this rate the total amount for this year to date is almost double that of last year.

Wyandoh stockholders met on November 15th in Montreal and elected the following directors: Alexander Pringle, John P. Black, Shirley Ogilvie, Dr. Milton Hersey, A. Pierce, F. H. Ward and B. Neilly.

The financial report as read showed 500,000 shares left in the treasury, about $11,000 cash on hand, and a balance of about $18,000.

The property produced one car of ore, netting $11,683 during the year. Ore on hand is estimated at $820.

MCKINLEY-DARRAGH.

The announcement of a 12 per cent. bonus and 3 per cent. regular quarterly dividend on McKinley-Darragh was made on November 22nd.

STATISTICS AND RETURNS

DOMINION COAL SHIPMENTS.

For the present season the Dominion Coal Company has shipped 1,228,000 tons of coal up the St. Lawrence.

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending November 11th, and those from January 1st, 1910, to date:

	Nov. 11. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	.....	226,217
Buffalo	62,530	2,068,878
City of Cobalt	.....	548,875
Chambers-Ferland	64,000	1,591,300
Cobalt Central	.....	293,286
Cobalt Lake	.....	300,900
Cobalt Townsite	.....	601,120
Colonial	64,150	309,730
Coniagas	.....	1,816,436
Crown Reserve	.....	5,314,140
Drummond	440,000	1,504,200
Hargraves	.....	564,070
Hudson Bay	.....	481,215
Kerr Lake	.....	9,059,468
King Edward	.....	263,406
La Rose	87,130	9,342,971
McKinley-Darragh	.....	3,599,449
Nipissing	446,620	11,051,177
O'Brien	.....	1,115,250
Peterson Lake (Little Nip.)	.....	497,420
Provincial	.....	65,000
Right-of-Way	.....	1,545,187
Rochester	.....	60,750
Silver Cliff	.....	268,720
Standard Cobalt	.....	258,951
Temiskaming	.....	1,913,350
Tretheway	103,870	957,490
Waldman	.....	63,992
Wyandoh	.....	48,300

Ore shipments for the week ending November 11th were 1,268,300 pounds, or 634 tons.

Total shipments from January 1st to November 11th were 55,731,248 pounds, or 27,865 tons.

Following are the shipments from the Cobalt camp for the week ending November 18th, and those from January 1st, 1910, to date:

	Nov. 18. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	.....	226,217
Buffalo	55,510	2,124,388
City of Cobalt	60,000	608,875
Chambers-Ferland	.....	1,591,300
Cobalt Central	.....	293,286
Cobalt Lake	.....	300,900
Cobalt Townsite	64,000	665,120
Colonial	.....	309,730
Coniagas	63,800	1,880,236
Crown Reserve	146,700	5,460,840
Drummond	440,000	1,944,200
Hargraves	.....	564,070
Hudson Bay	.....	481,215
Kerr Lake	60,240	9,119,708
King Edward	.....	263,406
La Rose	260,870	9,603,841
McKinley-Darragh	169,060	3,768,509
Nipissing	252,620	11,303,797
O'Brien	64,110	1,179,360
Peterson Lake (Little Nip.)	.....	497,420
Provincial	.....	65,000
Right-of-Way	60,100	1,605,287
Rochester	.....	60,750
Silver Cliff	52,680	321,400
Standard Cobalt	.....	258,951
Temiskaming	.....	1,913,350
Trethewey	.....	957,490
Waldman	.....	63,992
Wyandoh	.....	48,300

Ore shipments for the week ending November 18th were 1,749,690 pounds, or 874 tons.

Total shipments from January 1st to November 18th were 57,480,938 pounds, or 28,740 tons.

In addition to the ore tonnage 106 bars of bullion were shipped from Cobalt last week, this being probably the record for any one week since bullion has been shipped from the camp:

Buffalo mine, 9 bars, 12,912 ounces, value $5,750; Crown Reserve, 65 bars, 45,000 ounces, $24,268.67; O'Brien, 19 bars, 15,888 ounces, $10,230.55; Nova Scotia, 11 bars, 9,156 ounces, $5,579.96.

BRITISH COLUMBIA ORE SHIPMENTS.

The Aurora mine, at Moyie, made its initial shipment of the year the past week, to the Consolidated smelter at Trail, as disclosed by the returns.

The following are the returns of the ore production and movement for the week ending November 11th, and for the year to date:

Boundary Shipments.

	Week.	Year.
Granby	19,370	966,307
Mother Lode	7,160	306,139
Snowshoe	2,989	129,039
Jack Pot	350	13,251
Rawhide	3,200	19,100
No. 7	75	517
Other mines	.....	9,523
Total	33,144	1,443,876

Rossland Shipments.

Centre Star	3,739	166,566
Le Roi No. 2	597	27,453
Le Roi No. 2, milled	300	13,500
Le Roi	58	11,454
Nickle Plate	69	711
Other mines	.....	852
Total	4,763	220,536

Slocan-Kootenay Shipments.

St. Eugene, milled	2,775	124,875
Van Roi, milled	800	36,000
Queen, milled	420	18,900
Granite-Poorman, milled	250	11,250
Nugget, milled	110	4,950
Highland, milled	250	8,600
Wilcox	75	900
Richmond-Eureka	91	3,586
Standard	96	1,470
Emerald	21	1,661
Yankee Girl	192	4,663
Eastmont	30	649
Sullivan	428	18,373
Hope	28	205
Panama	37	55
Idaho-Alamo	32	103
Aurora	19	19
Other mines	.....	33,754
Total	5,654	270,013

The total shipments for the week, including the estimated milling, were 43,561 tons, and for the year to date, 1,934,425 tons.

British Columbia Copper Company's Receipts.
Greenwood, B.C.

Mother Lode	7,160	306,139
Jack Pot	350	13,251
Rawhide	3,200	19,100
Other mines	.....	9,339
Total	10,710	347,829

Granby Smelter Receipts.
Greenwood, B.C.

Granby	19,370	966,307
Other mines	.....	120
Total	19,370	966,427

Consolidated Company's Receipts.
Trail, B.C.

St. Eugene, concentrates	185	12,390
Le Roi No. 2, part concentrates.	597	27,453
Queen, concentrates	42	738
Centre Star	3,739	166,566
Le Roi	58	11,454
Snowshoe	2,989	129,039
Richmond-Eureka	91	3,586
Standard	96	1,470
Emerald	21	1,661
Yankee Girl	192	4,663
Eastmont	30	649
Sullivan	428	18,373
Hope	28	205
Nickle Plate	69	711
Panama	37	55
Idaho-Alamo	32	103
No. 7	54	496
Aurora	19	19
Other mines	.....	20,326
Total	8,707	399,957

The total receipts at the smelters, including concentrates, were, for the week, 38,787 tons, and for the year to date 1,714,213 tons.

BOUNTIES.

The following were the concerns participating in the bounties paid by the Dominion Government on iron and steel during the fiscal year ended March 31st last:

Algoma Steel Company	$ 318,814
Dominion Iron and Steel	1,029,503
Nova Scotia Steel	97,345
Hamilton Steel and Iron	238,408
Lake Superior Iron and Steel	54,628
Ontario Iron and Steel	4,463
Canada Iron Corporation	41,146
Atikokan Iron Company	15,099
Standard Chemical Company	10,120
Total bounties paid	$1,808,533

SHARE MARKET.

Platinum, ordinary, $39.50 per ounce.
Platinum, hard, $41.50 per ounce.
Bismuth, $1.95 per lb.
Quicksilver, $43.50 per 75-lb. flask.

TEMISKAMING AND HUDSON BAY.

The directors of the Temiskaming & Hudson Bay Mining Company, of Cobalt, have declared another dividend of 300 per cent. on the capital stock to be paid on Saturday, November 12, 1910.

This is the 28th dividend declared by this company, and the seventh this year as follows:—

	P.C.	
January 11	300	$23,263
February 17	300	23,263
April 12	300	23,263
May 25	300	23,263
July 29	300	23,263
August 29	300	23,263
November 12	300	23,263
	2,100	$162,841

Thus making 2,100 per cent. paid this year, and a total of 17,200 per cent. since the company started paying dividends.

The capital stock of the company issued is $7,746, so that a 300 per cent. dividend means a distribution of $23,263 amongst the shareholders.

With its dividend just declared the company will have paid $1,319,335, or $172 on every $1 share.

TEMISKAMING STATEMENT.

The following financial statement, covering the operations of the Temiskaming Mine for the nine months ending October 31, 1910, will accompany the dividend cheques, which will be mailed to shareholders in the course of a day or two:

Assets.

Capital assets	$2,640,624.51
Cash in Union Bank	171,811.26
Ore at smelters	241,340.77
Ore on hand	56,049.00
Petty cash	18.23
Open accounts due company	6,956.00
Supplies on hand	8,901.44
Treasury stock	829.00
	$3,126,530.30

Liabilities.

Ottawa Bank	$ 3,707.40
Open accounts payable	544.87
Wages payable October	10,610.05
Capital stock	2,500,000.00
Revenue account (surplus):	
Balance brought down	14,303.68
Profit for nine months	579,364.30
	$3,126,530.30

For the last quarter the profits of the Temiskaming Company were $284,762.93, or at the rate of $94,920.98 per month.

ON TIME

One of the most important business transactions which sensible minded men should perform on time is that of making proper provision for those who are dependent on them for the necessities of life.

The only way to do this is by means of life insurance. The only way to do it on time is to act now while in health. The most satisfactory way is to insure at once in the

Mine Management

Our organization offers many advantages to investors and mine owners seeking competent management. Under our scheme of management a continuity of policy is assured regardless of changes in the local staff. We are willing that our compensation depend upon results obtained. We know that our methods mean low working costs and maximum profits. Let us make you a proposition.

TORONTO.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price,

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE FOLLOWING GEOLOGICAL MAPS HAVE BEEN RECENTLY ISSUED:—

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1025. Waverley Sheet. Scale 1 mile to 1 inch.
1037. Windsor Sheet. Scale 1 mile to 1 inch.

QUEBEC

1079. Geological and Topographical Map of St. Bruno Mountain, Chambly Co., Que. Scale 800 ft. to 1 inch.

ONTARIO

1076. Gowganda Mining Division. Scale 1 mile to 1 inch.
1061. Explored routes in a portion of North Western Ontario, traversed by the National Transcontinental railway between Lake Minnitaki and Lake of the Woods. Scale 4 miles to 1 inch.

ALBERTA

1032. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.

BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland. Scale 400 feet to 1 inch.
1004. Geological Sheet, Rossland Mining District. Scale 1200 feet to 1 inch.
1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1105. Map No. 4A. Geological—Golden Zone Mining Camp near Hedley, B.C., by C. Camsell. Scale 600 feet to 1 inch.
1106. Map No. 3A, Geological—Mining Claims on Henry Creek near Hedley, B.C., by C. Camsell. Scale 800 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1041. Geological Map Whitehorse Copper Belt. Scale 1 mile to 1 inch. Also several detail maps of the ore bodies of the same belt.
1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.
973. Catalogue of Canadian Birds, by John Macoun and James M. Macoun.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotland Part I, Economics, Part II Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

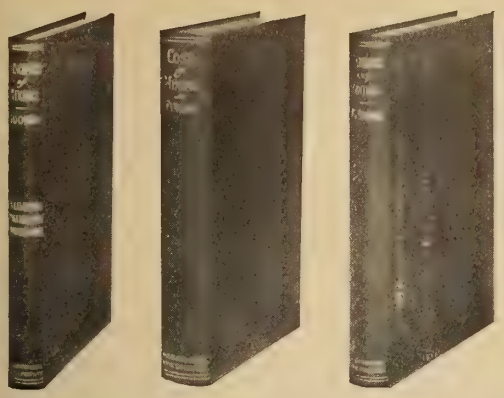
ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon and Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
980. Report on a portion of Algoma and Thunder Bay Districts, by W. J. Wilson, and on the region lying north of Lake Superior between the Pie and the Nipigon Rivers, by W. H. Collins. A map showing the geology along the water courses from Lake Superior to the Albany River and from Missinabi to Nipigon River accompanies the report.
1082. Memoir No. 6. Geology of the Haliburton and Bancroft Areas, Ontario, by Frank D. Adams and Alfred E. Barlow.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.

YUKON and NORTH WEST TERRITORIES



1050. Whitehorse Copper Belt, accompanied by maps, by R. G. McConnell.
1097. A Reconnaissance across the McKenzie Mountains on the Pelly, Ross and Gravel Rivers, Yukon and North West Territories, with map, by Joseph Keele.

NEW CATALOGUE

1073. Catalogue of Publication 1843—1909.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Goverment of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unserveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minium being 40 acres in unserveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

MINING AND SCIENTIFIC PRESS

Controlled by T. A. RICKARD — Established 1860 — Published weekly at San Francisco, Cal.

In every issue valuable articles are published on mining, metallurgy, and geology, the latest news from special correspondents at the principal mining centers, letters giving the ideas and experience of successful men, and other items of useful knowledge.

THE MINING MAGAZINE

Established September, 1909

T. A. RICKARD, Editor — Published monthly at London, England

A monthly magazine is the natural corollary of a technical weekly. It permits of more deliberate and more extended notice of matters concerning which the news element is less important.

The Mining Magazine includes a review of the world's progress in mining, metallurgy, and economic geology, written by men who have personal knowledge of the regions and conditions discussed.

Prospecting, Locating and Valuing Mines

By R. H. Stretch, E. M.

Not only prospectors but all investors in mining properties should own this book. It is a safe guide and an invaluable reference work. It is the *standard*. Ten thousand copies have been sold. It is full of facts and data. It tells you all about

Mines—and mistakes in mining.
Mineral Deposits and Veins and how to detect them.
Locations and Patents.
Preliminary Development of Mines.
Discussions of Various Minerals.
Useful Tables and Diagrams.

Cloth, Library edition, $2.00 net, postpaid
Leather, pocket size, $2.50 " "

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

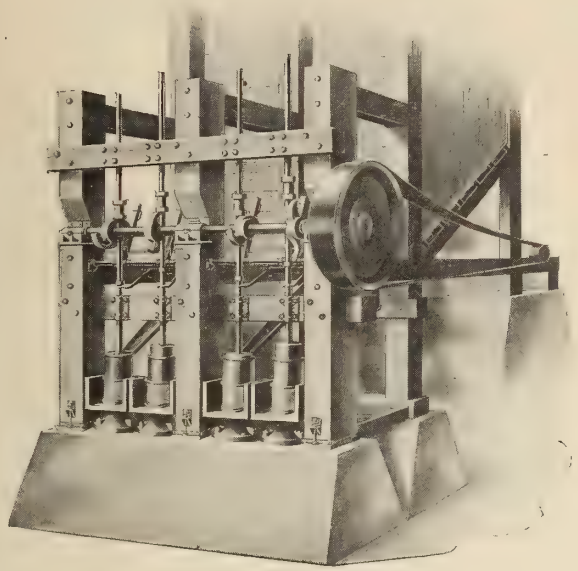
NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE



Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines

The Nissen Stamp Mill

Nissen Stamp Mill

STAMP. The Nissen Stamp drops with great crushing effect upon a feed comparatively free of the fines caused by preceding impacts. This causes a a tural splash which radiates from the centre of the die, carrying the pulp to a circular screen, every aperture in which presents a full opening for the pulp which has already reached size to pass through. As the stamp ascends preparatory for the succeeding blow, a partial vacuum is formed under the stamp shoe, which greatly assists the rapid return of the oversize to the die. This condition, the circular form of mortar, and the ascending stamp, lead to a suction effect which hastens the return of oversize to the die, a feature distinctive to the Nissen Stamp. Thus, a greater number of effective drops per minute is possible, resulting in greater capacity.

FEEDER. Each Nissen Stamp is provided with a tappet driven, automatic ore feeder of the Challenge type. This feeder is easily adjusted for different rates of feed, and is very sensitive in responding to the action of the stamp.

MORTAR. The Nissen Mortar is circular in plan and made to accommodate but one stamp, thus confining the crushing zone to a field of activity which forbids pulp coming to rest or becoming sluggish in that circulatory movement essential to efficiency.

The screen of the Nissen Mortar is circular and extends more than half way around the mortar, forming an area of discharge for one Nissen Stamp equal to about two-thirds that employed for five stamps of the old type.

L. 31 TORONTO No. 24

THE

"Hardy Simplex" Hammer Drill

Extremely Simple and Durable. Will give splendid results on low air pressure.

In speed is equal to any ordinary 3in. piston drill.

It is not a converted chipping hammer, but a rock drill of great power and high economy.

The drill steel is turned automatically by means of a very carefully designed special rotation device, upon which the great success of the machine is founded to no inconsiderable extent.

This is a feature which is not found in other drills.

Let us send you a fully illustrated and descriptive Catalogue.

"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just becanse it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be the stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we know, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs per year than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line, As you have everything to gain and nothing to lose, why not investigate NOW?

BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

Why the C.P.R. North Toronto Route to Ottawa and Montreal is the Logical One

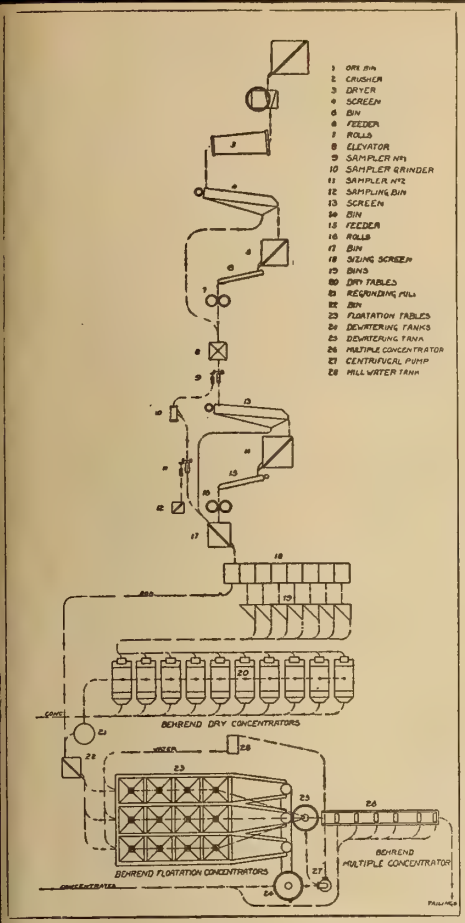
The train leaves as follows:

Leave North Parkdale - - -	9.15 p.m.	Leave West Toronto - - - -	9.30 p.m.
Arrive North Toronto - - -	9.40 p.m.	Leave North Toronto - - -	10.00 p.m.
Arrive Ottawa, 6.50 a.m.		Arrive Montreal, 7.00 a.m.	

Daily except Sunday.

¶ The residents of Toronto are adjacent to either North Parkdale, West Toronto or North Toronto stations, same being easily accessible and closer to residential districts.

¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.



¶ The roadbed has been improved till it is unexcelled in Canada. Practically half the line is double tracked.

¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, non-obsequious, ensure efficient service.

Geology Applied to Mining

By Josiah Edward Spurr, A.M.

Mining men, prospectors, investors and students have found this book a treasure house. It is a plain, simple, straightforward application of economic geology to mining problems. It is a concise summary of the principles of ore deposits for the man who wishes to exploit them. It isn't *geology*, but *geology* as *applied to practical mining*. It boils down the abstract science for the practical mining man and student—the processes of deposits, the arrangement of stratified rocks, igneous rocks, structures, placers, chemical geology, etc., etc.

Library edition, cloth, $1.50 net, postpaid

PRESIDENT ELIOT ON EDUCATION.

Not many years ago the equipment of the best of our Canadian mining schools consisted essentially of "a blackboard and a piece of chalk." There are men still in the prime of life who were pioneers in other branches of applied science in this country. If we consider Canadian history to have begun at the time of the American revolution of 1776, when the people of the northern half of the continent became distinct politically from those of the southern, it took over a hundred years for our people to learn that the old educational system of Europe was not adapted to the needs of a young country. For nearly a century our system of higher education at least was based on that of the old world. Attention was given merely to book-learning, which resulted chiefly in memory training. It is true that the sciences were taught in our universities, but the methods of instruction were similar to those employed in the classics. Practical work was not encouraged. For instance, in 1853, when the late Dr. Chapman began his work as Professor of Mineralogy and Geology in the University of Toronto, his request for laboratory facilities met with refusal from the board of trustees. He was told that practical work was out of place in a university and that he was to teach by book methods.

However, during the latter part of the century referred to, changes of view in methods of education were taking place abroad. Herbert Spencer's "Education" was published in 1860. "It is a vindication of the study of nature and the rightful supremacy of science in education. It proves that the latest and most highly evolved form of knowledge is the best, both for guidance of life and for the discipline of the mental powers." This book had a profound influence. It crystallized the more or less hazy ideas that had begun to be held by certain educationists and others. The controversy is still waged, but much more mildly, as to the comparative merits of the so-called "cultural" studies and science or utilitarian subjects.

Mining engineering can scarcely be said to be classed as a profession in Britain. It is considered *infra dig* for sons of "society people" to take up the study of mining or metallurgy, although Britain owes her standing among the nations as much, if not more, to her engineers and men of science as to any other class. Mining engineering there is classed as a trade and its members as mechanics. It is considered quite proper, however, for a man of the highest social position to occupy the post of dummy director on the board of a mining company.

At the present time the Dominion Government's Royal Commission on Technical Education is holding sessions in various parts of the country. For this reason and owing to the fact that false views concerning the

difference between cultural and practical studies still exert baneful influences, although small compared with formerly. President Eliot's recent address in the University of Toronto "On the Development of the American University during the Last Sixty Years" was timely and of great value.

Dr. Eliot became a student of Harvard College in 1849, when the studies were all "cultural," the only faculty trained being the memory. Since then all his time has been spent in college work. He was president of Harvard, the greatest and oldest of American universities, from 1869 to 1909, when he retired as president-emeritus. His long experience as president and teacher in Boston, "the centre of culture," and his acknowledged high standing, not only as an educationist but as one of the most eminent of Americans, give great weight to his opinions on educational problems in general and especially to his views on the relative cultural values of the various subjects of study.

Parts, at least, of Dr. Eliot's address must have come as a great shock to the sticklers for "cultural" as opposed to utilitarian studies. They must have rubbed their eyes and asked themselves, "Can this be a Harvard man and a Bostonian?" Let us give Dr. Eliot's own words concerning cultural studies: "I think we should have everything taught by utilitarian examples. It has too long been believed that nothing which is useful can be cultural. I would reverse the maxim and say that nothing can be cultural—in a democracy at any rate—which is not useful. Many believe that culture must come from books; that the usefulness of a thing is to its positive detriment; that the fact that it can be applied shows that it is inappropriate material for educative purposes. I believe these views to be fallacious."

Even after the views of Spencer, Eliot and others of the same school of thought have been widely accepted, there have been great practical difficulties in getting the teaching of utilitarian subjects on a proper basis. Classics and other subjects of the memory-training kind have been taught for centuries. Methods of teaching these subjects have been perfected, while the teachers of science or utilitarian subjects have had little experience to draw upon and have employed cruder or more imperfect methods. Naturally when the purely book subjects were better taught in the schools, preparing pupils for entrance to technical institutions or universities, than were the sciences, the latter subjects would attract few of the best pupils. They naturally take up the subjects of study taught by the best teachers. Until within a very few years courses in science or technology have not attracted a fair percentage of students of first rate ability. Science is only now coming into its own. The best students instead of following the older courses of study are entering the science courses in increasing numbers. A good instance of this is found in the case of the University of Toronto. This university has an entrance class in Arts of about four hundred annually. The Prince of Wales prize, for general proficiency in the subjects of the entrance examination, is competed for each year. Many of the winners of this prize during recent years have chosen a course in science when beginning their university work.

When we consider the vast improvement that has taken place since the study of utilitarian subjects has been taken up in earnest—improvement, we believe, not only in the physical well-being of man, but also in his mental and moral condition—we must join with President Eliot in his optimistic hopes: "Looking forward to the future, and we all like to look forward, I find in the modern development of our universities my chief grounds for hope that democracy means the good of the commonwealth, and that it will ultimately lead the way to the final goal of civilization, the greatest happiness for the greatest possible number."

A EUROPEAN VIEW OF PORCUPINE.

The opinions of disinterested visitors are usually of value. Dr. A. L. Simon, well known in the world of mining, spent some time this year in Porcupine. To the November number of The Mining Magazine (London, Eng.), he contributes a general article embodying a description of the summer trail, and his own impressions as to the district. That trail is now practically a thing of the past. The winter road is now in full commission, and a government railway is assured for next summer. Hence this part of Dr. Simon's article is already out of date. Incidentally, also, we can assure Dr. Simon that he need not have expressed doubt as to the special privileges that attach to veteran claims.

Dr. Simon suggests that the absence of a road and of a telegraph line, point to a lack of confidence on the part of the Government of Ontario. We cannot see that the Ontario Government is called upon to display confidence in Porcupine. The Government has recognized a moral obligation in consenting to construct a railway. But the Government is doing this because it desires to help the bona fide operator; it is not animated by a wish to create a boom. It would be distinctly unfair to make capital out of a generous concession to the needs of a mining camp. In so far, however, as the railway will facilitate and cheapen transportation, Porcupine has been given a helping hand at the proper moment.

Dr. Simon, in commenting upon the ore bodies, alludes to the almost complete absence of an appreciable oxidized zone, and to the fact that the country rock exhibits decomposition neither on the walls of the veins nor on the surface. He comments specifically upon two or three well-known properties.

But the most interesting part of his article is the concluding paragraph, in which he holds up to scorn the prices asked for Porcupine properties. After alluding to the rumour that for one property a price of about $7,500,000 was asked, Dr. Simon proceeds as follows: "These figures are mentioned to emphasize the utter hopelessness of doing any serious business as far as slightly developed property is concerned; but the terms

asked for properties where merely a quartz vein in to be seen or even where nothing has been proved as yet, are similarly unapproachable. The prices asked for claims vary from about $15,000 to $350,000. . . . No owner can explain why he asks $15,000 and not any other sum. The whole idea of purchase at the present time is regarded as a lottery game."

Whilst these strictures are, in the main, just, they are a trifle too sweeping. Owners of Porcupine claims are not lacking who are willing to dispose of their properties on reasonable terms. It is quite true that unreasonable prices and terms are asked for most of the properties. But we frankly believe that the purchaser is more to blame than the vendor. So long as there are people foolish enough to pay disproportionately large prices for undeveloped mining claims, there will be little difficulty in finding persons willing to receive their money.

Dr. Simon's parting fling at the operators who have installed small mills is unjust. He implies clearly that these mills have been erected solely for the purpose of playing the stock-market game. We cannot see that Dr. Simon or any other casual visitor to Porcupine is qualified to pronounce upon the motives actuating the operators in question. And in any case it would have been more in accordance with fair play had Dr. Simon made a direct accusation.

DEVELOPMENTS IN NOVA SCOTIA.

By far the most significant news that has reached us lately from the east is the announcement that the Dominion Steel and Coal Corporation has taken over the Springhill collieries of the Cumberland Coal and Railway Company.

Since both companies have been parties to several previous transactions, this event is hardly a surprise. It is, however, an occurrence that will influence strongly the development of coal mining in Nova Scotia.

Under the old regime the Springhill collieries suffered many vicissitudes. They never could and, apparently, they never would have been brought up to the point of maximum production. It were invidious to allocate the blame for this state of affairs. But facts cannot be blinked. Springhill has lost continuously and enormously through the lack of sympathy between operators and employees.

Trouble has arisen from the refusal of the previous management to deal with the U. M. W. A., and there is little room for disputing the justice of that refusal. We hope and believe that the new owners will live up to their announced policy of ignoring that unwholesome society. But we may also express the hope that many local causes of friction will disappear with the advent of a new management. Mutual concessions there will have to be, and it is but reasonable to suppose that both parties will be only too eager to establish a modus vivendi.

The Springhill collieries produce about 350,000 tons of coal per annum. The coal is somewhat high in sulphur, but much of the run-of-mine is lower in ash than the other mainland coals of Nova Scotia, and makes a bright clean coke. The collieries are situated in such a way that they can command a large share of the maritime market and can also compete successfully for a substantial proportion of the Intercolonial Railway contracts. In addition they can make a strong bid to supply the demand in the most northerly sections of the New England States.

Considered in all material aspects, the change of ownership will be beneficial. It should certainly mean better times for Springhill and ampler opportunity for the Glace Bay collieries to exploit the St. Lawrence. Not less important will be the probable expulsion of the U.M.W.A. from its greatest stronghold.

We would not for a moment imply that the new owners of the Cumberland Railway and Coal Company have been seriously influenced by a desire to take a fall out of the U.M.W.A. But we believe that the latter organization cannot and will not survive.

In our news columns will be found the particulars of price paid, etc. These need not be repeated here. All that it is necessary to add is that we consider this last move an indication of a sound and courageous policy.

ENGLISH RAILWAY COAL BILLS.

It is with genuine surprise that we note in English exchanges the fact that the Miners' Eight Hour Act has not augmented the price paid for coal by the principal English railways during the past year. Following are the total expenditures for fourteen large companies:

Year.	Total amount paid for fuel by 14 leading railways.
1903	£4,959,000
1904	4,874,000
1905	4,810,000
1906	5,048,000
1907	6,175,000
1908	6,540,000
1909	5,550,000

The total expenditure by eleven of the largest during the latter half of 1909 was £2,478,000; and for the former half of 1910 the figures are £2,434,000

To determine the factors that had induced this reduction, or that have at least prevented an increase, is not practicable. But it is most gratifying to note that at present there is no sign of prices being enhanced. It appears, also, that new contracts are being placed at favourable figures.

PORCUPINE AND PAPERS.

We wish to felicitate our friend the Toronto Globe upon the constructively sane tone of its remarks concerning Porcupine. It is truly edifying to notice the improvement, not only in the Globe, but in not a few other daily papers.

In discussing new camps like Porcupine it is hard to observe the strict line of common sense. Anything savouring of destructive, or even of instructive, criticism is likely to be resented. Hyperbole is popular; but, in the long run, it is terribly costly. Thus it is with unfeigned appreciation that we read the sincere efforts of our daily contemporaries to warn their readers off the shoals of hysterical speculation.

When, however, a public journal undertakes to advise and to guide and to criticize, the dictates not only of good sense but also of the moral law demand that that journal keep its own skirts clean. Applying this dictum to the case at hand, it is apparent that the paper that warns the public against the blandishments of Porcupine promoters must of necessity refrain from selling its advertising space to mongers of dubious shares. So far as we have observed, our daily journals have not yet erred wittingly—at least as regards Porcupine. They appear to have grasped the fact that they must practice what they preach. Incidentally they may have learned by experience that honesty is the best policy.

A RAILWAY TO PORCUPINE.

Tuesday, November 29, was an eventful day for Northern Ontario. On that day Sir James Whitney announced that the Provincial Government would immediately undertake the construction of a branch of the Temiskaming & Northern Ontario Railway from a point on the main line near Kelso to Porcupine. The distance to be covered is about 31 miles, and the estimated cost of construction is less than $500,000. It is probable that the road will be ready to operate early next autumn.

All those who are struggling to develop claims in Porcupine will be thoroughly grateful to the Ontario Government. The work of mining will be greatly facilitated, and Porcupine will be given a chance to prove itself without costly delays.

But the success of the new railway will not wholly depend upon Porcupine. The farmer is following hard upon the heels of the prospector. A considerable proportion of the territory tapped by the T. & N. O. is admirably suited to agriculture. This fact will certainly influence favourably the future position of the whole line.

The action of the Ontario Government is wholly commendable.

NEWSPAPER COMMENT.

A curious change has come over Canadian newspapers since the early days of Cobalt and Larder Lake. The lessons taught by experience deter self-respecting papers from accepting inspired "mush." Also, the intelligently critical attitude of such papers as the Telegram, News, Star, and Globe, of Toronto, and the Star and the Herald, of Montreal, is distinctly profitable. But one outstanding exemplar of caution and common sense is the Cobalt Nugget. The surroundings of the last named paper must be peculiarly difficult. It is in the very centre of the maelstrom. Up to the present it has refused to soil its pages with unseemly advertisements. Long may it and its larger contemporaries refuse to bow the knee to Baal.

EDITORIAL NOTES.

The declaration of a one per cent. dividend on Granby, though disappointing in size, is in itself encouraging. There seems to have been undue alarm as to the physical condition of the company's mines.

The Cobalt Provincial mine has made its first shipment. Long may they continue.

BOOK REVIEWS.

TESTING FOR METALLURGICAL PROCESSES—BY JAMES A. BARR, B.S., M.E.—200 PAGES—PRICE, $2 POSTPAID—PUBLISHED BY THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, AND THE MINING MAGAZINE, LONDON, 1910.

The problem of hitting upon the right process for any given ore can be partly or wholly solved in the laboratory. Mr. Barr seeks to guide the investigator into the shortest and best paths. Laboratory tests to determine the suitability of ores to amalgamation, chlorination, or cyanidation are outlined. Zinc, copper, silver ores are also included. Concentration tests, furnace tests, the examination of slags, are among the numerous subjects presented. The concluding section, giving data as to the cost of the various kinds of ore treatment, lends added value to the book. Necessarily the book is written for persons who already are acquainted with the principles of chemistry and of metallurgy.

MILL COSTS.

In Mr. J. A. Barr's new book, Testing for Metallurgical Processes," published by the Mining and Scientific Press, some very interesting cost data are given. For instance, in Californian stamp-mills, 10 to 40 stamps, the cost of amalgamation and concentration, is put at from 40 to 50 cents per ton. In Black Hills mills the same figures are given for mills of 200 stamps. Cyanidation costs from 85 cents to $2 per ton, in plants of from 100 to 200 tons capacity. The corresponding costs for chlorination (barrel process) are from $3.50 to $5 per ton.

PRACTICAL STAMP MILLING AND AMALGAMATION — BY H. W. MacFARREN—166 PAGES — INDEXED—ILLUSTRATED—$2 POSTPAID—MINING AND SCIENTIFIC PRESS—667, HOWARD STREET, SAN FRANCISCO, AND THE MINING MAGAZINE, 819, SALISURY HOUSE, E.C. LONDON, ENG. 1910.

A book that "goes straight to the details of the practical work" of stamp milling has long been a desideratum. The "how" and the "why" of stamp milling have never received fair treatment. "Practical Stamp Milling and Amalgamation" is a good beginning. In this book of 166 pages an attempt, a very fair attempt, is made to outline the practice and the philosophy of the stamp mill.

All practical and professional work is a function of applied common sense and experience. Sometimes the theorist has too much to say; and sometimes the empiricist has sway. But neither is the man who makes precedent. The stamp mill, probably more than any other human contrivance, has suffered from both. Nevertheless, to-day modern stamp milling is the conjoint product of the practical worker and of the theorist. The mill man, content with fairly good extraction, is not apt to change either the sequence of his stamps or any of the numerous items that go to make up the art of stamp milling. But the theorist is always a disturbing factor. Using the experience and disregarding the conservatism of the mill-man, he treads where angels fear to tread. And sometimes he gets results. Also it is this kind of result that, in the aggregate, constitutes progress. However, all this is beside the point, and is inspired solely by the fact that the reviewer has before him a good and a sound book on the use of the stamp-mill.

If the reader can pardon the preliminary discursus, the reviewer will hasten to make amends by indicating the ground covered by Mr. MacFarren's book. And, to proceed forthwith, the book is divided into ten chapters. Chapter No. 1 touches on the location and design of the stamp-mill, and discusses the rock-breaker, grizzly, ore-bin, battery frame and mortar-block. Chapter No. 2 treats of the integral parts of the mill unit, the mortar, die, shoe, bosshead, tappet, and cam. The third chapter treats of the stem, stem breakage, height of drop, order of drop, etc. Chapter four takes up water supply, rate of drop, weight of stamp, height of discharge, and so on. In this chapter a cursory comparison of the individual stamp and the 5-stamp battery is made. The remaining chapters are devoted to mill practice.

"Practical Stamp Milling and Amalgamation" gives evidence of care, experience, and knowledge. It is a good book.

Correspondence

Editor, CANADIAN MINING JOURNAL:

Sir,—The article on gold production in Nova Scotia, in your issue of December 1st, signed by yourself, has brought up a query in my mind. Some years ago my assistance was asked in connection with a gold mining project in Nova Scotia. At that time I knew nothing of the mines of this Province. Enquiry elicited the fact that a report, supposed to have been unfavourable, had been in the hands of the Government for some time. I could not obtain a copy of this report. But the rumour was in itself discouraging, especially as the report was said to have been made at the request of the Nova Scotian Government. Other circumstances conspired to prevent me from taking up the matter. But my curiosity as to the character of the alleged report has not yet been satisfied.

I enclose my card, which, I think, will identify me sufficiently. As I may in the near future undertake to revive one of the old mines, I wish to sign myself, merely,

QUERY.

EDITOR'S NOTE—Six years ago Mr. T. A. Rickard, now editor of the "Mining Magazine," London, England, made a provisional report upon the gold mines of Nova Scotia. This was done at the request of the Provincial Government. Mr. Rickard was selected for the work by the Mining Society of Nova Scotia. As to the tenor of that report nothing has been made officially public. The report was withheld from publication for the reason that it contained severe strictures upon certain operating companies.]

Editor CANADIAN MINING JOURNAL:

Sir,—The letter from Mr. Denis, in your issue of Nov. 15th, can hardly be called a reply to my criticism of his report issued by the Mines Branch on the Manganese Deposits of the Maritime Provinces. It is rather a short dissertation of personal characteristics.

It is true I did apply for an opportunity to write up this subject for the Government and had I the opportunity I certainly would have given the industry a just and fair report, but what this has to do with my observations on Mr. Denis' report is not clear, nor do I understand why he should attempt to cover his deficiencies by such personal allusions.

I have, in the past, operated for commercial purposes a few of the Nova Scotia manganese deposits and have examined and reported upon all the known deposits, except one, in the Maritime Provinces and many other deposits, outside of these provinces. All the information gained in this work, was offered free to Mr. Denis. He evidently had no use for it and the result is the publication of the report, which I repeat "is not only misleading but useless and detrimental to the industry."

Until the Mines Branch can explain how they can form an intelligible opinion of the "Canadian Ores of Manganese," from Mr. Denis' examination and his "unpretentious" notes, I will refrain from further criticism and consider the subject closed.

In conclusion I may say that I am, without "useless unpleasantness and ill-feeling, spite or disappointment," charged against me by Mr. Denis,

Yours, etc.,
W. F. JENNISON.

Truro, Nova Scotia,
Nov. 25th, 1910.

Mechanical and Metallurgical Progress on the Rand

In the Consolidated Mines Selection Company's report reference is made to the mechanical and metallurgical progress made on the Rand during the past year in the following terms: "Most of the notable mechanical improvements effected during the past year have been in connection with the increasing popularity of electric power, now rapidly replacing steam in many departments. Amongst the more notable in mining conditions—apart from the tendency towards better housing and general conveniences for both white and coloured employees—may be mentioned that of artificial ventilation, sand-filling in stopes, and greater efficiency in rock drilling. In the department of ore reduction and treatment many new ideas have been and are now being experimented with. Broadly speaking, the progress of the mining industry grows apace and the outlook continues promising. The Union Government will no doubt follow in the steps of the late Transvaal Government in assisting the mines as regards labour supply to the best of their ability in order to keep the finances of the Union in a healthy condition. It may be mentioned that this company has formed a labour department for the benefit of mines under its control, and that same is in charge of an experienced official."

MINING CASE DISMISSED.

Clifford E. Smith, of Brockville, vs. Dr. Hersey, et al.

In the case of Smith vs. Wyandoh, tried before the Honourable Sir John Alexander Boyd, Chancellor of Ontario, at Toronto, the following statements were made by counsel, as appears from official record:

Mr. Cowan: My Lord, in view of your Lordship's suggestion this morning, I am very glad to say that an adjustment has been made in the whole matter between the parties, satisfactory to all of the parties; and I desire, acting as counsel for the plaintiff, to withdraw from the record any and all charges of wrong-doing or fraud that have been made against any of these defendants. I think, however, it is only fair to the plaintiff to say that your Lordship will remember the dates in which the various transactions occurred, the plaintiff being up north and cut off literally from mail and telegraphic communication, that he became naturally suspicious; probably unkind friends may have urged him on, and he felt when he commenced this action that a state of facts existed which he has since learned did not exist. As the case has progressed, and the examinations for discovery have been had of literally all the parties to the transaction, that suspicion has gradually faded away. I have endeavoured to the best of my ability, as counsel for him, at the risk of trying the patience of your Lordship by travelling outside the record, putting the defendants one after the other in the box, to see whether or not there was anything in the charges spread on the record. I feel in duty bound, as counsel, to say that I am convinced that there is not, and the plaintiff authorizes me to make that statement to the Court and to entirely withdraw in the fullest and freest and frankest way all charges of wrong-doing or fraud against Mr. Brook, Dr. Hersey, and the other defendants in this transaction.

Mr. Shepley: I have only to say, my Lord, that there does not seem to be anything necessary for your Lordship to do, beyond noting that the withdrawal of the charges of fraud has been made in the ample fashion in which my learned friend has made it, and dismissing the action without costs.

His Lordship: The record will be then, charges withdrawn.

Mr. Cowan: Your Lordship may observe, there is a counter-claim made against the plaintiff. I suppose that is dismissed without costs?

Mr. Shepley: Yes.

His Lordship: Action and counter-claim dismissed without costs.

I am very glad a settlement has been arrived at in this case. It seemed to me, during the progress of the inquiry, that investigation was needed on some points, but, as Mr. Cowan has said, that has been cleared up very satisfactorily, and I hope nothing has occurred here which will disturb the business and friendly relationships of the parties in the future in any investigations they may have in that very wealthy region.

That will be the judgment of the Court, withdrawn, without costs.

PORCUPINE AND THE MOTHER LODE.

By Reginald E. Hore, Houghton, Mich.

In the November 26th number of the Mining and Scientific Press the editor comments on an article which appeared in this journal on November 1st, and calls attention to some interesting points of similarity between the Porcupine deposits described by the writer, and the Mother Lode of California. This editorial may prove of interest to readers of the Journal, and as there is in the case of the carbonate rocks even greater similarity than Mr. Bain supposes I add a few remarks concerning their composition:

"Judging from the description by Mr. Hore, the veins of Porcupine greatly resemble the Mother Lode of California, particularly those in Mariposa, Luohumne, Southern Calaveras County, in central Amador County near Jackson, and also at and near Placerville, El Dorado County. In these several localities there are huge masses of the carbonate of lime, magnesia, and iron, commonly known as ankerite, which are seamed with large and small veins of quartz, in much the same manner as that described at Porcupine. In California these great masses of ankerite, some of which are over 300 feet wide, are usually accompanied by an abundance of the green micaceous mineral, mariposite. No mention of mariposite, or any mineral answering its description, is made by Mr. Hore. However, mariposite is sometimes absent in the California ankerite masses. Generally, the ankerite of the Mother Lode is auriferous, though not to a profitable extent. That in Rawhide mine in Tuolmene County, was an exception, some of it being extremely rich in gold."

In view of Mr. Bain's remarks it may be interesting to note that one of the most characteristic minerals of the ferrodolomite at Porcupine, and also at Larder Lake, is a green micaceous mineral similar to mariposite. The mineral is usually present in very small and irregular particles so that it cannot be readily studied optically nor cleanly separated for chemical analysis. The mineral is present in nearly all the darker coloured masses of carbonates and, along with black iron oxides, is the cause of the colour. There are quartz veins in Porcupine which cut through such dark micaceous ferrodolomites, but those deposits described by the writer happen to be in lighter coloured masses which are chiefly carbonates and quartz. A few feet north of the Connell vein, for instance, the carbonate is quite dark in colour with much green mica (mariposite?) and black iron ores. There are a number of masses of similar rock in which the carbonate becomes a minor constituent. Crystals of the latter are larger than the dark particles and give the rock a porphyritic appearance. The carbonate is, however, easily recognized, as it is readily scratched with a knife and effervesces with dilute acid.

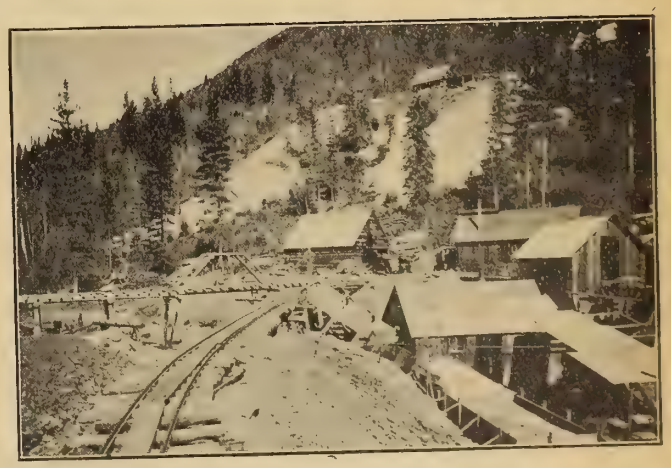
VALE ALASKA-YUKON-PACIFIC EXPOSITION.

Announcement has been made publicly that practically 90 per cent. of the dividend to be declared shortly by those who are winding up the affairs of the Alaska-Yukon-Pacific Exposition, so successfully held at Seattle, Washington, U.S.A., last year, will be applied in support of the local tuberculosis hospital. The greater number of the stockholders have already assigned to the hospital their share in the forthcoming dividend, and many others are expected to do likewise. Approximately $22,000 of the promised subscriptions is still unpaid, but payment of $3,750 of this amount will soon be made. Until after the settlement of pending litigation, the amount that will be available for disbursement as a dividend can not be definitely ascertained. It is claimed that the percentage of collections made in connection with the A. Y. P. Exposition is greater than that made for any other world's fair yet held.

The site of the A. Y. P. Exposition, on the campus of the University of Washington, has been cleared, and the university authorities are again in possession of it. The value of new buildings acquired by the university, and of improvements made to the grounds, is estimated at approximately $500,000, so the university has benefitted substantially as a result of the holding of the exposition on its lands.

THE STANDARD MINE, SLOCAN DISTRICT, BRITISH COLUMBIA

BY E. JACOBS, Victoria, B.C.



What is probably one of the largest showings of silver-lead ore of good grade yet seen in British Columbia has been opened in the Standard mine, near Silverton, Slocan Lake. It is in the part of the mine opened by No. 5 adit. When I was in the mine last June I saw two drift faces each having four to five feet of solid galena, with fahlerz carrying high value in silver. One vein was 30 feet wide, with four feet of shipping ore, and the remainder mostly concentrating ore containing silver-lead and zinc in quartz. Since then the greater part of the vein has at times been ore of good grade. A photograph taken a few weeks ago showed a face of 20.5 feet of ore, besides which there was two feet of ore on the hanging wall, separated from the big ore body by six feet of poor material which does not show in the photograph.

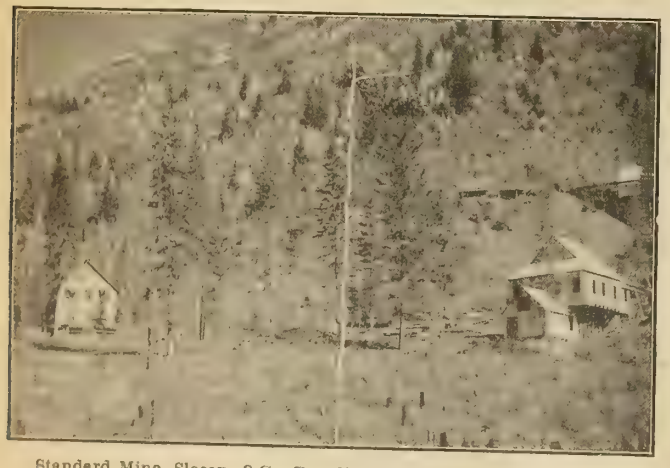
Standard Mine, Slocan, B C.

Part of Surface Works at Standard Mine, Slocan, B.C.

Standard Mine, Slocan, B.C.

The Standard Group.

The Standard group was described by Mr. Robert R. Hedley, in the Report of the Mining and Metallurgical Industries of Canada, issued by the Mines Branch of the Canada Department of Mines, as follows:



" This property is owned by G. H. Aylard and John A. Finch, and is situated above Four-Mile Creek, at an altitude of 3,700 feet, in the Slocan mining division. Its development is under the direction of G. H. Aylard, of New Denver. The property comprises the Shuniah, Standard, and Surprise, Crown-granted mineral claims, of 130 acres. The occurrence is a typical series of

Standard Mine, Slocan, Face of No. 5 Adit—shows 20 ft. 6 in. of ore, beside which there is 8 ft. of the Vein not shown in the photograph. This vein is 30 ft wide in places.

lenses, in Slocan slates, with the usual mineralization, galena being most in evidence. It makes an exceptionally clean sorted ore, carrying 60 per cent. lead, and 80 oz. silver per ton. The several upper levels have been worked out, No. 4 being now (December, 1907) the only producing level. This level has developed a very fine shoot of excellent ore, which, however, has not yet been extensively stoped. Two tunnels, at lower levels, are being driven to cut this shoot. The practice is to roughly sort for shipment, and to accumulate the second grade ore, with a view to its subsequent treatment by concentrating. It is hoped that the development of the mine will ere long warrant the erection of a concentrator. There is meanwhile on the dump probably 5,000 tons of second-class ore, which will carry 12 per cent. lead, 10 per cent. zinc, and 20 oz. of silver per ton. Shipments during 1907 aggregated 700 tons."

Development and production have been continued ever since Mr. Hedley obtained the foregoing information. In 1908 the quantity of ore shipped was rather more than 1,200 tons. The record for 1909 was that 2,100 feet of development work was done and nearly 3,000 tons of ore mined, of which 600 tons of sorted ore was sent to the smeltery and the remainder placed on the second-class ore dump. This year's output of first-class ore will be between 1,500 and 1,600 tons, for more than 1,300 tons had been received from the Standard at the Trail smeltery before the close of November. Meanwhile the quantity of concentrating ore awaiting the provision of milling facilities has been largely increased.

Standard Mine, Slocan, B.C. Boarding House, New Ore-sorting House and Dump of Second-class ore

Development work done in 1910 had, by the end of November, exceeded 1,000 feet, to which that done in December must be added. This work was done on levels 5 and 6, and on an intermediate level between 5 and 4. During the greater part of the year No. 5 has been in good ore, and it still is, as shown in the photograph. Practically all the ore shipped since last June has come from this level, the face of which is now about 1,200 feet from the portal of the adit. No. 6 started lower down the hill, is in 1,500 feet, but it has not yet reached the ore shoot which has been so productive in Nos. 4 and 5. It is estimated that by the end of 1910 the face of this adit will still be 150 to 200 feet from where it is expected the ore will be reached.

Alpha and Emily Edith Mines.

Above the Standard group, higher up the same mountain, is the Alpha group, from which ore rich in silver was taken years ago. Below the Standard is the Emily Edith group extending down to Four-Mile Creek. The Emily Edith mine was worked for some time by an English company, which spent much money on it, but eventually stopped work on account of there being so much zinc in the ore. Messrs Aylard and Finch now own the Emily Edith group, too, but they have not yet done much work on it, the Standard requiring their attention for the time being. It is thought that by extending the Emily Edith adits con-

Standard Mine, Slocan, B.C. New Ore-Sorting House and part of mine ore

siderably farther into the mountain, the shoots of silver-lead ore opened on the Standard will be found to continue down into the much deeper ground of the Emily Edith. This, however, can only be proved by doing a lot of development work, the desirability or otherwise of undertaking which will, in large measure, be determined by the results obtained from driving No. 6 level on the Standard.

The Standard an Object Lesson.

The Standard mine affords an object lesson to those who lack faith in the Slocan district. It was long neglected and considered of little value, but after Messrs. Aylard and Finch acquired it they pursued a policy of steady development over several years, with results of a most gratifying character. There are doubtless other properties in the Slocan district that could be made productive if extensive development was first done. Deep-level development has already given a fresh lease of life to several Slocan mines, and it is well within the bounds of reasonable probability that others would eventually become profitable enterprises if deep development on a comparatively large scale were done on them.

Mr. Aylard continues as manager of the Standard group, with Mr. John Vallance as superintendent of the mine. The latter has been mining in the Slocan district for about 15 years, so his practical experience has been of much service in the development of the Standard.

MINING AND THE INDUSTRIAL EVOLUTION

(Written for the CANADIAN MINING JOURNAL by R. B. Lamb.)*

THE PAST.

Mining in a crude way was, without doubt, carried on in pre-historic times. Even in the age of barbarism it is probably true that the crudest methods were employed to make use of various metals which were found in conditions easily rendered fit for the modest demands of the early peoples.

It is improbable that there was much, if any, improvement in methods during the patriarchal age. In feudal times the industry assumed larger and more definite proportions through the employment of chattel labour.

In the age immediately preceding the industrial or machinery age, or that period known as the beginning of the age of capitalism, we observe a steady growth in the industry. Beginning with the use of steam, we have organic development in all industries, and mining benefitted as abundantly as any other occupation.

In Mexico, among other countries, there remain splendid evidences of the character of work done from one hundred to four hundred years ago. This work was conducted on an extensive scale over long periods, almost entirely without machinery of any kind. The only requisites were an ore body, the ownership of that ore body, and plenty of labour. This labour was slave labour, and the mines were profitable according to the grade of the ore and the amount of labour used under the direction of the miner: so that practically the cost of ore extraction was the amount that would feed, clothe and shelter those employed during the period of extraction, and also maintain them in a state of maximum work efficiency.

"Bocas minas," or stairways, were used for entry and exit. Wooden horse whims were employed for hoisting purposes and for removing water. In later times, iron rods with steel tipped bits were used for drilling purposes. With unrivalled patience these old-time miners persistently followed their ore shoot, often working ores low in metal contents. Reduction plants consisted almost entirely of washing processes, ancient patio process methods, and small crude smelteries.

However, a description of ancient mining, treatment, and equipment methods, is quite unnecessary for the purpose that is in hand. We are hardly concerned with the mining industry earlier than a century ago.

It is the aim of this article to trace in a general way the influence of machinery on the industry of mining, and to enquire into what the industrial age means to the calling in which we are engaged.

Communities, both ancient and modern, have been forced to rely upon the products of the mines for their advancement; and it might with truth be said even for their existence. Mining is the basic industry of our modern world. It is the pioneer work of a vast and complicated industrial system. The miner is the herald of the newer and the coming civilizations.

The histories of the United States, of Australia, and of Africa disclose a rapidity of development (under conditions unparalleled in the world before) which has been brought about by the pioneering spirit of the mining and mineral industry.

It is not overstating the case to say that California would still be a plodding agricultural district imperfectly acquainted with eastern thought had she not been afflicted with a golden fever.

Tasmania and Australia were declared to be much too profitable for convict settlements by their miner pioneers, and the invitation was extended even unto the outcasts of society to abandon their ways, forget their sentences, and search for gold. The digging days of California and Australia marked the birth of a vast, extensive, and permanent mining industry; an industry not confined to gold alone but spreading itself and including all nature's valuable metals and minerals. We find, in fact, within recent times that the systematic search for metals and minerals has taken place in all countries under all conditions of climatic disadvantages, despite untold discouragements and fearful hardships.

THE PRESENT.

It is our theme to enquire into the causes of this unprecedented activity: this unusual demand for the products and the by-products of the mines; to find out why production has become so enormous; why it will be still greater in the immediate future; and to indicate the revolutionary changes that are rapidly taking place throughout the mining world.

The age in which we live is educational and evolutionary. It is marked by great industrial activities in all branches of human endeavour; and these activities are being daily increased and multiplied. It is only by the use of motor power applied through machines that such activities are possible, and as metals and minerals must be employed in all machines and in all industries we are right in saying that mining is the basic industry; and as such its profits are certain. Men are attracted to it and risk their lives in its development. It is especially alluring on account of the accident of location. When an individual finds an ore body of profitable kind (either by systematic intelligent search or by blind discovery), he is the potential possessor of wealth. By calling machinery to his aid, he becomes stronger, wealthier, and more powerful. It is this fact that has attracted and impelled the mining pioneer.

We will now trace the development of mining by machinery, and return later to a consideration of what organized machinery means to the future of the industry. It was impossible until the invention of the steam engine to make radical changes or real progress in mining methods. The methods of Mexico under Cortez would be the methods of to-day but for the steam engine. It is the steam engine that has made possible the mammoth tool. The steam engine has also made possible the social machine; and it is the steam engine that has made possible the mining industry of our time.

There is no doubt that one of the first steps towards the advancement of the industry along modern lines was the development of better pumping methods and hoist-

*Mining Engineer, Traders Bank Building, Toronto.

ing facilities. This development can be followed from the days when mines were unwatered by means of chain buckets moved by horse whims. It is unnecessary to go into the history of pumps and pumping methods; suffice it to say that the steam engine made possible the Bob pit pump, the Cornish beam pumping engine, the steam pump underground, the air actuated pump and the electrical pump. Each machine, each application of power to a machine, was a distinct advance over the immediate method before it.

The rapid development of electrical apparatus has made power transmission remarkably simple, and it is now possible to install in the mine with ease, safety, and convenience, pumping machinery of a capacity undreamed of before.

Hoisting has passed through the stages of the hand windlass, the horse whip, the horse whim, and the steam hoist. The electrical hoist and the water hoist have reached a capacity and speed that would have been thought impossible fifteen or even ten years ago.

Pumping and hoisting and the use of modern explosives have simplified and amplified in every respect underground mining methods. The metallurgy of steel and the development of the mammoth machine have made possible "T" rails, modern ore cars, and underground conveying and transportation systems. Mine timber framing machines have made it possible to prepare timber sets on a large scale with great rapidity, and thus it is possible to mine for profitable return ground before untouched.

Underground electric lighting has further facilitated operations; and by again commanding the machine the miner is enabled to ventilate his workings with a measure of success formerly impossible.

The steam engine was followed by the steam hammer. The steam hammer is the pioneer of all great modern tools and itself is the predecessor of the steam pump and the rock drill, both of which are modifications of the steam hammer. It is, however, to the rock drill that we usually attribute the credit for the greatest advance in underground methods, and costs have persistently and consistently fallen as this machine has been modified and improved. The rock drill makes possible a great amount of work at a greatly decreased expenditure of human energy. It increases the mining scope of the particular enterprise engaged upon; it makes for speed in mining operations, and, like all valuable machines, reduces cost. The great advance in underground and surface transportation in and around mines, and in the long distance transportation of supplies and labour to mines, and in carrying the product from mines to distant parts, is no doubt one of the most important features in the evolution of the mining industry or of any other industry.

It is almost unnecessary to point out that any system of transportation is merely an aggregation of machines or an organized machine. The railroad is a machine in the economic sense. The mines must use this machine as their prosperity is directly influenced by the facilities for transportation.

Human labour has been used for ore transportation in mines in barbarous and in modern times. We have seen the gradual replacement of human and mule transportation by hoisting methods. We have seen the wheelbarrow in the stopes replaced by automatic devices, and we have seen the wheelbarrow thrown out of the crosscuts and drifts and the ore car substituted.

We have followed with interest the methods of water and pneumatic transportation. The windlass has given way to the steam hoist, the air winch, and the electrical hoist. Large stopes have been fitted with belt and gravity conveying systems. The gravity tramway, aerial tramway, and other rope tramways defy mountain ranges, gorges, and valleys, and render transportation easy, expeditious, and vastly cheaper. It is convenient to work all these appliances; but it is also profitable: therefore it is commercially possible.

Hydro-electric power has been called to the aid of the miner. Streams and rivers of the Western mountainous mining sections have been harnessed and their power utilized for transportation in the mines themselves, around the mines, and around the mills, smelteries, refineries, and reduction works where the mines' products are prepared for the user.

All this has meant that more work has been done with greater ease, with greater comfort, with more safety, with less men, and with more profit than ever before. It has, moreover, made it possible to work lower grade ore bodies of greater magnitude than previously for no other reason than that the machine is cheaper than the man. A perfect machine requires only intelligent directing labour and performs the work that many men were required to do in its absence.

Long distance transportation to and from the mines is part and parcel of the mining industry in any nation. You can no more separate the railroad machine as an integral part of the mining business than you can separate the ore body from the industry and retain the industry. The locomotive and the steam railroad are called into service transporting metallic products of the mines to suitable smelting points where coke and fluxes are obtained. These ores are smelted through the metallurgist's skill, and by the agency of his machines the metals are separated from the waste; and again the railroad machine conveys the mines' final burden to the manufacturer.

It is this great transportation system more than any one thing that has made possible the great and increasingly greater scale of mining operations carried on at present.

Before leaving the subject of underground methods it would be well to notice the simplification of stope mining which is indirectly caused through mechanical agencies. The ready facilities for timbering, the rapid transportation methods underground, combined with pumping and blasting methods have modified mining systems, which, while they may not all be safer for the workmen, are certainly simpler, cheaper, and more expeditious.

We should notice here the great influence of electricity on mining in the arid and semi-arid regions. Power has always been a factor in modern methods and some ore bodies were located where steam power was of prohibitive cost, but long distance transmission of electricity generated by water power has solved the problem, and we find mines now being operated in regions that even a few, a very few, years ago were thought impossible and unprofitable.

Of course it is hardly necessary to point out that mining and all its dependent activities are subject to considerations of profit. If any portion of the industry become unprofitable it is eliminated and abolished. The miner expects for the risk of his capital greater profits than in any other modern industrial undertaking—and gets them. It is only as machines are developed and an organization of machines put into use that lower and still lower grade ore bodies are worked with an increasing profit. There is no period in the history of the world that can show such large quantities of all metals being produced as can this period of our own; and there

is no age that can show profits from the industry so large.

Perhaps the best illustration of how machinery renders very profitable that which was formerly unprofitable and worthless is dredging gravels for gold. The gold dredge is a mammoth machine. Dredging may be considered a form of mining and is usually so regarded; but dredging for its success depends entirely upon a machine which has intelligent direction. It does not in any sense depend upon unskilled labour for its profits. It demands the highest type of machine, handled by the most intelligent direction. Profits from dredging operations have been enormous, and it is probably the best illustration in mining of making possible that which seemed impossible.

A form of mining now being largely carried on illustrates the development of lifting material by machinery intead of by hand labour. We have seen the basket replaced by the wheelbarrow for moving ore in a mine. In turn we have seen the wheelbarrow replaced by the ore car. We have seen the ore car replaced by the conveyor, by the steam railroad, and by the electric trolley; and we now witness in some of the most gigantic operations in mining the hand shovel thrown aside for the steam shovel, moving five or more tons of material every dip this mammoth tool makes. Probably no better illustration of intelligent directing labour applied to a complicated tool can be given than the steam shovel. Here we notice that one man operating the shovel and a few others directing its movements have replaced the multitude of ignorant, poorly-paid, unskilled labourers formerly wielding hand shovels. Ill-paid as these individuals were, the time factor alone made their work unsatisfactory. Their methods were slow, clumsy, unorganized, unskilled, and, therefore, unprofitable. No steam implement or tool such as the steam shovel will ever replace hand or any other labour if mass human labour be more profitable than the machine. The machine can only live where it is profitable.

The so-called porphyry copper mines are an illustration of three machines,—the machine of transportation, the machine of disintegration (or the steam shovel), and the washing machine or concentrator. This last machine is an interesting evolution. It has its beginning in the crudest form of washing. Everyone is familiar with the action of water in separating earthy ingredients from one another. This water separation was early applied through simple machines such as the pan, the cradle, the strake, and the sluice. Then we reach the time when machinery and steam were called into service. We find first the older and cruder appliances, such as the various bumping tables. The hand jig (one of the oldest machines) was replaced by the power jig. Then a combination of hydrostatics, mechanics, and power called together the various mechanical tables and implements used to make close separation between mineral and waste material. These have been organized under technical direction into mammoth machines known as concentrators. These organized machines have reached capacities of 6,000 tons of material per day and are yearly becoming greater. They employ comparatively few men and are monuments of human ingenuity and skill.

But this evolution is far from complete. The giant washing machine concentrates several tons of crude ore into one ton of valuable concentrates. These are then taken by the transportation machine direct to the modern smeltery, and here we find a development in the business of separating and reducing the mineral to its metallic state and its subsequent refining before the manufacturer takes the metal for his purposes.

It is unnecessary here to describe the modern smeltery. It is a mass of machinery organized and highly developed in conjunction with chemical processes. Its plan is laid so that great quantities of material can be quickly and cheaply smelted. Machinery replaces men as in all the other organized machines, and speed becomes the profit-maker as before.

It is interesting to observe the tendency to concentrate a particular operation required by several mines at a point convenient for this work. We have touched upon this matter in the case of smelteries and refineries, but it is not confined to these divisions. At Colorado City an example exists of chemical treatment on a large scale. To this point the refractory tellurium gold ores from Cripple Creek are brought for reduction. If facilities and conditions did not obtain whereby those ores could be handled cheaply and profitably—more profitably than at the mines themselves—the work would not be undertaken at this point. Power transportation and labour are the determining factors here.

By a review of all conditions covering any particular metal or mineral, we find that one or several operations required to fit it for human wants and uses will be carried on at such points, times, and places as will place production at the lowest possible cost and enable the miner to dispose of it at the highest possible price. The factors regulating this are labour, transportation, power and materials. Transportation and power are largely dominant factors and are yearly becoming more so.

In present times the question of the disposal of mine products has greatly occupied the attention of all operators. The metallic as well as non-metallic minerals in seeking a regular and profitable market have called in the services of engineers and organizers of the highest type. Oil flows through pipes, and the system of conveyance and pumping employed challenges the admiration of the world. Non-metallic minerals as coal, mica, talc, gypsum, and so forth are taken in hand by machines and processes directed by technical skill to improve their market chances and increase their usefulness. Consider for a moment how impossible all this would be but for motive power, invention, and organized direction.

THE FUTURE.

The miner of a few centuries ago relied principally on his own resources, as the shoemaker did in the days of Elizabeth. The miner of to-day is an organized specialist. He requires the services of the chemist for his analyses. The geologist explains the rock structure and guides his development. The electrician is at his constant call. The transportation engineer must be at his elbow. Without the metallurgist his vocation would become profitless. The mechanical engineer is his indispensable ally. He calls upon the skilled artizan of every trade, and daily he consults accountants and business organizers whose duty it is to specialize further the industry and increase its returns.

At no previous period was this effort possible. We rejoice in the achievement and regard the machine as our guide and the mechanical tool our master.

Mining as an industry is interdependent on all other industries, as all industries are directly dependent upon mining. There is no line of separation between mechanical engineering and metallurgical engineering. Transportation has become involved and in many instances intricately blended with the working of the mines.

As the machine is exact in its work and universal in its application, we have been called upon to train men to direct its work. Technical schools and schools of mines and science have multiplied like machines, and are training yearly in all civilized countries great numbers of young engineers, electricians, mechanics, geologists, chemists, builders, and so forth, whose business will be to apply science and nature's laws through the products of our shops and foundries.

It is but a few years ago that skilled technical men were scarce, and hence commanded high compensation, but with the increased application of technical knowledge to industry and the use of machinery this highly-paid labour will cease as its rarity vanishes. Moreover, the days of unskilled labour are going and only those trained for work of the kind the industry demands can survive. Machinery demands exactitude, and within the memory of our own time we have seen the business of mining gradually improving in methods. Guesswork is not so frequently indulged in. The inquirer is fortified by scientific training and this he applies to his investigations of new fields and camps through geologists, engineers, and others who are held strictly accountable to him and to the inexorable demands of his machinery governed industry.

We must perceive that the days of wildcatting and purely stock mining will gradually but surely end. Mining will take to itself a more defined, a more intelligent and organized method. It will have a plan: and the embryo of such plan is seen in the development and exploration tendencies of to-day. We will never witness a return to hand methods in mining or in metallurgy. The future is inevitable. We shall find greater machines, greater concentration, greater advances in economical methods, more cost reduction, continued replacing of unskilled labour by machines, and the unabated development and invention of newer, greater, and more complex machines applied to the uses and the business of mining.

Large masses of capital will be directed towards the systematic search of useful metals and minerals and will select and control the valuable deposits. It will consolidate and operate on a vast scale, using only the newest and best machinery for all purposes. More perfect technical control means the certain disappearance of hand labour.

Capital will gather all before it and march to an era of increasing profits in all mining undertakings.

This system of co-operation between financial men, engineers, technical men and skilled workmen will in the course of a not very distant future entirely eliminate competitive methods in the industry. The small operator of to-day is merely the forerunner of the great capitalist who is an organized miner. The smaller operator merely proves up and develops a valuable ore body for his successor. His methods of mining are what may be termed cheap and crude and, being competitive, cannot long exist adjacent to the well-managed, machinery-driven mine. In the course of time he is bound to be absorbed, consolidated, or swallowed by his greater rival. Competition is warlike and therefore destructive. Trustification is co-operative, and is, therefore, the logical outcome of industrial evolution. Regardless of beliefs, we are bound to admit the facts and observe the benefits of the co-operation which machinery forces upon us. This co-operation is responsible for the consolidations, rings, trusts, and monopolies that have entered industrial mining. We are ever confronted with evidence and indications of greater trusts and consolidations in the immediate future for the mining world. They are as essential as they are inevitable. Industrial evolution has no absolute end. The tendency to increase production, replace men by machines, and take advantage through the agency of trustification for the disposal of products and the regulation of markets is essential to the profits that organized industry demands.

Newer and more intricate machinery will be required which will be more self-operating as time elapses, which will be almost human in its ingenuity and will, therefore, ultimately have the supreme power of eliminating unskilled hand labour, performing its work better than human hands. This is a human demand:—that nature's laws shall be applied through and by machinery and this postulates the co-operative or trust method.

No process or agency of law can possibly destroy the trust. It is the product of industrial evolution.

The machine has its economic masters to-day who will become its slaves to-morrow. Any return to competitive methods would mean disaster and social failure. The advocates of competitive mining methods might as well abolish electricity and go back to the tallow dip; or destroy steam shovels and return to the coal scuttle; blow up the dredge and rejuvenate the sluice box; stop the locomotive and seek the mule; burn the concentrator and return to the cradle; or send a blacksmith hammer to compete with the steam hammer; abolish the stamp battery and drag out the pestle and mortar. In the age of organized machinery competition is absurd and will soon be a matter of history. The conclusion seems to be that organized co-operation by and through the agency of machinery is the principal cause of the unprecedented activity of the mining industry of our time. Co-operation of men and machines gives surer profits, greater profits with greater certainty, than at any age before us. We are forced to admit that the end is not in sight and that greater production than ever will be possible if the human race demands for use the miner's goods and is ready to pay his exactions. We see, therefore, that industrial evolution applies to mining and may in the course of time have a meaning generally unsuspected. At the stage we have reached we can only marvel at the stupendous work accomplished and systematization effected. Thus is mining freed from the glamour of romance and established as the most profitable of human undertakings.

OUR LONDON LETTER

New Union of South Africa Suggests Interesting Statistics—Effect of the New Rich Gold Discoveries in West Australia—Power Equipment of Collieries—Chartered Company's Boast Unwarranted — New Petroleum Mining Book.

(Exclusive correspondence of the Canadian Mining Journal.)

London, November 19th, 1910.

The finishing touch to the growth of constitutional government in South Africa has been put by the inauguration of the Union of South Africa. High hopes are expected from the concentration of South African Government functions. The London "Times" on November 5th issued a special South African number running to 68 pages, which, amongst other things, gave a complete review of South African mining statistics and matters.

It is said that the minerals at present being worked are gold, diamonds, silver, coal, tin, copper, lead, zinc, asbestos, magnesite, limestone, flint, manganese, etc. The total mineral output from the beginning of the indus-

tries to the end of last December is given as 2,110,000,000 tons, gold accounting for more than half of this figure. The number of workmen employed in the mining industry at June last is given as 31,084 whites and 276,371 Kaffirs—all the Chinese having been repatriated. This is more than double the number of workers for the same month six years ago.

The total salaries and wages paid last year by the Transvaal mines was $64,041,205, the Kaffir portion being $26,162,850. The average rate of pay per shift of an average of 8 to 10 hours on the Rand in December last showed that shift bosses received $6 per day and banksmen $3.50. Miners on stoping machines received $5 per day and hand-stoping workers $4.40 per day. Contract workers on all machines, of course, earned considerably more money. For example, shaft sinkers at daily rates received $6, while those working by contract earned $11. Cyaniders earned $4 per day and slimesmen $3.50.

The total assets of the Transvaal mines—gold, coal, diamond, and base mineral—at June 30 last year are given as $631,646,135. Last December the Rand gold mines had 9,327 stamps and 150 tube mills at work, the total yield being nearly $150,000,000, or a shade over $7 per ton crushed. As compared with the total world's gold output the gold output of the Transvaal has risen from .03 per cent. in 1885 to 33.05 per cent. at the end of last year.

The largest gold producer on the Rand is the East Rand Proprietary mines. This works 4,312 claims and employed last June 19,309 workers. There were at work also at June 820 stamps, the heaviest weighing 1,750 pounds, and 25 tube mills. The rock hoisted amounted to 2,236,464 tons, and the rock milled was 1,938,338 tons. The gold recovered, including the value of bye-products, was $13,826,615, and the dividends paid for last year amounted to $4,651,795. It should be noted, however, that this, though the biggest producer, is not the biggest dividend payer. This distinction is held by the Crown mines, which paid in dividends last year $6,110,690. The tons given here are all 2,000 pounds each.

The total coal production in Natal and the Transvaal amounted last year to 3,623,656 tons, employing 19,000 workers.

A lot of excitement has been caused here by the recent reports of rich gold discoveries in Western Australia. The Yilgarn goldfields are the centre of the rush and on all the Australian Stock Exchanges companies are being floated daily with quotations rising to substantial premiums. Frank Wilson, the Prime Minister, speaking in the Westralian Parliament, said: "Even Kalgoorlie and the Golden Mile sink into insignificance when one listens to reports regarding this property (the Bullfinch), which bids fair to eclipse anything discovered in the history of the State."

G. P. Doolette, one of the best-known figures in Westralian mining, is the lucky chief proprietor of the Bullfinch mine, the wonderful developments on which have led to the pegging out of claims for miles in all directions. Development work on this property over distances of less than 200 feet laterally and vertically is reported to have opened up ore valued at nearly $1,250,000. The width of the principal reef runs up to 24 feet and assays of many ounces per ton have been got. A shipment of 60 tons from the mine returned nearly 7 ounces per ton. A parallel reef is stated to assay 35 pennyweights per ton. (One ton here equals 2,240 pounds).

The line of contact between granite and diorite on which the Bullfinch has been discovered runs for at least 25 to 30 miles across country, so that the scope for prospecting operations can be realized. Of course, the Yilgarn fields are not really new. As a matter of fact, shipments of gold were made from the district as far back as 1889, but the recent Government aid to the water supply of the area has vastly stimulated prospecting, and the advisability of carrying a pipe line from the goldfields' water main is under consideration.

Although so far not a single share of the new flotations is on the London market, no doubt this is a lack which will soon be remedied.

Sam Mavor, Chairman of the Glasgow local section of the Institution of Electrical Engineers, chose for his inaugural address on November 11th the subject of power equipment of collieries. A brief resume of his remarks may not be out of place. He declared that nowhere more than in coal mining had the introduction of electric power been more advantageous. The acceleration in the rate of hauling and winding, especially in the deeper collieries, increased pumping, a higher standard of ventilation, the replacing of manual and animal haulage by mechanical means, and the introduction of coal-cutting machines and face conveyors had all contributed to increase the requirements for power. The screening plant and the washeries, and often by-products recovery plant in connection with coking ovens, had also created a completely new set of conditions, under which the cost of power, formerly regarded as of little moment, had, with the growth in size of power plant, been endowed with considerable importance; further, the competition in the world's coal markets and the rise in wages at home imposed the necessity of checking waste.

The colliery manager now realized that in problems associated with power production the aid of a specialist was indispensable, and the electrical engineer, whose training had enabled him to deal in detail with such problems, had established himself in the premier position in this department of engineering. Therefore the electrical engineer was often entrusted, not only with the planning of the electrical arrangements, but also with the whole scheme of power production and distribution. The field for the power engineer was co-extensive with our coal-fields, and the present extravagance of fuel would be appalling if it were not the measure of opportunities. The mechanical engineering of Continental collieries generally differed from those in this country in respect of the greater elaborateness and the style of the equipment. Such a scale of expenditure in this country would be considered ruinous.

The capital expenditure on Continental collieries amounted not unusually to $5 per ton of coal produced yearly, whereas in this country the average was about $2.50. While Continental practice contained a good many suggestions for this country, there were also many warnings, especially in regard to over-elaboration of detail. Multiplication of appliances could be justified only by economies in fuel or in labour, but it was not true that in Continental collieries the output was handled by fewer men than in this country. As a matter of fact the opposite was the case. Foreign visitors were often surprised at the large outputs of many of our collieries with plant that was apparently inadequate, and was handled by men the number of whom would be considered quite inadequate on the Continent.

The explanation lay in the fact that, while Continental colliery managers were engineers rather than pitmen, our managers, although less highly educated, were practical miners, who planned their operations and coal-handling plant with the primary object of saving labour. But if on the Continent there was extravagance in power

equipment there was surely parsimony in this country; between the two extremes there was room for a middle course, and much might be done at our collieries without risk of exceeding the limits of prudence. Machinery, Mr. Mavor concluded, at the coal face had increased the output per man, and had reduced the ratio of personal accidents.

"Twenty-one years ago," I am reminded, "Queen Victoria affixed her signature to a memorable document. On October 29th, 1889, the British South African Company received the Royal Charter vesting it with administrative powers in Africa from the Transvaal to Tanganyika. In 1890 the company's pioneer column occupied Mashonaland, and in 1893 the power of the Matabele was broken. The trials and difficulties of those early days are now a matter of history. The unknown land of 1889, steeped in barbarism, is the civilized Rhodesia of to-day, with an assured position among the younger British Dominions and with a steadily increasing population of farmers and miners. Then Rhodesia was entered at the risk of life; now the country is a recognized resort for tourists, and the forthcoming visit of the Duke and Duchess of Connaught shows how far removed the conditions of 1889 are from those of to-day."

I trust the achievement of the happy state of affairs thus described will not lull the directors of the Chartered Company into resting on their laurels. During these twenty-one years the company has never paid its shareholders a penny of dividend, while, generally speaking, the various mining and other companies formed to exploit the territories have involved their shareholders in heavy loss.

Beeby Thompson's new book on "Petroleum Mining and Oil Field Development" practically brings up to date the literature of oil well drilling to which so many thousands of practical men are now devoting their attention. The author is at one with those who believe that there are vast stores of petroleum in the British colonies and dependencies by no means inferior to the foreign fields. It is impossible here to deal with the book at length but I note in passing that the author, in discussing the important matter of the selection of a drilling rig, puts forward the opinion that for general prospecting in a new field where little or nothing is known of the geological strata, the Canadian system is one of the safest to adopt; it permits, he says, strata of nearly all kinds to be penetrated, and requires less skilled attention than many other forms of drillers, both in the Dominion and in Galicia where this drill has been vastly improved, will not be likely to acquiesce in the view that it is the acme of simplicity in drilling operations, and, of course, we have not reached a time when, with any tool in any formation, drilling can be conducted without skilled labour and unceasing watchfulness and care.

In the drilling system there is only one reference to the Galician system. This reads: "The Galician system is practically a normal Canadian rig in which light iron rods are used instead of ash poles." This is an unsatisfactory way of disposing of a matter of considerable importance, and scarcely does justice to the well-known ingenuity of the world-famous drillers of the Galician school. The Canadian system has been technically improved by them to work in the deep and difficult formations of the Galician fields, and this has been done to such an extent that it does not require an experienced operator to recognize the superiority of the Galician rig over others of the same system. These rigs work down to 1,400 metres, and it is not an unusual thing for them to drill the first 1,000 metres in ten months without a day's stoppage.

There is an excellent chapter on contract drilling, a subject which has been warmly discussed in the oil fields of Europe, together with some useful information about Baku, and a reference to oil field fires.

It is announced that a new German asbestos syndicate has just been formed, which includes practically all the German manufacturers. The previous cartel was dissolved at the end of last year, and since then keen competition has prevailed and prices have been reduced very considerably. It is intended to bring about a more profitable state of affairs, and a moderate advance in prices has already been announced. Germany is a very important factor in the asbestos trade, controlling a number of Quebec and Siberian mines, which now practically supply the world's asbestos requirements. The Italian mines are smaller, and the product is not suitable for many purposes, and this applies also to the output of the Griqualand mines. Although the fire-resisting properties of the mineral were known to the ancients, it was not applied commercially until towards the close of the sixties of the last century, when the industry was commenced in America. About the middle of the seventies asbestos works were started in England and Italy, and in the early eighties the first German works were erected. It is in Germany that the industry appears to have made most progress.

Granby Company's Annual Report

The tenth annual general meeting of stockholders in the Granby Consolidated Mining, Smelting and Power Company, Limited, was held in New York on October 4th. The following extract from the statement of accounts for the fiscal year ended June 30th, 1910, will serve to show production and other figures; also the charges as compared with the immediately preceding fiscal year:

	Year ended June 30, 1910.	Increase or decrease.
Copper sold, lbs.	22,570,111	I. 848,583
Silver sold, ounces	355,749	I. 20,228
Gold sold, ounces	48,804	I. 3,043
Receipts from above sales.	$4,099,925	I. $116,388
Working expenses and foreign ores purchased	3,534,978	I. 232,576
Balance	$ 564,947	D. $116,183
Interest, discount, depreciation, etc.	529,264	I. 361,636
Balance	$ 35,683	D. $477,824
Dividends paid	270,000	.....
Deficit	$ 234,317	I. $477,824
Previous surplus	$2,698,687	I. 234,506
Total surplus	$2,464,370	D. $234,317

The report states that the amount expended on new construction, and equipment at the smeltery during the year was $53,634. Mine development was 13,267 lineal feet, diamond drill development, 6,438 lineal feet; Granby ore smelted, 1,175,548 dry tons; custom ore smelted, 21,829 tons.

The average price received for copper sold during the year was 12.91 cents per lb., as compared with 13.22 cents in the immediately preceding fiscal year, and 13.33 cents in 1907-9. Average price received for silver sold

was 52.33 cents per ounce, as compared with 51.25 cents in 1908-9, and 56.25 cents in 1907-8.

The total cost of copper, all expenses paid after deducting the value of gold and silver produced during the year, was 10.34 cents per lb., as against 10 cents in 1908-9.

Attention was called in the report to the sale to shareholders during the year of 13,500 shares of the company's treasury stock, at $85 per share, it having been decided to capitalize a portion of expenditures incurred during recent years and which outlay was properly chargeable to capital account.

Accompanying the president's report were reports from Dr. Otto Sussman, the mining engineer who examined the company's mines last spring, Mr. Jay P. Graves, vice-president and general manager; Mr. O. B. Smith, mine superintendent, and Mr. W. A. Williams, smeltery superintendent. The most important parts of these reports are the statements of Dr. Sussman and Mr. Smith, respectively, concerning the estimated tonnage of ore available, and the prospects for finding more ore. Dr. Sussman estimates 5,595,000 tons of ore that can be extracted; the average grade of this ore he gives as 1.24 per cent. copper, and 0.04 ounces gold and 0.25 ounces silver per ton. Mr. Smith estimates, as at July 1st, 1910, 6,429,169 tons of ore blocked out, of which 90 per cent., or 5,780,252 tons, can be extracted; the grade Mr. Smith places at 1.25 per cent. copper, and 0.043 ounces gold and 9.925 ounces silver per ton. It will be seen, therefore, that there is so little difference between the two estimates, that either of them may be taken as representing generally the available ore and its average grade. Dr. Sussman says that the ore-bodies in the Old Ironsides-Knob Hill group, which comprise the chief ore-bearing parts of the company's property so far as known, decreased in size from the No. 3 level downward. "The 500-foot level and all the diamond-drill work done on the 500-foot level disclosed no ore. A number of holes were drilled from the 400-foot level downward: all of them after a few feet passed out of the ore and entered barren ground. All the holes drilled from the 300-foot level and from the surface in an attempt to find the downward continuation of the ore-bodies passed out of ore above the lowest workings of the mine; in some cases they did not disclose any ore at all. Consequently, the limits of the ore-bodies in depth have been found to be a few feet below the 400-foot level." Mr. Sussman's conclusion is that the chances of developing any large additional tonnage of ore are "exceedingly slim." Mr. Smith says that the chief mineral claims owned by the company have been fairly well prospected with diamond drills, the drill holes ranging in depth from 200 to 500 feet. In all the holes in which ore was found, the drills passed through the ore into barren ground before drilling was discontinued.

Now, while it may not be stated with positiveness that the Granby Company will not find other bodies of ore than those included in the estimates above quoted, present prospects are not favourable to the expectation that more ore in considerable quantity will be developed. Under the circumstances it would appear that the actual position as to ore reserves of ore has been withheld from shareholders in the company and the public. Last May the JOURNAL published this comment made by its British Columbia correspondent: "The management of the Granby Company has not at any time, so far as has come to my notice, made public any information that would throw doubt on the general belief that the reserves of ore in the company's mines were large and equal to all demands likely to be made upon them for a longer period than is now suggested they will last at present rate of production." A statement by Mr. A. B. W. Hodges, then local manager for the Granby Company, made at a meeting of the Canadian Mining Institute, at which were present a number of influential geologists and mining engineers from Europe, that "We" (the Granby Company) "have in one of our mines 10,000,000 tons of good ore," was quoted, also a statement printed in a special bulletin of the Institute that at the Granby mines "there is said to be approximately 20,000,000 tons of ore in sight." Surely common honesty demanded that such statements should be contradicted by those in a position to know the truth as to the approximate quantity of ore in sight. Or if it was the belief of the management that such statements were true, the competence of the manager may well be questioned, since about eighteen months later it is stated on excellent authority that the total quantity of ore extractable—not simply from one mine, stated by the then manager to contain 10,000,000 tons, but from the whole group of mines—is less than 6,000,000 tons, not 1,500,000 tons having meanwhile been taken out of the mines. The revelation now made is certainly a great disappointment, and it seems reasonable to conclude that some one or other withheld the truth. It is noteworthy that the reports of the mine superintendent, if he made any, have not heretofore been made public. Judging by the report by that official, now printed, it seems probable the actual position would have been made known earlier had he been permitted to tell it.

It must not be taken for granted, though, that the position of the Granby Company is a desperate or hopeless one. The company at the close of its last fiscal year had cash and copper in hand to the value of approximately $900,000; it has a five-years' supply of ore working on a scale similar to that of the past year; it owns valuable assets in addition, including a considerable interest in the Crow's Nest Pass Coal Company; it is a going concern with large and modern equipment and a reasonable chance of doing an increasing custom smelting business; and it is in a position to acquire other mines and thus enlarge its sphere of operations. Notwithstanding that confidence in the company has been rudely shaken by reason of unreliable statements as to its reserves of ore having been permitted to go uncontradicted, it may be expected that it will pay dividends as soon as there shall be a fairly good increase in the price of copper—a rise of only one cent a pound would add nearly $250,000 a year to its net profits at present rate of production—and there is also a fair prospect of an enlargement that will prove profitable and assist in restoring the company to favour among the investing public.

THE LARGEST CUSTOMS SMELTER IN MEXICO.

The Torren Customs Smelter—the largest in Mexico—is situated outside the City of Torreon. The plant is modern and is equipped with nine furnaces for the treatment of silver-lead ores, each with a capacity of 115 tons daily and a copper stack with a capacity of 250 tons daily. There is also a copper converter with a capacity of 15 tons daily. These smelters have ore-buying agencies throughout the mining districts of northern and central Mexico, and have been an important factor in the development of the base metal industry in Mexico.

Unique English Device for Detecting Fire-damp.

By Frank C. Perkins.

The invention shown in the accompanying illustration is a burner adapted to existing miners' safety lamps as devised by Sir H. Cunynghame and Professor Cadman for detecting fire-damp in mines.

This gas-testing device consists of a strip of this asbestos treated with a solution of carbonate of soda (common washing soda), to which a few drops of hydrochloric acid have been added. The strip of asbestos is held in a horizontal position when in use, 3-16 inch above the flame. The wire supporting the asbestos is carried in a similar manner to a pricker wire through the vessel of the lamp, and when not in use is swung away from the flame.

In order to test for gas the strip of asbestos is brought over the flame, when gas (if in existence) is visible in a cap above. It is stated that in addition to the simplicity of the invention and the cost being exceedingly small, it commends itself to the mine manager, as it is unnecessary to reduce the flame while testing for gas, thus avoiding the chance of losing the light.

In using the device without lowering the flame, by means of the trigger the asbestos paper is turned completely over the flame. In the absence of gas, only the yellow flame is seen. When there is gas the cap is easily distinguishable, as it appears above the mantle and is quite sharp. As the percentage of gas increases, the cap becomes higher, until when it is about half-an-inch high there is one per cent. of gas. At two or three per cent. of gas the cap becomes very striking, being easily seen from a considerable distance. The brightness and clearness of the cap may be much improved by a little skilful manipulation, so as to bring the pieces of asbestos into the best position.

In case the piece of asbestos becomes broken or worn by constant use it can be replaced by another readily and without difficulty. It is stated that the usual care must be taken not to keep the lamp longer than necessary in dangerous quantities of air, containing, say, 3 or 3½ per cent. of methane.

It is said that experiments are being conducted by the inventors with a view of standardizing the appearance of the cap, due to various percentages of fire-damp.

Electric Smelting

Bulletin 3 of the Department of Mines entitled "Recent Advances in the Construction of Electric Furnaces for the Production of Pig Iron, Steel, and Zinc," has just been issued. The bulletin opens with a review by Dr. Haanel of present conditions and is followed by translations of several interesting Swedish papers on the subject of electric smelting. The rapid advance made in electric steel furnaces is evident from the fact that in 1904 when the first investigation was made by the Department of Mines there were only four electric furnaces in existence. In 1910 there were 114 furnaces of which 67 were in operation, 11 not working and 36 in the course of erection. Of these furnaces 30 were in Germany, 23 in France, 12 in Italy, 10 in Austria and 10 in the United States. Seventy-seven of them were of the arc type, 55 were induction furnaces and 2 a combination of the arc and resistance furnace. The capacity of furnaces has also greatly enlarged during the past six years, 15 metric tons being the size of the largest. These furnaces are used in the refining of high grade steels.

Notable advancement is also being made in the smelting of iron ore. As Mr. Bennie informed us at the meeting of the Canadian Institute last March, "It is no longer right to say that electric smelting will come; it has come." In a paper by Yngstron the operation of an electric shaft furnace at Domnarfvet, Sweden, is fully described. The paper opens with a theoretical investigation into the quantity of carbon required. There follows a description of the plant with a reference to the first furnaces built and the reasons for their failures. A full description is given of the operation of the furnaces, methods of charging, consumption of power, electrodes, ore, flux and carbon, analyses of pig iron produced, etc. The conclusions of the author are as follows: "Judging from the results achieved by the experiments at Domnarfvet, the problem of making pig iron from iron ore in the electric furnace seems to be technically as well as commercially solved, but in order to ascertain fully this matter, further experiments ought to be

conducted on a larger scale. The necessary condition for a profitable smelting of iron ore in the electric furnace is that sufficient and cheap electric power is available. The following are some points in favour of the electric furnace:—

(1) Cheaper cost of erection of the furnace, as blowing engines and hot blast stoves are not required.

(2) Saving about two-thirds of the fuel required in the blast furnace.

(3) Fine ore can be handled in the electric furnace without previous briquetting.

(4) The gas evolved has a high thermal efficiency, being free from nitrogen.

(5) The possibility of producing directly in the furnace iron with low carbon content.

(6) Some reduction of labour, as only about one-third of the fuel required in the blast furnace is to be handled.

It will probably prove advisable later on to combine the electric shaft furnace with an electric steel furnace, in which the liquid iron from the shaft furnace could be refined.

Other smelting furnaces are said by the bulletin to be in course of erection in Norway and in India.

Other papers in the bulletin are on:

1. Electric furnaces for the reduction of spelter and zinc oxide.
2. The Fick Electric Reduction furnace.
3. The Fick Electric Steel furnace.

The director of the Department of Mines is to be complimented on the issue of a bulletin of this character giving the authoritative results of foreign practices in electric smelting.

A. B. W.

Cobalt Mines Royalties

During the year 1909 according to the annual report of the Bureau of Mines four Cobalt mines paid the Ontario Government $338,426.66. Two of these properties have this year received a considerable reduction in their rate of payments, so that it is not likely to be so large. This, of course, takes no account of the royalty paid to the T. & N. O. Commission, which is another department of the Government.

From the sale of 81 parcels of land on the Gillies Limit $711,458.30 were obtained. The annual report in this particular of revenue and from sale and royalties reads:

There was received during the ten months from mining royalties the sum of $338,426.66, as follows:

Crown Reserve Mining Company	$145,437.46
O'Brien Mine	141,497.15
Temiskaming & Hudson Bay Mining Co...	44,403.26
Chambers-Ferland Mining Company	7,088.79
Total	$338,426.66

The Crown Reserve pays a royalty of ten per cent. of the value of the ore at the pit's mouth, this being one of the conditions of purchase from the Crown. The O'Brien mine contributes on a basis equal to 25 per cent. of the receipts from the sales of ore, less a proportion of surface expenses, and there is a similar arrangement with the Chambers-Ferland Company. The Temiskaming & Hudson Bay Company pay at the rate of 15 per cent. of the net receipts.

The accruals on account of royalty for the calendar year 1909 were as follows:

Crown Reserve Mining Company	$160,437.46
O'Brien Mine	141,497.15
Temiskaming & Hudson Bay Mining Co,..	52,263.62
Chambers-Ferland Mining Company	16,259.64
Total	$370,457.87

Of the amount only $338,426.66 fell due and was paid within the fiscal period.

Up to 31st October, 1909, there has been received by the Department in mining royalties an aggregate of $779,434.68, as follows:

O'Brien Mines	$474,357.52
Crown Reserve Mining Company	174,695.31
T. & H. B Mining Company	123,302.06
Chambers-Ferland Mining Company	7,088.79
Total	$779,443.68

ROCK CRUSHNG PLANT

Of Messrs. Laurin & Leitch.

(Written by PAUL C. VAN ZANDT.)

General Description.

The rock crushing plant of Messrs. Laurin & Leitch, engineers and contractors, Montreal, Canada, is unusually interesting from its enormous capacity of production and remarkable flexibility of operation.

Having obtained from the Montreal Water & Power Company the contract for constructing within four years a reservoir of 43,000,000 gallons at Outremont, one of the city's suburbs, they recognized the advantage of crushing and marketing the rock at the time the excavation is made, instead of piling it on a waste bank, the usual custom in the past.

As the reservoir will be 800 feet long, 400 feet wide and 40 feet deep, formed partly by excavation and partly by enclosing walls, it will be necessary to crush within four years approximately one million tons of hard trap and granite rock and to provide storage for approximately one hundred and fifty thousand tons in various sizes after crushing so that it can be marketed to the best advantage.

The limited time at the disposal of the contractors and the enormous quantity of stone to be removed within that time necessitated the erection of one of the largest rock crushing plants in the world.

[Editor's Note.—The magnitude of the crushing plant herewith described is our warrant for publishing the following article. The whole plant is a study in the reduction of operating costs.]

Quarry.

The site of the reservoir from which the rock is quarried is upon the north slope of Mount Royal, and quarry operations have been started at the lowest point in the reservoir site, where an excavation of approximately 20 feet has been commenced. From this point the quarry face will be gradually cut back towards the mountain parallel with the lower edge of the reservoir. The rock as fast as quarried is loaded direct by steam

Photo No. 776

shovels into six yardside dump quarry cars, which are made up into trains of four each, to be hauled to the crushing plant. The rock is drilled by Temple electric drills along the quarry face, which is 800 feet in length, and, after blasting, the cars are brought alongside of the steam shovel, close to the bank of blasted rock, by a Shay locomotive which is of the geared type so as to take the grades, pushing the empty cars up to the

Photo No. 779

quarry face, and bringing the loaded cars from the quarry face to the bottom of the incline haulage system leading from the lowest point in the reservoir to the crushing plant.

Hoisting System.

The crushing plant is situated upon an excellent site about 1,500 feet from the centre of the reservoir, and to bring the rock from the excavation to the crusher a haulage system has been installed operating in balance, drawing a train of four loaded cars up the haulage incline of about 4 per cent. to the foot of the two incline trestles leading from the ground to the dumping hopper over the large crusher. At the same time, a train of four empty cars is lowered down the haulage incline back to the quarry, balancing in part the up-going load. At the upper end of the haulage incline there is a third track for empty cars, and the trains of loaded cars which are gathered upon first one and then the other of the two outside tracks shown upon the cut accompanying this article, are hauled up these incline trestles of approximately 20 per cent. grade, one at a time and alternately upon each of the two trestles, as shown in photo 776, so that the large crusher is receiving a carload of rock first upon one side and then upon the other, making its operation almost continuous. The empty cars are dropped to the middle track for assembling into trains for the down-going trip on the haulage incline. All the switches shown are spring switches operating automatically, excepting the one that delivers the empty train to first one and then the other of the haulage tracks going back to the quarry.

Crushing Plant.

The crushing plant contains five Allis-Chalmers gyratory crushers. One of these is a No. 21, which is the largest gyratory crusher in use at the present time, having a capacity of 1,000 tons per hour. It has two openings, 42 inches across by 8 feet in length, shown in photo 779, each opening easily capable of receiving a piece of rock 3 feet x 5 feet x 10 feet, weighing 10 tons, which is the limit in size of any single piece that can be loaded by a steam shovel or carried on a single truck. This crusher, shown in photo 757, which weighs 225 tons, has crushed a piece of rock this size in forty

seconds down to pieces the size of a man's head and smaller. The primary object of this large crusher and the great advantage in its use is the elimination entirely of hand sledging in the quarry, and almost entirely of the re-drilling and re-blasting of large pieces of rock which may have been broken from the ledge in the quarry by a primary blast. Almost everything that comes down after a blast in the quarry can be loaded at once by the steam shovel and sent up to the

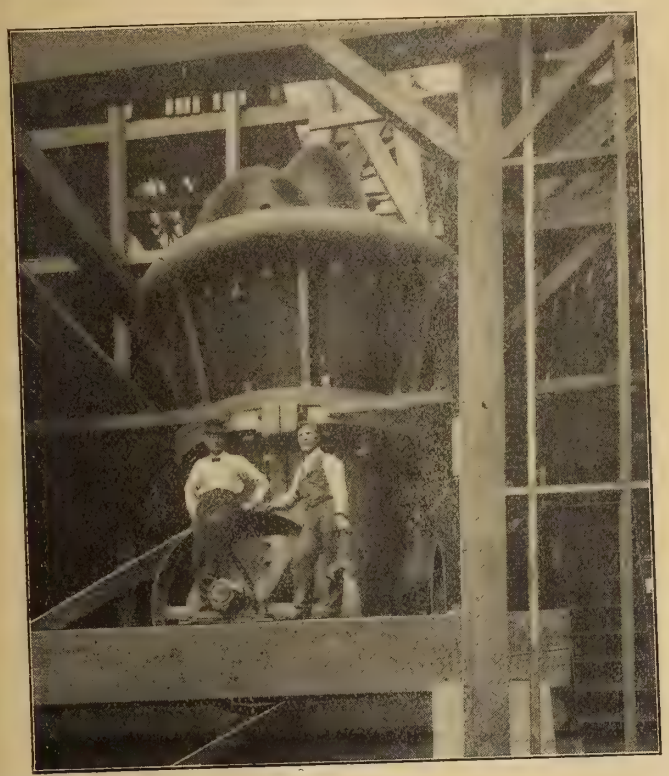


Photo No. 757

crusher without further work being done upon same. As hand-sledging, re-drilling, and re-blasting of pieces once broken from the quarry face, when smaller primary crushers are used, are always the largest items of expense in quarrying, it can readily be seen that the use of so large a crusher effects a great saving, even if we eliminate consideration of its large capacity. This crusher is made with a double discharge, each discharge spout delivering to a No. 18 bucket elevator and each of the two elevators delivering to a 6-foot diameter screen having approximately 2¾-inch openings, shown in photo 762. At this point a rough separation of the rock is made and any incidental fines from the first break that pass these openings are delivered to a cross belt conveyor which, in turn, delivers them to a short elevator and from this to a rotary screen 24 feet long over the rock storage bins. These incidental fines in this way by-pass the secondary crushers and are delivered to the bins direct ready for shipment. The rejects, or oversize, from the 6-foot diameter screens are delivered to two bins which feed six No. 6 Allis-Chalmers gyratory crushers. One of these bins and four of the crushers, shown in photo 760, are installed at the present time and a spout is arranged to take the oversize from one of these 6-foot diameter screens and deliver it direct to the present bin. The rock in this bin runs out of the four corners into the four No. 6 crushers automatically, and these crushing continuously reduce this oversize rock to marketable size (2½-inch and smaller), and all four deliver to a common belt conveyor, from which the re-crushed rock is received by a No. 8 elevator, which in turn delivers it to two rotary screens 24 feet long, duplicates of the one already mentioned, located alongside of it over the finished rock bins. The smallest product from these three screens consists of rock ¾-inch and smaller, which is divided again upon three shaking screens into dust, ⅛-inch product (which is a fine clean sharp sand), ½-inch product and ¾-inch product. The remaining sections in the 24-foot screens separate the crushed rock into 1¼-inch, 2-inch and 2½-inch sizes. Each of the above sizes is spouted directly into a compartment in the storage bins, directly beneath the point where it is screened, with the exception of the dust, which is conveyed in a dust-tight screw conveyor to a bin compartment properly covered over. The rock, which is very hard and clean, sizes very accurately, producing the very best of marketable stone.

Storage System.

The storage bins mentioned above have a total capacity of from 2,000 to 3,000 tons, and the bulk of the product is spouted direct from these bins into cars and waggons for shipment. The shipping tracks shown upon the illustration run under three of the compartments, the remaining two being for teams. The spouts and gates from the storage bins are so arranged that any bin may be made to deliver its product to a car or waggon in the compartment on either side as well as the one directly beneath the bin, making it very easy to load more than one size into a car at the same time or to load the same size into two or more cars at the same time. No provision is made for recrushing any of the different sizes of rock, but the excess of any size that does not market as fast as made is stored on one of four storage piles. The capacity for storage being approximately 150,000 tons, is sufficient to take the entire product of the plant for about 75 working days. When rock is to be stored, the particular size of which there is an excess is drawn from its bin on to a belt conveyor, which carries it out from under the bin to the system of storage conveyors extending over the storage yards. There are two belt conveyors extending under

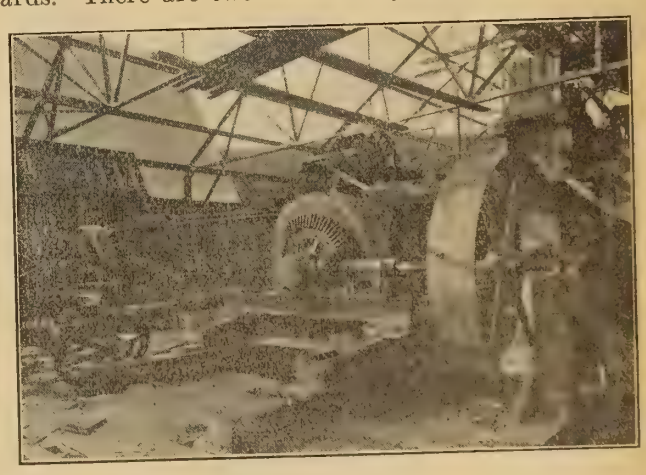

Photo No. 762

the bin, so that two sizes of rock may be piled at the same time, and the conveying system is so arranged that any size can be piled on any pile. The amount of rock to be stored cannot be predetermined and is not the same throughout the year. Moreover, some sizes are marketable only during the summer, while other sizes are marketable during the entire year, thus making the flexibility of the storage system above described of paramount importance. The conveyors used in this

storage system are partly 20-inch and partly 24-inch belt conveyors of the Stephens Adamson make, and the long storage piles are provided with moveable trippers which distribute the rock over the pile where desired. On account of the extreme hardness and sharpness of the rock, the belts are made of the best Diamond Rubber Company's brand, with 3-16-inch rubber cover for the narrower belts and ¼-inch rubber cover for the wider. One specially interesting feature of the conveying system is the distributing centre, where the two belt conveyors leading out from under the bins deliver the material into two small hoppers, where the product from either of these belt conveyors may be delivered to the same piling conveyor, or to any one of the three piling conveyors, without interfering with the other.

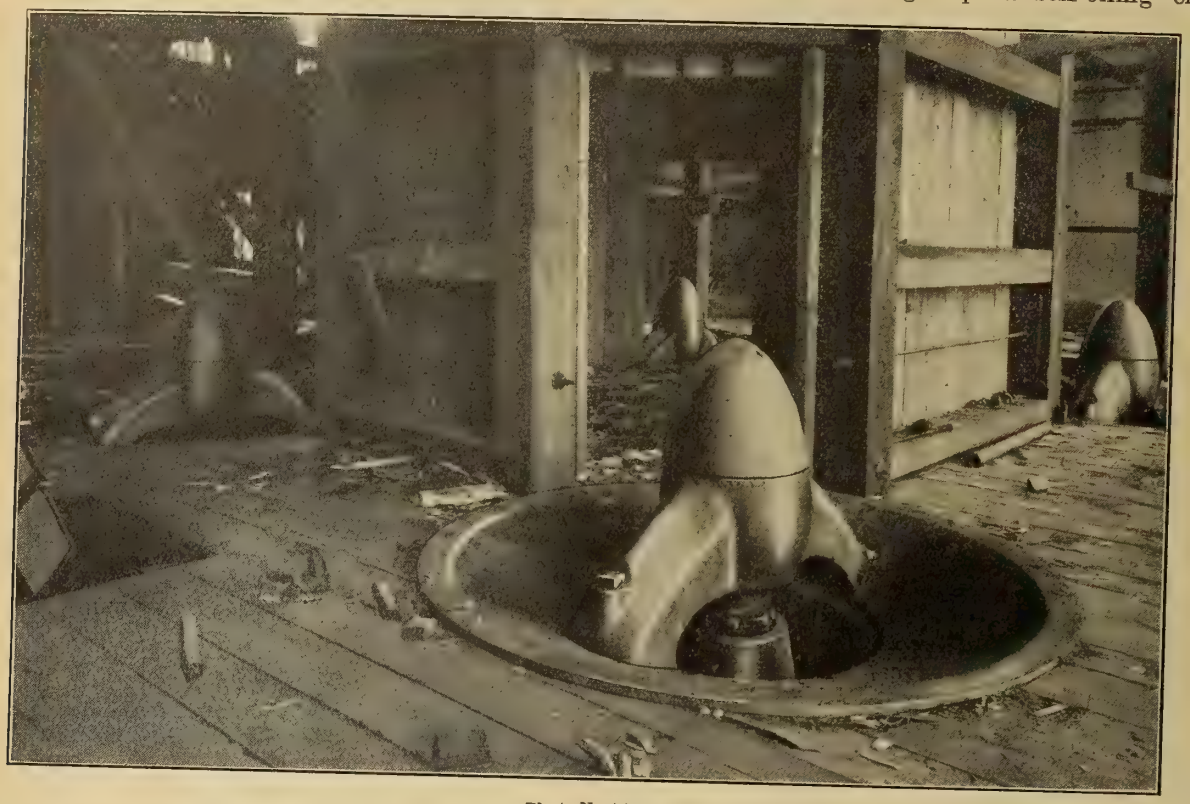

Photo No. 760

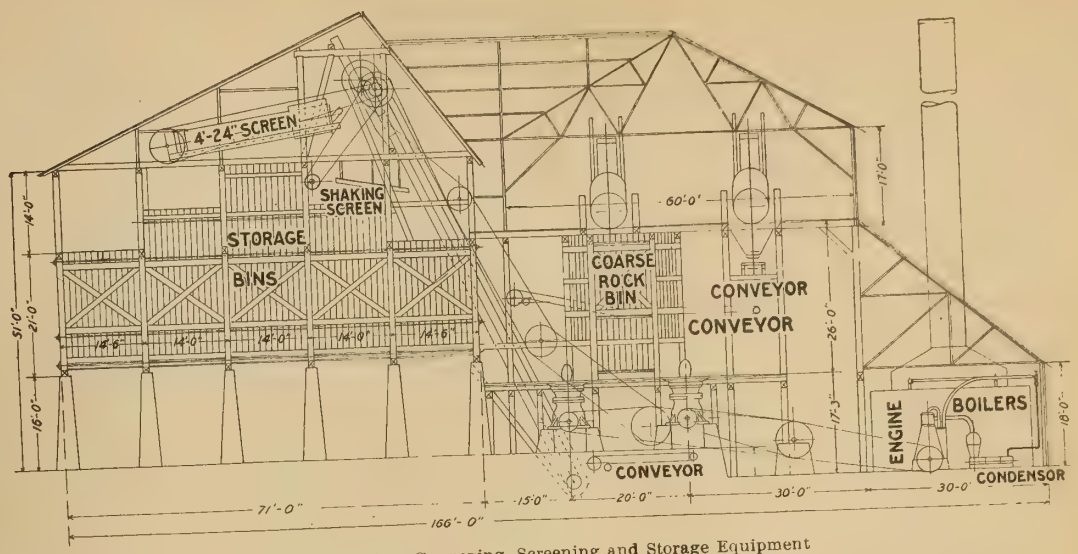
Shipping Arrangements.

The rock loaded directly on the cars from the bins is brought out upon the track shown in the illustration, photo 776, past the scales (which are of the Fairbanks-Morse recording type, printing upon a ticket the gross and tare), and from this point the railroad track leads to the street railway system of Montreal, upon which it can be distributed to any point in the city, or to any railroad or wharf for further shipment. The waggons leave the property from the other side, passing over another set of scales of similar type.

When the rock that has been piled on one of the storage piles is shipped, it is loaded in a railroad car or waggon placed alongside of the pile by steam operated clam shell derrick crane, made by the Bay City Industrial Works, which has a one-yard clam shell bucket upon a 40-foot boom so that it can reach from the car to any point upon the storage pile adjacent to it, so that the additional cost of rock taken from the storage pile when delivered upon cars is only a cent or two more than that delivered direct from the bins.

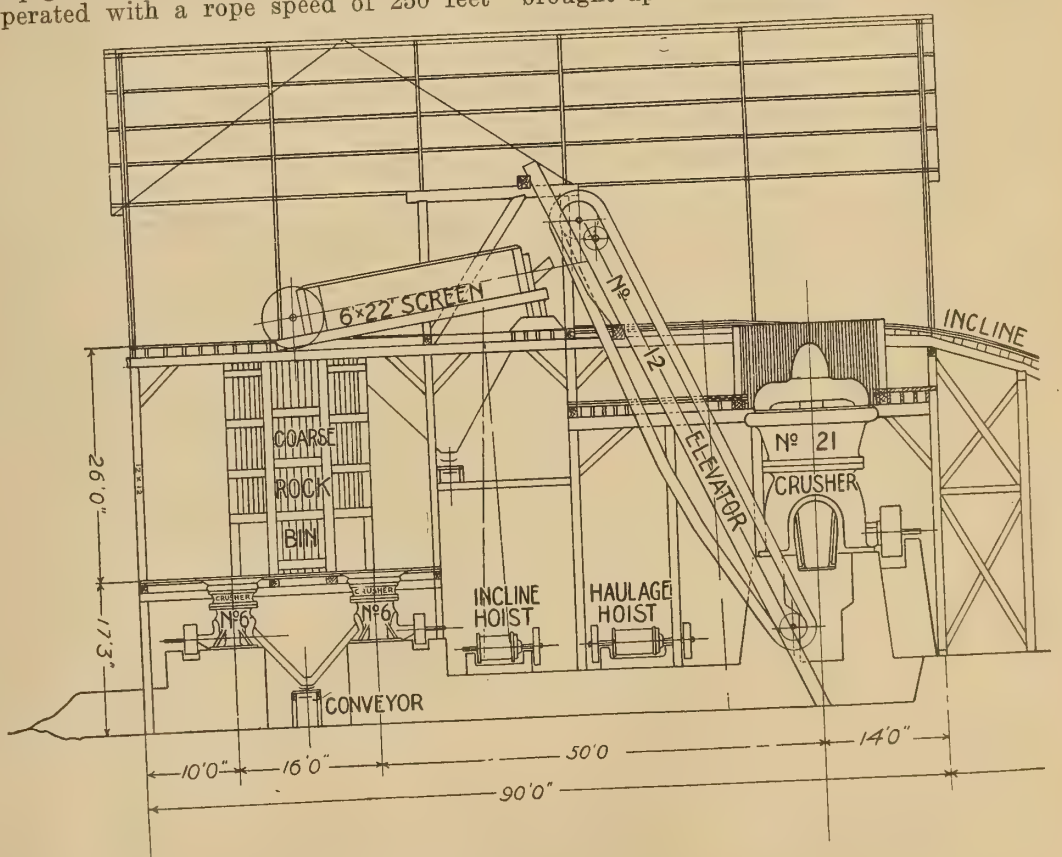


Power Plant.

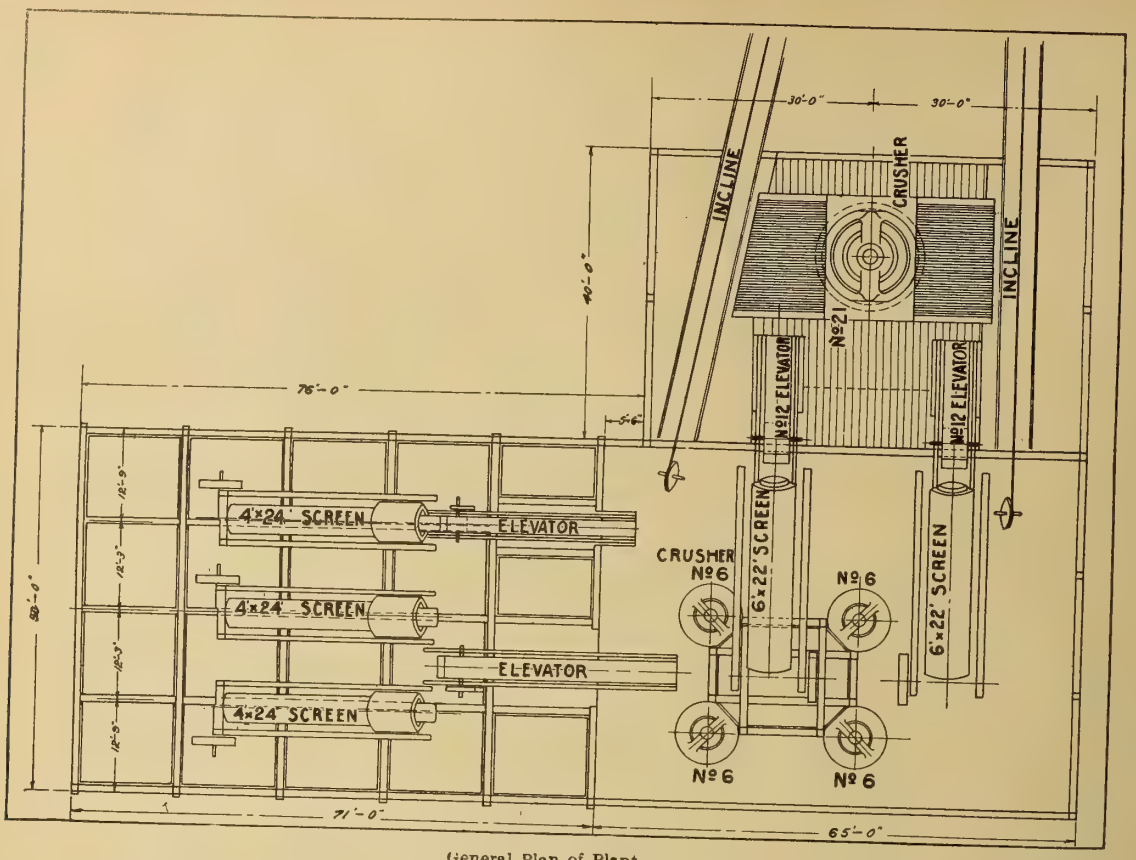
The power plant consists of two 250 h.p. Erie City water tube boilers, and one 720 h.p. vertical triple expansion Belliss & Morcom engine, this engine being connected by an English system rope drive to the main line shaft which is, in turn, belted to the various machines mentioned. The belt conveyors are driven by Allis-Chalmers-Bullock induction motors, and the electric current for these (as well as for the Temple drills in the quarry and for lighting) is supplied by 175-k.w. Allis-Chalmers-Bullock generator. This generator is of the belted type, receiving power from the main line shaft, but is placed in the power house in line with a McEwen automatic high speed self-oiling engine of sufficient power to drive the generator when used either for operating the motors or the drills or the lighting system, when the main engine is shut down. The big

Photo No, 763

engine is run condensing, delivering the steam direct to a Knowles pump and condenser located alongside of it. The hot water from the condenser is elevated by a Worthington centrifugal pump to a water cooling tower



Section showing Conveying, Screening and Storage Equipment



just outside the power house. Condensed steam from the auxiliaries is sent through a water heater and steam pressure upon the boilers is maintained at a constant amount of 160 pounds by an automatic blast arrangement. The steam plant is one of the most economical that can be installed, the advantage of which is seldom appreciated in a rock crushing plant.

Hoists.

The hoists are of the Allis-Chalmers-Bullock friction type. There are three hoists, one for the haulage system with a 4-foot drum long enough to wind 1,500 feet of rope upon it, which operates the haulage system with two ropes, the down-going cars balancing in part the weight of the up-going loaded cars. The hoist is reversible and operated with a rope speed of 250 feet per minute, bringing a train of cars from the extreme end of the quarry to the plant, in approximately five minutes. The remaining two hoists are for the two incline trestles, hoisting by a friction band and lowering by a band brake. The speed of these hoists is also 250 feet per minute, bringing a car from the foot of the incline trestles to the crusher hopper in about 45 seconds. The three hoists work in unison and are all controlled by one operator located above the crushing floor at a point where he can see the cars both at the bottom of the incline and at the dumping point. The speed of the hoisting equipment is such that by the time a train of four empty cars has been lowered to the quarry and four loaded cars have been crushed and returned to the empty track, four additional loaded cars have been brought up from the quarry.

Section Showing Crushers

General Plan of Plant

Auxiliary Apparatus.

Over the No. 21 crusher are installed two Yale & Towne triplex chain blocks, of 20-ton capacity each, for handling any of the heavy parts of the crusher should there be occasion to make repairs. The track for these blocks, which are fastened to a trolley or crawl, may be seen upon the illustration, showing how any part may be lifted clear of the building or a new part lifted in. Smaller crawls and chain blocks are provided over the number sixes and elsewhere around the plant. There is a belt conveyor for carrying coal direct from cars to the boiler house. There is a large machine and blacksmith's shop alongside of the plant, provided with a 24-inch x 18-foot lathe, a planer, radial drill, blacksmith's forge, steam hammer and other proper equipment. This shop is driven by an Allis-Chalmers-Bullock induction motor, so that it may also be operated when the crushing plant is not running, receiving current from the generator described in the power house.

Reservoir.

The reservoir, which will be the largest in Montreal, was designed by Mr. Frank H. Pitcher, chief engineer of the Montreal Water & Power Company. Approximately one-half of this reservoir is to be completed first and put into operation, while the remaining half is being completed. The main water pipe leading from this reservoir is now being laid by Messrs. Laurin & Leitch, and consists of a line of 60 inch cast iron pipe, the laying of which, with its valves, etc., is in itself an item of considerable interest, but which is dwarfed in comparison with the quarrying and crushing operations going on.

General.

This plant is unusual in many respects: primarily, on account of its size and initial cost in proportion to the amount of work to be done under this contract. The size of the plant and the excellence of its equipment result in a saving in the cost of construction of the reservoir and the disposal of the rock taken from it which should pay for the entire equipment. It has sufficient capacity to crush the rock as fast as taken from the quarry, so that the product can be marketed immediately after excavation. The rock is handled but once from the excavation to the marketing, and in this way it is immediately disposed of and is out of the way. The rock is excellent in quality and instead of being thrown away on a waste bank, as was the case of the rock taken from the excavation for the Chicago drainage canal, for example, is made to yield a profit. Messrs. Laurin & Leitch use a very great quantity of crushed rock in their own work on other contracts, noticeably street paving, concrete work, and other engineering work of similar character, and a portion of this rock will be used in this way, the cost of which will be less to them than rock purchased upon the open market. The plant, which was designed and equipped by the engineering force of Allis-Chalmers Company, possesses an unusual flexibility of operation in addition to unusual economy of production, so that it may be operated to suit both the work of excavation and the market for crushed stone, producing rock for the lowest possible cost of production. The plant is exceedingly compact, resulting in the smallest possible buildings, and is well arranged for operating with the smallest crew of men. One man handles the hoisting and haulage equipment, two men the dumping of cars and feeding of crusher, two men the handling of cars at the foot of the incline trestles, one man for the spring floor, one man for the number sizes, one man for the transmission and hoist floor, one engineer, two boiler men, one oiler and two men upon the conveyors, loading, etc., and these men constitute the entire operating force of the plant. One side of the haulage incline may be operated independently of the other if necessary, as can also one of the

incline trestles. One side of the No. 21 crusher, with its elevator and screen, can be operated independently of or without the other. Any one or all of the number sizes may be cut out temporarily, and when the balance of the plant is shut down rock may still be loaded or piled on the storage piles, or the drills at the quarry may be operated.

A Remarkable Compressed Air Mine Locomotive

By FRANK C. PERKINS.

The powerful mining locomotive utilizing compressed air as a motive power, shown in the accompanying illustration, is utilized by the Lehigh Valley Coal Company and has a total weight of 18,000 pounds and a tractive force of 3,260 pounds. The storage tank has a pressure of 800 pounds per square inch, while the working pressure is 140 pounds, the air tank capacity being 95 cubic feet.

Compressed air locomotives operate in a similar manner to a steam engine, the cylinders receiving air under

pressure instead of steam. On this air engine the cylinders measure 8 inches in diameter, and have a stroke of 12 inches, the power being transmitted to the driving wheels, which are 28 inches in diameter, in a similar manner to an ordinary locomotive.

This compressed air mine engine was designed for a gauge of 4 feet, and has a wheel base measuring 4 feet in length, the total length of the locomotive, over the bumpers, being 14 feet. The width of the locomotive is 5½ feet and its height only 5 feet 7 inches, these limits being necessary on account of the low and narrow passages encountered in the mine.

Hidden Creek Copper Mine, Observatory Inlet, B.C.

The Spokesman-Review, Spokane, Washington, recently published an interview with Mr. W. Yolen Williams, consulting engineer to the Granby Consolidated Mining, Smelting & Power Company, Limited, as follows:

"It is the general opinion in northern British Columbia that the Hidden Creek mine is destined to be one of the biggest producers in that province. My own judgment from all the surface indications and a study of the deeper development to date, is that I can see little chance for this estimate to be mistaken.

"One feature of the property which impresses me especially is the facility with which mining can be done cheaply, as great depth can be obtained by open cuts. The mine is located within two miles of the company's wharves on Goose Bay, and the site of the projected smelter. The latter is admirable both for convenience in handling ore from the Hidden Creek mine, and for receiving custom ores from the Portland Canal district, northern British Columbia and Alaska generally.

"Before I left the mine the plan of operation for the winter had been outlined. The intention is to continue work on the main crosscut tunnel, which is now 736 feet long, and to concentrate work there so soon as the season necessitates the suspension of surface operations.

"This tunnel cuts the first vein at a vertical depth of about 400 feet from the surface and extends 300 feet beyond that lode. It entered the ore body on an angle and was in ore for 125 feet. Considerable drifting has been done here on the hanging wall side of the vein.

"The winter's work will consist of extending these drifts and thoroughly exploring the ore body by crosscuts, with supplemental diamond drill work, both for depth and distance along the vein.

"At the same time the main crosscut will be driven about 300 feet further ahead, from which point the diamond drill will be used to prove the extent and value of the ore bodies in the second vein.

"The surface showings of both ore bodies, which are known locally as the Cabin and Mammoth bluffs, are large and promising. The Mammoth bluff is the one not yet reached by the tunnel. While both ore showings are of a similar character, the Mammoth bluff shows much the larger ore body and the better grade of ore of the two. Both have been extensively prospected by surface cuts."

The Spokesman-Review added the following information: Mr. Williams was a member of one of two parties sent north about the same time by the Granby Company to resume the development of the Hidden Creek mine, which is located on Goose Bay, Observatory Inlet, the latter being a branch of Portland Canal, which forms the boundary line between British Columbia and Alaska. The two parties included, beside Mr. Williams, Mr. M. K. Rodgers, the former manager of the property, who still retains a one-fifth interest in it; Mr. O. B. Smith, jr., superintendent of the Granby mines at Phoenix, B.C.; Mr. H. McDonald, an engineer long in the employ of the Hidden Creek mine; and Mr. Page Boyle, a diamond drill expert. They were accompanied by a force of miners and three crews of diamond drillers. All arrived at the mine about the same time. Mr. Smith has remained to see the work well started, while Mr. Williams returned to Spokane, in order to look after the development of the Cliff and Consolidated St. Elmo mines at Rossland, B.C., also under bond to the Granby Company.

During the winter a force of twenty men will be kept continuously at work on underground development of the Hidden Creek mine, and it is expected that by spring enough will be known about the property to justify the carrying out of Mr. Jay P. Graves' plan to equip it with a matting plant as a feeder for the Granby Company's smelter at Grand Forks, B.C.

Personal and General

Mr. I. L. Merrill, of Los Angeles, California, president of the Hedley Gold Mining Company, has been spending a week or two looking over the company's Nickel Plate mine and 40-stamp mill at Hedley, Similkameen, B.C.

Mr. A. H. Gracey, of Nelson, left the Kootenay for Spokane, Washington, on his way to Vancouver, B.C., where he will spend the greater part of the winter.

Mr. Ernest Levy, manager of the Le Roi No. 2, Ltd., at Rossland, and the Van Roi Mining Company, the latter operating a silver-lead mine in the Slocan Lake district of British Columbia, recently spent a week at Vancouver and other coast cities.

Mr. Geo. W. Wooster, of Grand Forks, B.C., treasurer of the Granby Consolidated Mining, Smelting & Power Company, was in Seattle, Washington, late in November.

Mr. J. E. McAllister, of Greenwood, B.C., general manager for the British Columbia Copper Company, went to New York lately on a business visit.

Mr. E. A. Bradley, well known in the Revelstoke mining division of British Columbia in connection with hydraulic gold mining in the Big Bend of the Columbia district, has been to Spokane, Washington.

Mr. George H. Aylard, of New Denver, Slocan Lake, B.C., was in Spokane early in the month, on his way to Victoria.

Mr. H. L. Rodgers, manager of the Yankee Girl Mines, has returned to Ymir, B.C., from conferring with the directors of his company, which has its headquarters in New York.

Mr. Wm. Yolen Williams, consulting engineer to the Granby Consolidated Mining, Smelting & Power Company, Limited, returned to Spokane late in November from the Hidden Creek Copper Company's mine, Observatory Inlet, B.C., which mine the Granby Company is further developing under an option of purchase of four-fifths interest in the Hidden Creek Company.

Mr. C. W. Laing has resigned the position of construction engineer for the Dominion Coal Company, and has acquired an interest in the Brown Machinery Company of New Glasgow.

Mr. Richard Kirkby, the mining engineer of the Dominion Coal Company, leaves for England about the middle of December. He will spend Christmas there, and will return to Glace Bay at the end of January. While over in England Mr. Kirkby will inspect colliery plants and coal washeries.

Mr. Reginald E. Hore, of the Michigan College of Mines, and formerly of Toronto, was recently appointed Assistant State Geologist of Michigan. He is now in charge of the Houghton office of the State Survey. During the past summer Mr. Hore worked in the iron districts of Michigan.

Mr. J. B. Woodworth has returned to Toronto from inspecting several mines in the southern states.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay, General.—The Dominion Coal Company's output for November was 325,174 tons. During the first half of the month the mines worked full time and the rate of production was higher than it had been during the whole of the shipping season. The St. Lawrence season closed about the twentieth, and during the last half of the month the mines have not worked so regularly. Extensive alterations are being made to the screening plant at No. 2 Colliery, for coal from the Phalen Seam. Both Nos. 2 and 9 Collieries were closed down for these alterations for a period of five days. The height of the dump is being very much lowered to eliminate breakage, and a screening plant with shaking screens and picking belts is being installed, which should very considerably improve the product from No. 2 mine.

The total output to the end of November for the eleven months of the year is 3,266,230 tons, comparing with 2,527,422 in 1909, and 3,377,225 in 1908. December output may possibly reach 300,000 tons. The record annual output from the Dominion Coal Company's mines was 3,555,068 tons in 1908, so that it is quite possible that 1910 may break all records for annual production. Taking into consideration the fact that the U. M. W. A. strike was not declared off until the 28th of April, this showing is an exceedingly good one. By the close of the year the contribution to the general output from the new mines in the Victoria-Lingan district will amount to almost a quarter of a million tons. It is only a little over two years since this district was opened up.

The St. Lawrence shipments for the season amounted to 1,227,667 tons, comparing with 961,904 tons during the season of 1909.

Rescue Stations.—Referring to notes on "Rescue Stations in Great Britain," that recently appeared in the Journal, the following account of the use of breathing apparatus may be of interest.

The Denaby and Cadeby Collieries Company operate extensive and deep mines on what was formerly regarded as the Eastern fringe of the South Yorkshire coalfields. The workings have a high temperature, partly owing to the depth and partly to the tendency of the seam to "gob-fires." As a result of one of these gob-fires, an accumulation of black-damp had made its way from the older Denaby workings to the present workings in the Cadeby mine. In order to clear the ventilation it was necessary to remove some obstructions in the area filled by the black-damp. It was decided to utilize breathing apparatus for this purpose, and a party of four men descended the No. 2 shaft and walked for a distance of one mile to the point where the damp was coming off. They encountered a good many obstructions, and it was necessary to crawl for a considerable distance along old roads with very narrow area. The party succeeded in removing one old brattice stopping and had reached another one when two members of the party asked to go back, stating that their strength was giving out. This was not due to any lack of oxygen, but to the intense heat, which is stated to have been in the neighbourhood of 160 degrees. The party turned back and arrived in the fresh air of the intake after an absence of an hour and a quarter in the old workings. The following day Mr. T. W. Mosby, who was the leader of the first party, with two fresh men and one man who had been a member of the party on the previous day, made another attempt to clear the ventilation. This time, however, they substituted mouthpieces for the helmets that had been used the previous day. Mr. Moseby states that the party felt more comfortable with the mouthpieces and, after working for one hour and a quarter, they succeeded in clearing away all the obstructions, and by six o'clock on the following night some three hundred yards of the Cadeby workings had been cleared of damp.

It may be mentioned that the apparatus used at most rescue stations are now so arranged that they can be used with either the helmet or with the mouth-breathing arrangement. Certain circumstances seem to require the helmet type of apparatus and

other circumstances are more favourable for the mouth-breathing type. In fighting a mine fire where the apparatus party have to face intense heat in their endeavour to get near the flames, there can be no doubt that the helmet type of apparatus is the only one that will afford the necessary protection to the face and head. On the other hand, where a rescue party has to make its way for a long distance through constricted passages in a heated and humid atmosphere, the mouth-breathing arrangement is stated by many experienced men to be preferable, because it admits of free perspiration and enables the head to be kept cooler.

In the working test above referred to, the apparatus used was of the Draeger type and the party had received their training at the Wath Rescue Station. Mr. Mosby's opinion of the usefulness of breathing apparatus, as given to a newspaper reporter, is interesting as being the opinion of a man who knows from experience what he is saying. It is as follows: "If life is in jeopardy in a mine through accumulation of gas, and there is a road for the rescue team to travel on, they will be able to fetch a man out without any danger to themselves; provided, of course, that it can be done under the two hours limit. A lot depends upon the man's stability, and the man with plenty of lung power who is able to stand great exertion and great heat stands the best chance."

ONTARIO.

Cobalt.—In the week ended December 2 over a thousand tons left the camp. This is probably the heaviest week that the camp has known: certainly in silver ounces it was.

The McKinley-Darragh output for November was 320,000 ounces and the estimate for the year is two and a half millions. The Savage is now producing between 50,000 and 60,000 ounces per month.

In November the McKinley-Darragh shipped eleven cars of concentrates.

The shipments for November increase the lead for 1910 as the banner year to almost 3,000 tons, in spite of the large number of mills and the bullion shipped instead of the low grade ore. Twenty-two mines shipped in November, against nineteen in October. The increased production is to some extent due to the higher price of silver, the ore being rushed out while it is still at 55 or 56 cents to the ounce.

November was also the heaviest month for bullion shipments that the camp has known. Four mines put out $87,243, the Nova Scotia contributing $32,579.96, the Buffalo 5,750, the O'Brien $22,932.80, and the Crown Reserve $24,268.67. Altogether 176 bars were exported in November.

At the annual meeting of the Cobalt branch of the Canadian Mining Institute the following officers were elected for the year: Mr. Chas. A. O'Connell, chairman; Mr. A. A. Cole, secretary-treasurer, and Messrs. Norman Fisher of the Temiskaming, Hugh Park of the Nipissing, and A. E. Culbert of the O'Brien, the committee. Mr. A. A. Cole was nominated as the representative of the Cobalt branch for the General Council of the Institute. The speeches of the evening were by Professor Miller on the International Geological Conference which he attended at Stockholm, Sweden, and Mr. Cyril Knight's very brief impressions of Porcupine's geology.

On its property in Munro, eight miles east of Matheson, the Detroit New Ontario is now installing two fifty horsepower boilers and a four-drill compressor. The intention is to sink to the 400-foot level and to crosscut from that point.

A shaft is being sunk on the Valentines Mines claim at the south end of Cross Lake. It will be put down a hundred feet by contract on the No. 8 vein and afterwards at that level the strong calcite leads discovered on the surface will be cut.

Seven hundred feet north of its No. 3 shaft and 500 feet southwest of its No. 1 the Hargraves has run into high grade ore again at the 375-foot level. The vein will average about three inches wide and may probably run 4,000 ounces to the ton. The find was made in the long crosscut run from the No. 3 shaft parallel to the Kerr Lake line.

From the winze 65 feet below the 200-foot level of the City of Cobalt a vein of high grade from half an inch to two inches has been struck. The find was made on the Cobalt Townsite boundary and undoubtedly runs into that property.

The Rochester Cobalt is now trying to borrow $25,000 on the property in order to continue development. Directors can sell 69,000 shares of stock at ten cents each.

The Nipissing will build a big concentrator for its low grade ore, and for the purpose of discovering the best method of treating it, it has erected on its property a large sampling plant. The Nipissing is now concentrating only at the Kendall, where the low grade is handled by the Nipissing Reduction Company.

In addition to the usual three per cent., the McKinley-Darragh has declared for the New Year disbursement a 12 per cent. bonus. The McKinley-Darragh will have paid on January 1, 49 per cent., or $1,144,914.30.

There is an electric rate war between the Cobalt Hydraulic and the British Canadian Power Company all over Northern Ontario. The Fasken interests within a few weeks have obtained the control of the Cobalt Power Company, the Cobalt Light, Heat & Power Company, and the New Liskeard Power Company. All these companies are supplying power and the Hydraulic air.

The 60 tons shipped by Cobalt Lake will net that company, after freight and treatment charges, somewhere in the neighbourhood of $10,000.

While there is no possible doubt that the ore reserves of the La Rose Consolidated have almost been doubled by the discoveries on the Lawson, the La Rose and the Princess, it does not seem likely that the dividend will be increased next quarter.

The new lateral vein alone on the La Rose has increased the ore reserves of the company by $2,000,000.

The new vein on the Lawson continues to show excellent values, and it has been opened up for a distance of 60 feet or more. For that distance at the 200-foot level it averages nine inches and is 4,000 ounce ore and upwards.

Porcupine.—After allowing a private company to commence cutting the right-of-way for an electric railway into the Porcupine the Ontario Government have decided that they will build into Porcupine themselves, and have voted $450,000 for that purpose. The work done by the Haileybury syndicate holding the charter has been taken over by the Government, and it is said they will be compensated. There will be no loss of time in pushing forward the construction of the railroad.

Few assays from the 100-foot drift on the main vein of the Timmins go below $15, and many hundreds have been made. A winze is now being sunk below the 100-foot level on ore.

There is a very keen demand for claims in the Porcupine area, New York and English buyers in particular seeking anything in a good location in Tisdale, Whitney, Shaw, the Reserve, and Langmuir.

Very considerable interest is being taken in Langmuir Township, near Night Hawk Lake. Claims have been selling freely there for good sums. Victor Mattson, the Swede, who found Gold Island in Night Hawk Lake, has discovered native silver in a wide dike of calcite and barite. It has been stripped for 1,200 feet and the native shows in several places. It is exciting the greatest interest in the camp.

Several more banks have decided to locate at Porcupine. The Traders is already there and the Bank of Ottawa. Now it is announced that the Imperial Bank and the Bank of Commerce will establish branches this winter and the Royal Bank will also be represented.

Several plants have already been ordered for the Porcupine camp. The Timmins has completed its order for a 30-stamp mill, the Dome has purchased a 12-drill compressor, the Rea Mines have had shipped in a 20-horsepower boiler and a hoist, and the Foley-O'Brien a 4-drill compressor and two 50-horsepower boilers.

New Brunswick capitalists have bought the Walsh claims in the Reserve for $50,000 with a first deposit of $2,500. The dike is reported to be 100 feet wide with good free gold showings.

On the Powell claims in Porcupine another good find has been made in the discovery before the snow fell of a 40-foot wide vein of porphyry carrying free gold. Camps have been erected on the Powell claims and a road cut in from the Dome.

There was a very pronounced rush over the Porcupine trail once the route was declared open for sleighing and heavy traffic. The early and severe frost should make the ice good and the going fine.

The Powell Claim

Mr. P. Kirkgaard, head of the Deloro Smelting & Refining Company, has purchased the Feldon claims in Tisdale, the purchase price being $35,000.

The breaking into articles of freight on transit into the camp and the many wholesale robberies of prospectors' shacks that have occurred in the camp have aroused a very bitter feeling among mining men, and they demand some protection from the law.

The Burns-Goad claims, the centre of the important section in the southwest of Shaw, have been sold to Toronto capitalists for, it is said, $100,000 with $5,000 down. The Redstone River section has grown in importance, as has also the whole of Shaw Township, very much in the past two weeks.

There is a rush of stakers into Thomas Township, and some of the claims staked are already disposed of to syndicates who are ready to throw them into companies or to take a gamble with them themselves.

The Hon. Frank Cochrane, Minister of Lands, Forests, and Mines, Mr. J. H. Black, superintendent of the T. & N. O., and Mr. Clement, the chief engineer, have all visited the Porcupine camp within the past two weeks.

South Lorrain.—On November 29th power was turned on from the Beaver Lake substation of the British Canadian Power Company, and the Wettlaufer and the King George are now running with the juice. The company has 1,500 horse-power available for the use of the camp. Only transformers are being established at Beaver Lake, as the company will supply nothing but electricity.

Since the seven tons of high grade ore was shipped from the Bellellen at South Lorrain the drift has been continued on the vein at the 70-foot level for some distance. Another shaft is being sunk on the Little Keeley vein which shows six to eight inches wide of solid smaltite.

Though no official announcement has been made it seems most probable that the Lewisohns have agreed to take up their option on their big block of Wettlaufer stock, which will give them control of the mine. The mine is proving a bonanza.

Gowganda.—There will be at least three shippers from the Gowganda camp this season, with the possibility of two more. The Millerett has ordered a 10-stamp mill completely equipped for fine sampling, and the Reeves-Dobie is expected to have its new machinery in operation by the end of this month at least.

The Calcite Lake Mining Company has struck into some rich ore at the 92-foot level of its shaft after sinking on a comparatively barren calcite vein. The company is now bagging ore and may ship this winter. Close by the Bishop Gowganda is also getting results. Calcite Lake is eight miles south of Gowganda.

At Gowganda itself the Mann has found a 6-inch vein of 500-ounce ore which the presence of mills in the neighbourhood renders of some value if it does not improve in grade. The Bartlett's new control are stoping out all the silver they can see in order that they may get out a car to continue development with.

At Miller Lake, in addition to the activities of the Millerett, where a good surface discovery was made before the snow fell, the Miller Lake O'Brien has developed into a shipper this summer. At the 80-foot level there is an almost continuous ore body showing high grade for 200 feet, while the vein as drifted on at the 150 is stronger and richer than at the upper level.

Tests made in Toronto show that the dump ore and the low grade in the mine at the Millerett will run 44 ounces to the ton. Concentrates from this ore run 1,400 ounces.

The Morrison, near Miller Lake, is sinking two shafts on its big vein, which up to a short time ago showed mainly bismuth. Now in one of the shafts a small but rich lead of native silver has been cut right in the big calcite lead.

Other sections in the Gowganda district, where various properties have made good, are Hangingstone Lake, where the T. & H. B. Co. has taken up its option on the O'Gorman and Sweet claims; Spawning Lake, where the Thompson Mining Company found a fine surface vein; Shining Tree and Smoothwater. Everything has been held up by bad transportation and the seducing of capital into better advertised fields.

BRITISH COLUMBIA.

The western branch of the Canadian Mining Institute will hold a general meeting of its members at Nanaimo, Vancouver Island, in February, when the papers and discussions will be chiefly on coal mining matters. It is proposed to hold the spring meeting at Trail, where are situated the big smelting works and lead refinery of the Consolidated Mining & Smelting Company of Canada, Ltd. The removal of Mr. A. B. W. Hodges to South America several months ago further reduced the resident representatives of the West, which may yet have to consider itself fortunate to have any at all on the council of the institute. What will be the eventual result of this position, unsatisfactory as it is to many western members, remains to be seen. Last year Ontario and the East rejected every western nominee to the council but one.

Recently declared dividends were as follows: Hedley Gold Mining Company, quarterly distribution at the rate of 12 per cent. per annum; Le Roi No. 2, Ltd., two shillings per share on 120,000 shares; Crow's Nest Pass Coal Company, 1 per cent. Both the Le Roi No. 2 and the Crow's Nest Pass Coal Company paid similar dividends earlier in 1910.

East Kootenay.—More ore has lately been found in the St. Eugene mine, but particulars have not yet been made public. This mine is owned by the Consolidated Mining & Smelting Company, and in the company's last annual report it was stated that the ore reserves were estimated at about 20,000 tons, which was taken to indicate that the ore bodies had been nearly exhausted. The information regarding the finding of more ore is reliable, but whether the ore is in sufficient quantity to be of much importance has not yet been ascertained. However, the improvement in the situation is a little encouraging, even should a further change for the better not take place in the immediate future. It is hoped, though, that persistent exploration will eventually result favourably, and the life of the mine be thereby prolonged.

At the several collieries of Southeast Kootenay much coal is being mined and shipped. The Crow's Nest Pass Coal Company is working two collieries, namely, Coal Creek and Michel; the Hosmer Mines, Ltd., has made a much larger production of coal this year than last; and the Corbin Coal & Coke Company has also considerably increased its total output. There is little being done to further develop the large coal field in the upper Elk River country, which is still without railway or other transportation facilities.

Slocan.—The Rambler-Cariboo will ship ore soon, snow having fallen and the hauling being consequently easier. The Lucky Jim is continuing development work, this including driving another adit. The new opening is only a little above the railway track, so will give greater depth than has yet been reached, the other adits being well up the side of the mountain.

In the Cody neighbourhood, the Noble Five is reported to have found a vein of ore of good width and grade, but particulars have not been made public yet. The long raise from the deep-level tunnel of the Surprise mine to the old workings 800 feet above is more than halfway up, and a fan has been put in the level below to improve the ventilation for the miners.

Near Sandon, the Richmond-Eureka and Hope are both still working, but the Slocan Star has been closed, it is stated, for the winter. Little is being done at mines high up the mountains, for deep snow usually makes it not practicable to work them to advantage in winter. Near New Denver, the Mollie Hughes is being worked, and is sending out an occasional car of ore of good grade.

In the vicinity of Silverton, the Standard, Van Roi, and Hewitt mines remain the most important in the Slocan Lake district. The Standard will resume shipment of ore as soon as the snow shall be deep enough to make a good road; meanwhile, the ground is too soft for heavy hauling. This mine has one of the finest showings of galena ore ever seen in the district; at times there is fully 20 feet of clean ore in the face of No. 5 tunnel. The erection and equipment of the Van Roi concentrating mill is being proceeded with as rapidly as local conditions will permit; it is expected this work will shortly be completed. Much ore has been opened by new workings in the Van Roi mine. The Hewitt has shipped but little ore during recent years, but instead, the management has steadily pushed development work, so as to have large reserves of ore for milling whenever it shall be decided to commence concentrating on as large a scale as milling facilities will allow.

On Ten-Mile Creek, the Ellis Silver Mining Company, of Toronto, working the Eastmont mine, and Mr. S. S. Fowler doing development work on the Enterprise, which he holds under lease from its British owners, are the only ones mining in the district south of Silverton.

Rossland.—Recent developments on the Consolidated Mining & Smelting Company's Centre Star group of mines have been satisfactory. In the War Eagle mine, one of the group, another body of ore containing higher value in gold than much of the ore usually obtained from this group, was lately entered by the diamond drill, at 75 feet below the twelfth level. Development previously done on the twelfth level had proved the existence there of a strong vein, but the ore taken from it was of low grade, so the diamond drill was used to prospect it below the level, with the result that good ore was found. Assays of samples from over a width of 5 feet gave returns up to 3.24 oz. gold per ton, and 0.4 per cent. copper. Of three average samples assayed, two were found to contain gold at the rate of above 3 oz. to the ton. This development is an important one, and it resulted from following down some small streaks of ore first met with above the tenth level. Sinking from the twelfth level is in progress, preparatory to opening a stope in the high-grade ore discovered by diamond drilling, as above mentioned. Stope No. 1168, above the War Eagle eleventh level, which has been opened since the company's annual report, to June 30th last, was made, has been yielding a considerable tonnage of ore of good quality. In the company's Centre Star mine, too, developments have been generally satisfactory, with pay ore on several levels, though not of so high a grade as that in the War Eagle. Diamond drilling is being continued in the lower levels of this mine, but as yet not much good ore has been found in the bottom of the mine. In both the Idaho and Iron Mask mines stopes are continuing to yield a fair tonnage of ore for smelting.

Progress is being made with deep development by the Le Roi No. 2 Company. The cross-cut driven about 1,000 feet south on the 1,300-foot level some time ago entered a large ore body, but the value of the ore thus far opened is less than was hoped for. There has not yet been time, though, to do any considerable development in the ore. It contains a fair percentage of copper, which is regarded as a promising indication. The greater part of the development so far done on the 1,300-foot level has necessarily been dead work, in consequence of which but little has yet been ascertained concerning the ore-body, but there is believed to be good reason to look for profitable development later.

Ore is still being extracted from some of the old workings of the Le Roi. There have been rumors in circulation relative to prospective buyers of this property, but the liquidator has announced that nothing definite has yet taken place in the direction of its sale. Two properties in the south belt of Rossland camp, namely the Mayflower and the Blue Bird, are looking well, both having opened good showings of galena ore. Further development of these finds is in progress and it is hoped permanent good results will follow. The I. X. L. is being worked in a small way under lease, with profit to the few men working it.

Trail.—The Consolidated Mining & Smelting Company's smeltery is receiving a comparatively large quantity of ore, both from its own mines and those operated by others, the latter being chiefly silver-lead properties, the production of which is much smaller than that of copper mines. The supply of copper ores is being well maintained, but lead ores are not obtainable in such quantity as during the years 1908 and 1909. Several mines that shipped a considerable tonnage in those two years have not latterly been producing, though one or two of them are expected to do so shortly. Meanwhile improvements are being made at the smeltery as occasion calls for them.

Boundary.—Work has been resumed in the Greenwood-Phoenix Tramway Company's tunnel, Greenwood, with 22 men employed. Mr. Duncan McIntosh, manager, has received assurances from Chicago, where the larger shareholders in the company reside, that money will be provided for driving to a distance of at least 3,000 feet. The dimensions of the tunnel are, approximately, 9 by 8 feet. The face has lately been in hard granite, but it is thought less difficult ground is not far ahead, after reaching which progress will be greater than under existing conditions. The tunnel is in about 800 feet.

At the Granby Consolidated M. S. & P. Co's smeltery, Grand Forks, preparations were made last month for blowing in Nos. 7 and 8 blast furnaces, and thereafter operating the smeltery up to its full ordinary capacity. Meanwhile arrangements had been made at the mine to again make the daily output of ore equal to the requirements of the eight blast furnaces. Since the destruction by fire several months ago of the ore-crushing and shipping facilities at the No. 3 tunnel outlet from the mine, the quantity of ore shipped daily has been curtailed. Temporary arrangements have been made to ship from No. 3 by way of the 200-foot level, which has been connected with No. 3 by a raise. On the 200-foot level the ore is trammed to the Victoria shaft, hoisted thence to the surface, and shipped over the Canadian Pacific Railway to Grand Forks. Next spring a new crushing plant and shipping bins will be provided at the outlet from No. 3 tunnel, and after completion of these works it will again be practicable to ship over the Great Northern, which has rail-

way connection with that outlet, though not with the Victoria shaft.

The maximum treatment capacity of the British Columbia Copper Company's smeltery at Greenwood is now about 2,600 tons daily, but the ordinary day's run, with all three furnaces in blast, is, when conditions are favourable, 2,400 to 2,500 tons of ore. Before the enlargement of two of the blast furnaces, about 1,800 tons was the quantity ordinarily smelted with three furnaces operating. The company is trying to maintain an average output of about 36,000 tons per month from its Mother Lode mine; 18,000 tons from the New Dominion Copper Company's Rawhide mine (operated under the same management); 3,500 tons from its Wellington camp mine; 2,500 tons of sulphide ore from the Napoleon mine, near Marcus, Washington; while the remainder of its supply comes from other sources. An aerial tramway, 29,000 feet between terminals, is being constructed, from the company's Lone Star mine, distant from the smeltery eight miles and situated immediately south of the International Boundary line, in the adjoining State of Washington. This tramway will have a carrying capacity of 20 tons an hour. Its lower terminal is at the site of the Boundary Falls smeltery (not now being operated), and connection thence with the smeltery at Greenwood is by C. P. R.

The Consolidated Mining & Smelting Company of Canada, Ltd., beside shipping ore from the Snowshoe mine, which it works under lease, is also preparing to send ore to its smeltery at Trail from its Phoenix Amalgamated group, which adjoins the Granby Company's property on the south. The company is also shipping ore from its No. 7 mine, conveying it over an aerial tramway to bins on the C. P. R. line at Boundary Falls, where it is loaded on cars for Trail.

A first carload of coal has been shipped from the small coal mine being worked three miles west of Midway. Some indications of coal have been discovered on Myers Creek, between Midway and Rock Creek, and prospecting work has shown that a short distance below the surface there is a 4-inch seam of coal which is widening as it is sunk on. A small local organization will ascertain whether or not coal in workable quantity occurs here.

Similkameen.—In the Lower Similkameen, the Hedley Gold Mining Company is completing putting in steam machinery and plant to provide for continuing operating the stamp mill throughout the winter, which has not always been practicable when dependence was placed on water power only. About Princeton, higher up the Similkameen Valley, beside the Princeton colliery, from which coal is being shipped regularly, other coal properties are being opened, these including the coal measures of the United Empire and the Osoyoos Coal Company, both of which are reported to have workable seams of coal. In the Granite Creek district the Columbia Coal & Coke Company, of Winnipeg, has done much development and is putting in power plant; its known coal reserves are large, and its enterprise is well managed and is stated to be adequately financed for development purposes. Another industry, the establishment of which is in hand, is that of manufacturing cement, for which a company has been organized. The extension of the V. V. & E. Ry. from Princeton to Granite Creek, now well on towards completion, is benefitting the district materially.

Coast.—From a London journal it is learned that the annual meeting of the Tyee Copper Company was held in London on November 10th. The chairman was reported to have said: "During the year the price of copper had been even lower than in the previous year, and the effects were such as to hamper the company's business seriously, mine owners having no inducement to proceed with development, to ship ore actively, or to open new mines. Nevertheless, the company had received 21 per cent. more ore than in the previous year. The quantity received, however, had only sufficed to keep the furnaces running 188 days, yet, as the standing charges were the same, whether the furnaces were fully or partially employed, the financial results afforded hope of improvement. Between May 1st and August 1st, 1910, the ore received was 19½ per cent. in excess of the quantity for the corresponding period of 1909. The manager reported that negotiations for the acquisition of an important group of properties had been almost closed. He (the chairman) was sanguine as to the company's future. The report and accounts were unanimously adopted."

GENERAL MINING NEWS.

NOVA SCOTIA.

Springhill, N.S., Dec. 2.—A telegram has been received here from the executive of the Dominion Steel Company to the effect that no change of policy will be made on the part of the company with respect to the strike situation. The United Mine Workers have taken the communication into consideration.

The terms of the acquisition by the Dominion Steel Corporation of a controlling interest in the Cumberland Coal Company at Springhill were made known to-day. There were outstanding $900,000 six per cent. Cumberland Bonds, for which the Steel Corporation paid $120, in five per cent. Steel Bonds. For the $2,000,000 of Cumberland common stock Steel paid $600,000 par value in Steel common stock, which has a market value of $360,000. In all, the Cumberland people received in securities about $1,800,000.

QUEBEC.

Montreal.—Mr. J. H. Plummer has given out the following statement: "It has been arranged that a controlling interest in the stock of the Cumberland Coal & Railway Company will at once be transferred to the leading directors of the Dominion Steel Corporation. There will be for the present no change in the local management. The general policy to be pursued will be that in force in the Dominion Coal Company." This announcement of the President of the Dominion Steel Corporation is of the greatest importance, as it hitches up a valuable property with the greatest steel company in the Dominion, and will no doubt bring to an end the unfortunate strike at Springhill, which has been on for over fourteen months. The securities of the acquired company are a bond issue of one million dollars, and two million dollars of stock, and although the directors have taken the controlling interest personally, it will, of course, be eventually merged with the big company. The company's policy is to secure the largest coal areas possible in anticipation of a very great steel industry, and the statement is made that the railway from Springhill Junction to Pugwash will be at once carried on to completion.

Montreal.—At a three-hour meeting of Amalgamated Asbestos directors, Mr. R. M. Aitken, of Kitcat & Aitkin, London, England, was elected a director, representing large English interests. There were present at the meeting Mr. Thomas McDougall, in the chair; Hon. Robert Mackay, H. E. Mitchell, H. H. Melville, Percy P. Cowans, J. McIntyre, Hon. James Beck, and R. M. Aitkin. The organization is now being gradually whipped into shape, and it will be the aim of the directors to extend the scope of the company's operations, and put the pruning knife into the expense accounts. The directors decided to begin upon themselves, and directors' fees were reduced to the vanishing point. Among other things it was decided to change the company's fiscal year in order to make it end December 31, instead of May 31, as at present.

ONTARIO.

Cobalt.—The statement that Little Nipissing mine last week shipped a car of high-grade ore to the amount of 63,000 pounds, is incorrect, the shipment being mostly ore from the Coniagas mine. The car was made up of 17¾ tons from the Coniagas mine and only 13¼ from the Little Nipissing mine.

Toronto, Dec. 2.—The decision of the Ontario Government to extend the T. & N. O. Ry. into the Porcupine gold camp, is expected to give an impetus to wild-catting operations in the way of mining promotions, and there are evidences that it has already done so. However, it is intimated that the Government will get after the wild-catters with a big stick. Hon. Frank Cochrane, Minister of Lands and Mines, leaves next week for a personal inspection of the projected railway route and the whole Porcupine field as at present developed. It may be taken for granted that the new sections of the Ontario Companies Act dealing with flotations of speculative companies and sales of stock will be rigorously enforced, particularly in so far as they affect the issue of prospectuses, advertisements, commissions, and sales of stock. Under the provisions all commissions paid to sales agents must be authorized by letters patent and disclosed in the prospectus. Shares or capital cannot be directly or indirectly applied in payment of commission except as authorized. No subscriptions for stock shall be binding upon the subscriber unless, prior to subscribing, he shall have received a copy of the prospectus.

Ottawa, Dec. 6.—The advent of winter has caused the small mica mines in the Gatineau district to close down. They are not deep enough to allow of working in cold weather. The mica market is quiet, no big sales or shipments being reported. Local mica men expect a very dull winter, as most of the big firms using the mineral have been well stocked.

Cobalt, Dec. 7.—From four shafts last month the Nipissing mined $200,851 net and shipped $398,410 also net, or after estimated treatment and freight charges had been deducted. Of the total of $200,851, $84,000 came up the Fourth of July shaft alone. The month of November was a most noteworthy one for Nipissing in the form of discoveries of new ore underground, and the increasing of ore reserves. The discoveries included the new vein at the Kendall, the discovery of ore at the shaft of the top of No. 12, and the new leads on No. 164. Any one of these would have been important, and have added very considerably to the Nipissing's value.

Cobalt.—It is understood that the Peterson Lake and Nova Scotia directors have entered into an agreement whereby all ore in the disputed territory will be run through the Nova Scotia mill and shipped, the proceeds being retained in the Peterson Lake treasury until the courts decide how it shall be apportioned.

BRITISH COLUMBIA.

Nelson, B.C.—The force of men on the Rambler-Cariboo was doubled December 1st. There are 32 men at work on the mine at present and the management has decided that double the amount can be used. Ore has been opened up on 7, 8, 9 and 10, and drifting is being done on the 1,050 level. Upraises from 9 to 8 and from 12 to 10 are under course of construction, and all the ore that can be handled is being taken out. Winter quarters, which were burned out in the fire this summer, have been rebuilt. The concentrator will be moved down the hill below the compressor and a tram built three miles to McGuigan as soon as the railroad, which was also burned out, has been rebuilt to that point. Over $9,000 has been expended on the property since the fire.

Phoenix, Nov. 29.—George Gill and Joseph Christian were victims of a premature explosion at the Rawhide mine. Christian will recover, but Gill's chances are very doubtful. They were setting off a blast in the mine and the fuse when lit ran very rapidly to the dynamite, which was discharged prematurely with the men but a few feet away. Both men were badly burned and bruised by flying rocks and now lie in the hospital.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

There has been issued from the Home Office Part III. of the General Report and Statistics for 1909 dealing with Mines and Quarries. Mr. R. A. S. Redmayne, Chief Inspector of Mines, states that the average price of metals for the year showed little alteration compared with the figures for 1908, but towards the close of 1909 there were signs of improvement, especially in the case of tin, which was more than £20 per ton higher in December than in the preceding January.

The report states that the total value of the minerals raised during the year amounted to £119,394,486, a decrease of £10,609,184 as compared with 1908. This decrease is mainly accounted for by the decreased value of coal. The total output of coal was 263,774,312 tons, and the value £106,274,900, showing an increase of 2,245,517 tons and a decrease of £10,323,948 respectively on the figures for 1908. The average price of coal was 8s 0.7d per ton in 1909, as compared with 8s 11d in 1908. The quantity of coal exported, exclusive of coke and manufactured fuel and of coal shipped for the use of steamers engaged in foreign trade, was 63,076,799 tons, an increase of more than half a million tons on the exports for 1908. France received over 10 2-5 million tons, Germany over 9 2-3 million tons, Italy over 9 million tons, Sweden nearly 4 million tons, Russia nearly 3 1-3 million tons, Egypt, Spain and Denmark each over 2½ million tons, and the Netherlands and the Argentine each over 2 millions. Adding the 3,246,300 tons exported in the form of coke and manufactured fuel, and the 19,713,907 tons shipped for the use of British and foreign steamers engaged in foreign trade, the total quantity of coal which left the country was 86,037,006 tons. The amount of coal remaining for home consumption was 177,737,306 tons, or 3.949 tons per head of the population. The quantity of coke obtained in the year was 18,867,149 tons, valued at £11,896,913; and 1,511,645 tons of briquettes, valued at £978,498. The combined values of the output of clay and shale, igneous rocks, limestone, oil shale, salt, sandstone and slate for 1909 exceeded 7¾ millions sterling. Of the metallic minerals raised in the United Kingdom, iron ore took the lead, the output being 14,979,979 tons, valued at £3,689,777. The ore yielded 4,802,163 tons of iron, or more than one-half of the total quantity of pig-iron made in the country. Gold, lead, silver and tin all show an increase from British ores, whilst copper, iron and zinc each exhibit a decrease in the production for 1909, as compared with the preceding year.

The official returns of British salt shipments for last month show a total of 48,880 tons, an increase of 12,469 tons. The chief increases are 5,000 tons United States, 3,000 tons Sweden and Norway, 1,000 tons Holland and 1,600 tons Denmark. Liverpool increased its shipments by 3,000 tons, Runcorn, Weston and the Ship Canal were 5,000 tons better. Middlesbrough shows an increase of 4,667 tons. Fleetwood fell away by 1,956 tons. The ten months' salt trade totals 773,979 tons, an increase of over 75,000 tons.

The South Wales coal strike was marked by several important features late in November. On the one hand there was a report, on the authority of Mr. Matt Morgan, that he, with Mr. W. Abraham, the miners' President, and Mr. Onions, the treasurer, are to meet Mr. Askwith, of the Board of Trade, in London,

with a view to the continuance of the peace negotiations. On the other hand, the general conference called by the strikers and held at Cardiff decided to request all the lodges in the coal field to send delegates with a mandate to vote for or against a general strike throughout Wales. The vote on this point will be taken at the adjourned conference at Cardiff. The conference of November 21st, which was repudiated by the Miners' Federation, who recommended all Federationists to abstain from attendance, was of a fairly representative character, being attended by 100 delegates from almost every part of the coal field. This policy of a general strike was strongly recommended but most of the delegates said they could not vote on that question, as their lodges had not given them a mandate to that effect. In that way the conference came to be adjourned, in order that the lodges might be specifically asked to instruct their delegates upon the question of a general strike. The whole morning was spent in receiving reports from the collieries in the affected area. These were generally to the effect that the workmen were idle because they "refused to work for wages and under conditions that no self-respecting men should tolerate." They alleged that the "oppression of the employers had become intolerable," that the conditions were "inhuman," and that when workmen, after hard and honest toil, had failed to realize more than a few pence per day, the employers had chosen to brand them as loafers, or told them to limit their families to suit their scanty earnings.

BELGIUM.

The imports of petroleum products into Belgium during August amounted to 21,471 tons, compared with 19,810 tons in August, 1909. For the eight months to the end of August the total imports were 135,825 tons, against 242,589 tons for the corresponding period of last year.

AUSTRIA.

The Austrian Government has communicated to the press the following statement which is of considerable interest to all shareholders in oil producing companies operating in Galicia: "The Government proposes to open an investigation for the purpose of discussing the crisis in the petroleum industry. This investigation is now fixed by the Ministry of Commerce for Monday, 28th instant, at 10 a.m., in the session hall of the Vienna Chamber of Commerce. Invitations to take part in this have been sent to representatives of the crude oil producers, refiners, wholesale and retail dealers in oil and a series of oil experts. With each invitation was enclosed a sheet of questions, marking out the following programme for the discussions: 1. The present position of crude oil production, of the refining industry and the trade in kerosene. 2. The situation as to prices from the consumer's point of view. 3. Is it necessary at the present time to introduce any special measures to place the mineral oil industry on a sound footing? In case of an affirmative reply, what measures are suitable for the purpose, which do not entail the burdening of the consumer by excessively enhanced prices? 4. What attitude should be taken with regard to the export business, and what means should be adopted in its support?

RUSSIA.

The total production on the four main areas of the Baku district during September amounted to 37,100,000 poods, against 43,700,000 poods produced during September, 1909, and 43,200,000 during August, 1910. The total production for the nine months of this year amounts to 364,200,000 poods, against 368,000,000 poods produced during the corresponding period in the preceding year.

SOUTH AFRICA.

A cablegram from Johannesburg states that during October the mines of the Rand alone (that is, excluding outside mines) crushed 1,868,718 tons, the average yield per ton being 28s, the working costs per ton 17s 9d, the profit per ton 10s 3d, and the aggregate profit £952,161.

AFRICA—GOLD COAST.

The Governor of the Gold Coast reports that the output of gold from the colony, including Ashanti, during the month of October amounted to 13,954 ozs, values at £58,008.

UNITED STATES.

Cripple Creek, Colo., Dec. 1.—The report on output and total bullion value of ores from the Cripple Creek mining district in November shows 74,180 tons treated, some 20,000 tons being handled by mills in the district. The average value per ton ranged from $3.5 to $65. The total value was $1,381,050. There was a general increase in the amount of ore handled at the several mills. The tonnage this month is about 4,000 tons more than last month and the gross bullion value is about $45,000 greater than that of October.

Cripple Creek, Colo., Dec. 3.—In November 60 cars were shipped out by the leasers and company from the Hull City shaft of the Vindicator Consolidated Company's estate. Of this amount 45 cars were shipped by lessees, the grade of ore being milling class, while 15 cars were shipped by the company from this shaft with better results. There are 10 sets of lessees in the shaft and all are in ore. Each contributes about the same amount toward the output. The 60 cars totalled better than 1,500 tons. A good deal of development work is being done by the company, especially on the lower levels.

Ouray, Colo., Dec. 1.—The regular quarterly dividend of a shilling a share, or 20 per cent. yearly, declared by the Camp Bird, Limited, attracts attention periodically to the earnings of a typical Colorado gold mine, but these dividend statements fall considerably short in representing the actual profits of the undertaking. Up to the end of the fiscal year ended April 30, 1910, the total of dividends paid was £1,287,000 (approximately $6,253,000) or 155 per cent. In five of the eight years since the acquisition of the property by the present owners the dividends were 20 per cent.; in the other three they were 27½, 15, and 12½ per cent. The smaller dividends for two years are accounted for by the heavy expense for construction made necessary by the destruction of the mill.

Butte, Mont.—The Butte district is maintaining its output of copper at 23,000,000 to 24,000,000 pounds a month, and about 22,000,000 pounds of that represents the production of the two Anaconda Company smelters. In November the total production was 23,700,000 pounds. The Anaconda Company changes its output of various mines to meet exigencies. At present the mines of the Butte Coalition department are at the lowest point of ore production in several years.

Antlers, Okla., Nov. 28.—Fourteen miners were killed or entombed in a mine 20 miles north of here to-day. Five bodies have been recovered. Nine men were entombed in the mine and Secretary Thomas of the mining company, says there is no doubt that all were killed. The five men whose bodies have been recovered were thrown from the mouth of the mine more than 100 feet into the air. The cause of the explosion has not been determined but it is believed to have resulted from gas formation. The mine is the property of the Choctaw Asphalt Company, of St. Louis.

Washington.—Expressing it as his opinion that the want of cheap fuel and the delay in opening the Alaska coal fields are the strongest adverse factors in the present problem of territorial progress, Governor Walter F. Clark, of Alaska, in his annual report to the Secretary of the Interior, declares that "the ill-advised policy of forbidding all development of the large coal resources of Alaska, or of placing such restrictions upon development as to make the embarkation of private capi- approximated 19,000 tons. This is about the average for the past four months.

tal impossible, is to be deprecated, while the policy of conservation by proper use is to be encouraged. This coal," he says, "is needed for the industries of the territory and for the physical comfort of our people, and on no account should it be withheld from those uses." The present impossibility of mining coal, either under title or lease, he explains is in a measure responsible for the suspension of one of the principal railroads. This has caused a general feeling of discouragement over the business situation in those parts of Alaska where development and settlement ought to be going on most rapidly. Governor Clark says it appeared in public discussions of the subject that the opposition to opening the Alaska coal fields "springs chiefly from two sources—those persons who fear a monopoly and those who would have this coal held as a reserve supply for the future." He further says that while the present coal-land law is not a good one "it certainly lends no hope to monopolists, but rather is calculated to discourage the embarkation of capital."

ALASKA.

Valdez, Alaska, Dec. 3.—The wild scramble for claims continues here. With the near approach of cold weather, the amateur as well as the seasoned prospector, is making use of every minute of daylight to place his monuments on unstaked ground. The snowfall along the coast range in this section is very heavy, and once the white blanket covers the hills, prospecting and claim staking will be at an end. Realizing the necessity of quick action, those who have not placed their names on location monuments are scouring the hills in search of paying lodes.

STATISTICS AND RETURNS

N. S. STEEL AND COAL—NOVEMBER.

The Nova Scotia Steel & Coal Company reports for November and for the year to date as follows: Coal mined—In November, 77,450 tons; year to date, 787,788 tons; increase over same date in 1909, 35,500 tons. Iron ore mined—November, 57,362 tons; year to date, 459,000 tons; increase, 39,500 tons. Pig iron made—November, 7,550; year to date, 60,894 tons; increase, 7,700 tons. Steel ingots cast—In November, 8,274 tons; year to date, 69,331 tons; increase, 10,200 tons. Billets cogged—In November, 6,376 tons; year to date, 53,079 tons; increase over 1909, 4,700 tons. Bars and plate rolled—In November, 4,487 tons; year to date, 45,597 tons; increase, 4,600 tons. Number of axles shipped—November, 2,099; year to date, 31,845; increase over 1909, 7,800.

DOMINION IRON AND STEEL OUTPUT.

The production of the Dominion Iron & Steel Company, Limited, for November was as follows: Pig iron, 23,122 tons; steel ingots, 26,625 tons; blooms, 23,083 tons; rails, 13,425 tons; rods, 7,488 tons; shipments, 19,925 tons. The output of coal at the Dominion Coal Company, Limited, collieries for the month was 325,000 tons.

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending December 2nd, and those from January 1st, 1910, to date. The shipments were made up of 15 cars of high grade and 16 cars of low grade ore.

	Ore in lbs. Dec. 2.	Ore in lbs. Since Jan. 1.
Beaver	54,160	280,377
Buffalo	61,490	2,238,478
City of Cobalt	....	608,875
Chambers-Ferland	64,000	1,655,300
Cobalt Central	....	293,286
Cobalt Lake	....	415,200
Cobalt Townsite	....	665,120
Colonial	....	309,730
Coniagas	74,880	2,145,416
Crown Reserve	....	5,526,840
Drummond	460,000	2,884,200
Hargraves	....	564,070
Hudson Bay	....	481,215
Kerr Lake	254,570	9,494,728
King Edward	....	263,406
La Rose	259,250	10,010,141
McKinley-Darragh	202,100	4,147,149
Nipissing	398,380	12,040,787
O'Brien	....	1,179,360
Peterson Lake (Little Nip)	63,580	561,000
Provincial	40,000	105,000
Right-of-Way	80,460	1,749,747
Rochester	....	60,750
Silver Cliff	....	321,400
Standard Cobalt	....	258,951
Temiskaming	....	1,973,350
Trethewey	....	1,000,890
Waldman	....	63,992
Wyandoh	....	48,300

Ore shipments for the week ending December 2 were 2,012,870 pounds, or 1,006 tons.

Total shipments from January 1 to December 2 were 61,347,058 pounds, or 30,673 tons.

COBALT BULLION SHIPMENTS.

The bullion shipments from Cobalt for the month of November were the largest in the history of the camp. One hundred and seventy-six bars were shipped, the weight being 157,556 ounces, and the value declared at $87,243.41.

The total shipments to date now read as follows:

	Ounces.	Value.
O'Brien	301,770	$169,824
Nova Scotia	129,999	77,250
Buffalo	110,924	56,749
Temiskaming	68,230	33,794
SCrown Reserve	60,931	32,891
Crown Res (Silver Leaf)	3,728	1,173
La Rose	44,057	23,339
Cobalt Gem	10,800	5,800
Beaver	3,168	1,820
Colonial	1,008	623
Campbell & Deyell's sampling works, name of mine not disclosed	1,264	539
	735,879	$403,802

COBALT SHIPMENTS BY MONTHS.

Ore shipments from Cobalt camp for the month of November were 3,864.68 tons, divided among 22 mines, and for the eleven months 29,993.06 tons, a gain over the same period last year of 2,936 tons, not including $403,802 worth of bullion shipped, a very substantial increase.

The gain of November, 1910, over November, 1909, amounted to 1,400 tons.

The shipments by months for the first eleven months of the year now read:

January	2,025.06
February	2,248.99
March	2,594.78
April	2,814.08
May	2,243.17
June	2,917.00
July	3,168.46
August	3,111.89

September	2,183.10
October	2,876.85
November	3,864.68
Total	29,993.06

McKinley-Darragh's November output was over 320,000 ozs, and the management confidently expects that the total production of silver for the year will be over two and a half million ounces.

TORONTO MARKETS.

December 8.—(Quotations from Canada Metal Co., Toronto).
- Spelter, 5.50 cents per lb.
- Lead, 3.70 cents per lb.
- Antimony, 8 to 8½ cents per lb.
- Tin, 40 cents per lb.
- Copper, casting, 13.50 cents per lb.
- Electrolytic, 13.50 cents per lb.
- Ingot brass, 8 to 12½ cents per lb.

Pig Iron (Quotations from Drummond McCall Co., Toronto).
- Summerlee No. 1, $23.00 (f.o.b. Toronto).
- Summerlee No. 2, $22.50 (f.o.b. Toronto).

ON TIME

One of the most important business transactions which sensible minded men should perform on time is that of making proper provision for those who are dependent on them for the necessities of life.

The only way to do this is by means of life insurance. The only way to do it on time is to act now while in health. The most satisfactory way is to insure at once in the

Mine Management

Our organization offers many advantages to investors and mine owners seeking competent management. Under our scheme of management a continuity of policy is assured regardless of changes in the local staff. We are willing that our compensation depend upon results obtained. We know that our methods mean low working costs and maximum profits. Let us make you a proposition.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Book Dept. CANADIAN MINING JOURNAL, Confederation Life Building TORONTO

The Davis Handbook of the Cobalt Silver District

by H. P. Davis

Illustrated with Photographs

PRICE

Paper Cover = = $1.50

Stiff " = = = $2.00

¶ The first section of this volume is an outline on the Geology, Mining Treatment and Marketing of the Ores of the Cobalt District, the object being to give all the data and general information necessary to guide investors, brokers and professional men generally.

¶ Included in this volume is a complete and accurate directory of all mining companies operating or organized to operate in the Cobalt Silver District of Ontario.

¶ Full information as to capitalization, directorates, locations and conditions of properties is given. Tabulated statements of production and dividends revised up to January, 1910, are included.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

MINING & SCIENTIFIC PRESS

Controlled by T. A. RICKARD — **Established 1860** — **Published weekly at San Francisco, Cal.**

In every issue valuable articles are published on mining, metallurgy, and geology, the latest news from special correspondents at the principal mining centers, letters giving the ideas and experience of successful men, and other items of useful knowledge.

THE MINING MAGAZINE

Established September, 1909

T. A. RICKARD, Editor — **Published monthly at London, England**

A monthly magazine is the natural corollary of a technical weekly. It permits of more deliberate and more extended notice of matters concerning which the news element is less important.

The Mining Magazine includes a review of the world's progress in mining, metallurgy and economic geology, written by men who have personal knowledge of the regions and conditions discussed.

Prospecting, Locating and Valuing Mines

By R. H. Stretch, E. M.

Not only prospectors but all investors in mining properties should own this book. It is a safe guide and an invaluable reference work. It is the *standard*. Ten thousand copies have been sold. It is full of facts and data. It tells you all about

Mines—and mistakes in mining.
Mineral Deposits and Veins and how to detect them.
Locations and Patents.
Preliminary Development of Mines.
Discussions of Various Minerals.
Useful Tables and Diagrams.

Cloth, Library edition, $2.00 net, postpaid
Leather, pocket size, $2.50 " "

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

Baldwin-Westinghouse
Electric Mine Locomotives

Economical Mine Operation

and modern methods demand that you use electrical equipment. The same power used for cutting and drilling, is also used for hauling.

Service Records show that you should use **Baldwin-Westinghouse Mine Locomotives.**

Let us tell you more about them, and give you figures on their records in some large mines.

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

Three Post Magneto Electric Blasting Machine

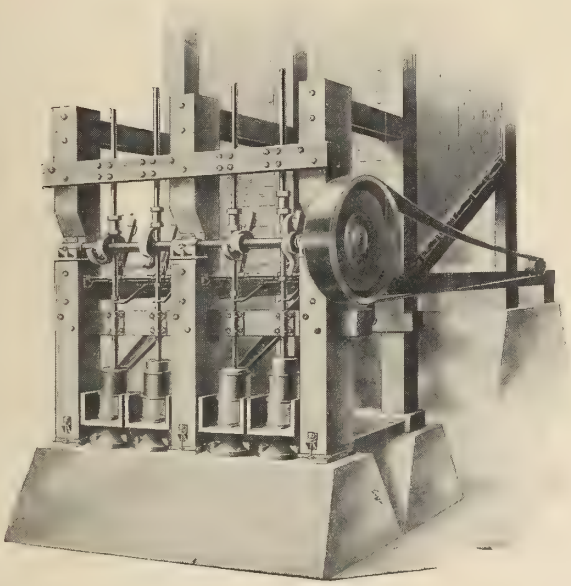
NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE



Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

The Nissen Stamp Mill

Nissen Stamp Mill

STAMP. The Nissen Stamp drops with great crushing effect upon a feed comparatively free of the fines caused by preceding impacts. This causes a natural splash which radiates from the centre of the die, carrying the pulp to a circular screen, every aperture in which presents a full opening for the pulp which has already reached size to pass through. As the stamp ascends preparatory for the succeeding blow, a partial vacuum is formed under the stamp shoe, which greatly assists the rapid return of the oversize to the die. This condition, the circular form of mortar, and the ascending stamp, lead to a suction effect which hastens the return of oversize to the die, a feature distinctive to the Nissen Stamp. Thus, a greater number of effective drops per minute is possible, resulting in greater capacity.

FEEDER. Each Nissen Stamp is provided with a tappet driven, automatic ore feeder of the Challenge type. This feeder is easily adjusted for different rates of feed, and is very sensitive in responding to the action of the stamp.

MORTAR. The Nissen Mortar is circular in plan and made to accommodate but one stamp, thus confining the crushing zone to a field of activity which forbids pulp coming to rest or becoming sluggish in that circulatory movement essential to efficiency.

The screen of the Nissen Mortar is circular and extends more than half way around the mortar, forming an area of discharge for one Nissen Stamp equal to about two-thirds that employed for five stamps of the old type.
